AUTHOR	Yearout, Robert D., Ed.
TITLE	Proceedings of the National Conference on Undergraduate Research (11th, Austin, Texas, April 24-26, 1997). Volumes I-V.
INSTITUTION	North Carolina Univ., Asheville.
PUB DATE	1997-07-00
NOTE	2045p.
PUB TYPE	Collected Works - Proceedings (021)
EDRS PRICE	MF18/PC82 Plus Postage.
DESCRIPTORS	Artists; Authors; Biology; College Students; Engineering Education; Higher Education; Humanities Instruction; *Intellectual Disciplines; Mathematics Education; Physical Sciences; Social Sciences; *Student Research; *Undergraduate Study

ABSTRACT

This set of proceedings documents includes 407 papers representative of the 1,825 papers and posters presented at a conference on undergraduate research. Volume I contains papers on the arts and humanities. Examples of topics include collaborative art, music composition using computer technology, interpreting Roman morality, gay marriage, and individual analyses of many artists and authors. Volume II contains papers on the social sciences. Sample topics are: anthropological and archaeological research, local cultures, early childhood development, dress and nonverbal communication, learning disabilities, depression in the elderly, and political trend analysis. Volume III is on mathematics and engineering and includes such topics as: groundwater nitrate removal, computational electromagnetic scattering, irrigation in developing countries, life-cycle cost analysis, methods of software specifications, and Godel's incompleteness theorem. Biology is the subject of Volume IV and papers cover such topics as: postanesthesia nausea, the human condition in antiquity, habitat selection by American kestrels, and antifungal resistance in opportunistic fungi. Volume V contains papers on the physical sciences. Examples of topics are: electromagnetic field profiles of biomaterials, a method for investigating field disturbances, magnetic resonance imaging techniques, and urban forests and wildlife. (Individual papers contain references.) (DB)

THE UNIVERSITY OF NORTH CAROLINA at ASHEVILLE
JULY, 1997

Foreword for the

Proceedings of the Eleventh National Conference on Undergraduate Research

University of North Carolina at Asheville
April 24-26, 1997

The University of Texas at Austin was pleased to host the 1997 National Conference on Undergraduate Research, affirming its commitment to excellence in undergraduate education and to the research experience in particular. Over 2100 students and faculty attended some 1500+ oral, poster and performing or visual arts presentations scheduled over April 24-26. A special feature of NCUR '97 was a series of more than 30 presentations by faculty members from all disciplines demonstrating the integration of research and teaching with the new technologies. These presentations were capped by a performance on Saturday night of "Ears and Feet," a concert of new interdisciplinary work by student and faculty composers, choreographers, dancers and performers from the UT College of Fine Arts. Electro-acoustic music and modern dance explored interactivity of disciplines and technologies by allowing dancers' movements to control electronic music and robotic lighting by way of a touch-sensitive computer dance floor.

President Robert M. Berdahl opened the conference quoting a Chinese proverb: "I hear and I forget. I see and I remember. I do and I understand." Berdahl praised the research experience as the most practical and potent method to provide students the perspective of inquiry, innovation and exploration as they prepare "for a future that is not so much known to be uncertain, but instead, certainly unknown." That facts and methodologies become obsolete in a world in which developments and advances occur with dizzying rapidity points to the importance of incorporating research activity into the undergraduate experience.

Dr. Berdahl also praised the student-faculty relationships that are fostered by the research process, congratulating the faculty mentor for serving the educational needs of the talented and motivated students by participating in the adventure of exploration and discovery, of cooperation and collaboration which characterize academic life.

Five distinguished plenary speakers addressed conference participants throughout the three days. Dr. Steven Weinberg, Nobel laureate in physics and professor at the University of Texas at Austin, challenged listeners to consider the future of science by posing the questions "The End of Science?". Dr. Robert Williams, Director of the Space Telescope Science Institute, dazzled the audience with the most recent images from the Hubble Space Telescope. From the vastness of space to the minute complexity of genetic research, Dr. Steven McKnight of the UT Southwestern Medical Center at Dallas introduced conference participants to the fascinating work being done in gene regulation and cell differentiation. Friday night's fete "Texas Culture Swing" featured, in addition to an outstanding sampler of culinary and musical styles of the Lone Star state, a mini-plenary address on the multifaceted aspect of Texas border cultures by Dr. Rolando Hinojosa-Smith, distinguished author and professor of Creative Writing. NCUR 97 closed with a resounding standing ovation upon conclusion of "The Challenge of Leadership" by Sarah Weddington, J.D., former Texas legislator and White House assistant, now author, lecturer and adjunct professor.

The University of Texas at Austin is proud of the privilege to share our campus for these few days with the distinguished group of students and faculty whose work is presented here in published form. We congratulate you for your accomplishments and encourage you to continue to participate in the challenge of research.

Susan Wells Howard, Chair, NCUR '97

PREFACE

The 407 papers published in these five volumes are representative of the approximately 1825 papers and posters presented at the celebration of undergraduate research that was NCUR '97'. The faculty, staff and students of the University of Texas at Austin are to be commended for making NCUR '97' such an enriching experience. The student authors deserve recognition for their hard work and for their persistence in seeing their research through to its final publication.

Special thanks are extended to Dr. Susan Howard, Ms. Kelly Johnson and other members of the NCUR '97' staff. Their help during the days of the Conference was invaluable. Many thanks also to the members of the National Board, who reviewed a large number of papers submitted to the Proceedings under time constraints. Their continued efforts to standardize has raised the Proceedings quality. This project would have not been successful without their assistance.

I would also like to thank the UNCA Editorial Board, who put in many long hours reviewing, checking and organizing papers, and Tracy Walker, and Adam Bradley, who did all the cutting and pasting necessary for these volumes. I owe a special debt of gratitude to Katherine Whatley, Tracy Walker and Mila Cleverdon for their support, encouragement, and mentorship during the entire process of organizing the Proceedings.

To all the students who submitted papers to the Proceedings go thanks for their participation and congratulations for their achievements. Your enthusiasm and achievement will serve as role models for the next group of student researchers - whom we look forward to meeting at the Twelfth National Conference on Undergraduate Research at Salisbury State University, Salisbury Maryland.

COLLABORATIVE ART A MOVEMENT IN THE TWENTIETH CENTURY

Faculty Advisor Jane-Allen McKinney

Collaborate means "to work together, especially in a joint intellectual or artistic effort." People have collaborated on artistic endeavors since prehistoric times. The Neolithic artwork, Stonehenge, in England could only have been a collaborative act, and the same is true of the ancient Egyptian pyramids. In fact, almost every monumental, artistic effort in our past must have included more than one person's strengths and abilities. Whether the actions were manual or intellectual, creative or mechanical, the workings of more than one individual had to have been involved to create such lasting beautiful, monumental works.

In the second half of the twentieth century, some people began to promote the idea that working together could be beneficial for both the artist, and the artistic work. While certain social forces made collaboration easier, more importantly, this artistic movement created social change. Collaborative art became an expression of political activism for the feminist movement, as well as allowing individuals the opportunity to give back to the community education, respect for society, and awareness for environmental changes. This account will begin with the "Happenings" in the late 1950's and move through the second half of the twentieth century. Included will be some of the main collaborative artistic endeavors which were either influenced by society or brought about some identifiable social change.

Regarding collaboration in artistic endeavors, a major turning point occurs in the late 1950's with the "Happenings." Many artists during this decade felt the need to go beyond gesture painting and junk sculpture (which was popular at the time) and because they wanted to "say" more. The first "Happening" was by composer John Cage. His 1952 "event" at Black Mountain College stimulated several other artists to collaborate and arrange other "Happenings." Allan Kaprow, Robert Whitman, Red Grooms, Claes Oldenburg, and Jim Dine were among many who became determined to present an artistic environment for the viewer.

Allan Kaprow, one of the leaders of this movement who "moved from the juxtaposition of found objects to the juxtaposition of found events," spoke about Jackson Pollock (known as "Jack the Dripper") in an article of 1958, "Pollock, as I see him, left us at the point where we must become preoccupied with and even dazzled by the space and objects of our everyday life . . . Not satisfied with the suggestion through paint of our other senses, we shall utilize the specific substances of sight, sound, movements, people, odors and touch. Objects of every sort are materials for the new art: paint, chairs, food, electric and neon lights, smoke, water, old socks, a dog, movies, and a thousand other things . . . " (Fineberg, p. 189)

Because the Happenings involved sounds, music, lighting, smells, time durations, found objects, and as Kaprow said, "a thousand other things," people had to work together. Art became an event, it was no longer "this" painting or "that" sculpture, but individuals contributing their particular expertise for the benefit of an overall outcome, a Happening. "Happenings were definitely the 'in' thing for a period. Everyone sensed the excitement and vitality of a genuine revolution in the definition of art. Yet because they did not leave museum objects and their lifespan was short, they may seem less important in retrospect than they actually were." (Fineberg, p. 189)

Even though collaboration became acceptable in the art world, in the 1950's, collaborative efforts that made important social statements, and became sources of social change did not occur until later in the twentieth century. Several collaborations including the works by Christo and Jeanne-Claude, "Womanhouse" by Miriam Schapiro and Judy

Chicago, "The Dinner Party" by Judy Chicago, and works by Russian artists Komar and Melamid are all endeavors that joined the works of individuals and facilitated them in becoming voices of social change. Each of these groups combined their talents to present ideas to the world, through artistic visual media, that made statements and stimulated change.

Christo, and his artistic partner, Jeanne-Claude (his wife), have created an overwhelming number of works that have a sophisticated understanding of the subtle political insight necessary to engage the public in critical debates on values. The 1960's centered on the realization that those with wealth and power could control democracy by shaping what people saw on television and read in the newspaper. Christo and Jeanne-Claude could compete with big business in shaping the public's perception of events. From "Running Fence" and "Surrounded Islands" to "Pont Neuf Wrapped" and "Umbrellas", the irrationality, startling scale, and presence of the work in the real world prompt us to look with a new understanding of ourselves and the world around us. Christo explained, "The project is teasing society, and society responds, in a way, as it responds in a very normal situation like building bridges, or roads, or highways. What we know is different is that all this energy is put to a fantastic irrational purpose, and that is the essence of the work." (Fineberg, p. 350)

While collaboration is taking place between a group of artists, there is a much larger, identifiable collaborative action going on with certain outside individuals during the course of the work. To make a work happen, Christo and Jeanne-Claude must include dialog with various people and show drawings to help them visualize the event. They further reinforce this with technical data including maps, photographs of the sites, engineering diagrams, and specifications. Then, the involvement of certain political and social forces are delicately interwoven into the artists' process. This interaction requires speaking with several different individuals at every point. In the end, the realization of each project depends directly on the outcome of that interaction. "Without winning the cooperation of the public, Christo could neither obtain the construction permits nor the commitment of the collectors, whose purchase of drawings, collages, prints, and small sculptures ultimately finances the work. He insists that people talk about his idea and as they do their involvement deepens." (Fineberg, p. 350)

Social statements are made in the process of the works. Collaboration is a vital part of that process. The artwork itself creates a need for passers-by to move out of their habitual ways of looking and thinking. "Everyone finds themselves doing their usual job, but now in relation to something that has no practical purpose - a work of art." (Fineberg, 350) Christo and Jeanne-Claude have created many monumental scale, site-specific, temporary artworks that are not a boastful attempt to shake up society, but rather a subtle nudge to enlighten the viewer.

While some artists worked collaboratively out of a need for change within the art community, and others worked to create a gentle social statement, some people were prepared to do what ever it took to make people listen! During the 1970's the feminist movement was at it's highest point of "waking up" society. Women were organizing, writing, speaking, protesting, marching, and involving the public in their fight for equality. Several artists during this decade worked diligently for change. Miriam Schapiro and Judy Chicago both taught at the California Institute of the Arts, and in 1972 set up the West Coast Women Artists Conference. Their most controversial project, "Womanhouse," was launched from Cal Arts with a number of their students and women artists from Los Angeles. It was the first all-female, collaborative art project.

Schapiro said, "Judy and I wanted to find a way beyond just talking. We consulted Paula Harper, a historian, and she suggested we put together a literal House that would embody all our ideas. We felt we were embarking on an adventure. We wanted to find out everything we could about this new race, this new culture: women. We wanted to understand their art, their fantasies, their limitations, their powers. . . It was like building the Parthenon: we were working out every step anew as we went." (Munro, p. 278)

The collaborative work "Womanhouse" helped wake up society and created an artistic voice, but perhaps the largest collaborative artistic impact on society occurred through the work of Judy Chicago's "The Dinner Party." For the first time a monumental artwork documented women's efforts (both artistically and historically) and stressed a need for equal historical representation for women. Before her efforts, there was little or

BEST COPY AVAILABLE

no information in the history books about women's accomplishments. Chicago stated, "When I started my investigation, there were no women's studies courses . . . While an undergraduate at UCLA, I took a course titled the Intellectual History of Europe. The professor, a respected historian, promised that at the last class he would discuss women's contributions to Western thought. I waited eagerly all semester and at the final meeting, the instructor announced 'Women's contributions to European intellectual history? They made none.' " (Chicago, p. 3)

"The Dinner Party" completed in 1979, is a monumental sculpture, that involved numerous media, including ceramics, china-painting, and needlework, to honor women's achievements. These art forms were chosen because they should have been recognized as more than women's crafts (historically created and displayed inside the home), they are artistic, creative endeavors previously ignored by the institutionalized art world. "The Dinner Party" is a three sided, triangular table with an open center, each side containing thirteen place settings, (thirty-nine total). Each commemorates a goddess, or historically important woman. On the white, ceramic, tile floor around the place settings, the names of other important, historic women are glazed in gold. Each place setting contains imagery that relates to the women or their accomplishments and the names on the floor are arranged around the settings according to place in history, or the type of historical achievement. While Chicago began this endeavor alone, she says, "I was struggling to formulate what was to become an overwhelming task and one that I could never have completed alone: I intended to create a work of art that could symbolize the immense amount of material about women's history that I was discovering." (Chicago, p 4)

As her concept for "The Dinner Party" developed, dozens of people came forward to help, some for a few days and others for several years. Slowly, teams evolved and women and men worked in groups on ceramics, needlework, research, graphics, photography, fabrication and fundraising. Each group had a supervisor chosen on the basis of skill and willingness to devote time and leadership. The grand artistic endeavor became a true collaborative effort that would create a major social change by pushing historians to include information about women. Of course the entire feminist movement in the 1970's created changes for women, but this particular piece of artwork was a drastic step for historical records and women gaining the recognition they deserved.

Another group of artists in the 1970's and 80's that fought social restrictions was the Russian collaborative group, Komar and Melamid. Prior to the breakdown of the Eastern Bloc in 1990, the repressive climate made it impossible for Russian artists to exhibit anything that varied from the official formulas. Komar and Melamid became close friends in art school, and in 1972, they decided to work collaboratively and make what they called "Sots" art. The term referred to "socialist realism (which was the old fashioned academic vocabulary in which they were trained) but it also alluded to American pop art by lifting socialist realism out of its ideological context just as pop art took the clichés of consumer goods and popular media out of their commercial context in order to manipulate them as icons of the culture." (Fineberg, p. 420) Later, in 1978, to gain freedom in artistic endeavors, the two emigrated to New York via Israel.

For the Moscow artists, socialist realism and many of the subjects it depicted had certain nostalgia that evoked the last years of the Stalin period. In their work "Stalin and the Muses" there exists a likeness to the bad lighting and poorly conserved old master paintings that hung in gloomy Russian museums. On the one hand, this realistic series of work creates a political satire, glorifying Soviet history, but it also embarks on a nostalgic quality. There is also a unique displacement of time seen in their works because of the lack of formal training beyond a realistic, classic, link to the old masters. However, because they created in a certain political, satirical style, they were overstepping the boundaries of Russian artists at the time and therefore, attempting to create change within society.

After covering the Happenings, which were created out of a need to change the art modes of the 1950's, and the various collaborative works that created social change, the final category of collaborative art covered in this account include those works that are public in nature and "give back" something to the community. While there are a number of examples for this group, Judith Baca's "Great Wall of Los Angeles" and "The Aids Quilt" were chosen because they are undeniably collaborative in nature and have stimulated contemplation, education, interaction, and awareness.

In 1976, Judith Baca began the "Great Wall of Los Angeles" with a mission to preserve a largely unwritten history. The "Great Wall" is an ongoing project of the Social and Public Art Resource Center (SPARC) founded by Baca, which declares in the mission statement, "public art is a vital part of everyone's culture because it exists where people work and live -- in schools, on public transportation, and in our visibility of work which reflects the lives and concerns of America's diverse ethnic populations, women, working people, youth, and the elderly." (Senie, p. 28)

The "Great Wall of Los Angeles" is a 2,435 feet mural which depicts a historical period from the dinosaurs to the start of the civil rights movements of the 1960's. "It depicts local history form the point of view of groups and events that have been traditionally ignored by the mainstream." (Senie, p. 28) The wall includes images of the Spanish arrival in 1769, the Gold Rush of 1848, waves of Chinese and Mexican immigrants in the later nineteenth century, World War I (emphasizing the role of women), Thomas Alva Edison (a native of Mexico), social conditions in Hollywood in the 1920's, the 1929 crash and depression, the Dust Bowl refugees, World War II, Jewish refugees, the 1950's (which includes the Red Scare, the division of the Chicano community, rock 'n' roll, the origins of the gay rights movement, and the Beats), Indian and Asian assimilation, and Olympic champions from 1948 to 1964.

The "Great Wall of Los Angeles" (its actual title is "The History of California") is the longest mural in the world, and evolved through research and labor. Each section of the wall (around 100 feet) takes a year to research, organize and execute. Baca supervised different artists and teams made up of mainly locally recruited adolescents. Teenagers from the area were chosen for various reasons, mainly, young people get involved and begin to feel ownership and respect for their neighborhood. Through the process of creation, rather than defacing their environment, they become attached and proud of their community, hopefully their actions will convince other young people into positive creation and interaction. Perhaps the message of the wall may be expressed more by the young people involved than those passing the monument itself. Sixteen-year-old Sergio Moreno, after his first summer on the project hoped "that when people see this mural they forget all their prejudices and try to live with all people, no matter what race, in peace." (Senie, p. 29)

In June of 1987, a small group of strangers gathered in a San Francisco storefront to document the lives they feared history would neglect. Their goal was to create a memorial for those who had died of AIDS, and to thereby help people understand the devastating impact of the disease. This meeting served as the foundation of the NAMES Project AIDS Memorial Quilt.

Cleves Jones officially started The NAMES Project AIDS Memorial Quilt after the gathering in San Francisco in 1987. Today, ten years later, over 41,000 individual 3-by-6-foot memorial panels have been sewn together by friends, lovers, and family members, and the Quilt represents only 12% of all U.S. AIDS deaths. There are 44 NAMES Project chapters in the U.S. and 39 independent Quilt affiliates from around the world. Since 1987, over 9 million people have visited the Quilt in thousands of displays worldwide. Through these displays, the NAMES Project Foundation has raised over $1.7 million for AIDS service organizations throughout North America.

The Quilt is the largest example of a community art project in the world, 24 football fields with a walkway between sections (15 without walkway), 26 acres with walkway (17 without). It was nominated for a Nobel Peace Prize in 1989. "Common Threads: Stories From The Quilt" won the Academy Award as the best feature-length documentary film of 1989. Jane Alexander, Chairman for the National Endowment for the Arts said, "The NAMES Project gives important and impressive testimony to a tragic blight. What more poignant demonstration of the power of art can there be?"

The NAMES Project AIDS Memorial Quilt not only calls for an immediate awareness, and education of AIDS, it allows individuals to collectively remember and pay tribute to those special people who have died of AIDS. The Quilt reinforces the fact that those who have been lost to the disease are family members, friends, lovers, coworkers, teachers, old, rich, poor, gay, straight, and bisexual - diverse - and richly unique, as is each panel.

> "Powerful and impressive, the AIDS Memorial Quilt has educated millions about HIV and AIDS. It is both a lasting memorial to those who have died and a compassionate cry for humanity to pay attention to the AIDS crisis." California Senator Dianne Feinstein. (America On Line)

The collaborative artistic endeavors covered in this account are a mere glimpse of the countless works that have been created by individuals working together. The commonalties within the groups chosen include a constant need for artistic endeavors to reach the public by stimulating thought processes and hopefully creating an active response, not just a quiet observance. While some individual works of art throughout history have also achieved this goal, perhaps utilizing information and creativity from others enhances the chances for success. Especially when the obstacle of social restraint is in effect, the completion of the work may call for a grouping of individuals to conquer that barrier. While collaboration has existed for thousands of years, it has only become an acceptable movement in art within the second half of the twentieth our century. The collaborative movement certainly has allowed for great artistic endeavors to create active social change within the framework of situations that are not easily addressed or defined. The work of Miriam Schapiro and Judy Chicago "woke up" both women and men about understanding the need for equality and the recording of women's achievements. Komar and Melamid challenged Russian classic artistic standards, Christo and Jeanne-Claude subtly nudged public opinion and encouraged viewers to become involved with the process of the event. Judy Baca's work incorporated young individuals in the intrinsic need for "giving back" historical information and raising public consciousness and, of course, the NAMES Project for the AIDS Memorial Quilt has created a dramatic artistic work that encourages individuals to pay tribute to their loved ones and at the same time educates and creates changes within society.

Debora Rindge

Helen Frankenthaler is a highly respected Abstract Expressionist artist born in New York in 1928. Her work is usually discussed in terms of the formal qualities of line, color, form, and composition due to her abstract compositions. Like most abstract art, discussion of subject matter is generally avoided. However, Helen Frankenthaler consciously titled her work in reference to landscape terminology, which indicates an awareness of her physical environment. Through abstraction and non-objective art, Helen Frankenthaler's oeuvre conveys a sense of natural or landscape-like subject matter through the Abstract Expressionist belief of the artist as creator and component of nature. According to Arts Magazine contributor Jerry Bowles, "No matter how abstract Frankenthaler's paintings get, they never quite lose their hereditary connection with the world of nature and its manifestations." (22) Her work is a reflection of her environment translated through an emotional lens into abstract compositions. As a non-objective artist, she denies this presence of subject matter in her work, but at many points in her life, subject matter, style, and medium have all changed according to and reflecting her physical environment. Following her beliefs, as well as those of the Abstract Expressionists, she sees herself as creating nature through art. In an interview with Mademoiselle magazine, Frankenthaler states: "...Nature covers a lot - not only geography, but your whole psychodrama." (344) Involving the human psyche incorporates her personality, emotions, and artistic creation into the concept of nature. Her concept of nature includes all life's experiences. The process of creating art, life, and beauty is included in the definition of nature as well as one's tangible surroundings.

To install a natural framework in her work, Frankenthaler emphasizes the qualities of order and beauty when creating a painting or print. Frankenthaler said in a discussion with museum curator Michael Carmean, "Anything that has beauty and provides order (rather than chaos or shock alone), anything resolved in a picture (as in nature) gives pleasure - a sense of rightness, as in being one with nature." (8) She refers to nature as an abstract state of mind that one can attain through formal manipulation of non-objective imagery.

As an inspiration for compositions of beauty, Frankenthaler often spent summers in the country away from her home and studio in industrial New York City. In the tradition of landscape painting, she often executes studies and sketches of the summer countryside, a practice not normally adopted by abstract artists. Many of her most highly regarded pieces come out of these times spent close to physical nature. (Elderfield 66) For example, Great Meadows (1951, watercolor on paper, 22" X 30") was inspired by and executed at a farm she visited in rural New Jersey during the summer of 1951.

Although Great Meadows is an abstract painting and an exercise in the formal qualities of line and color, art critic Ronny Cohen remarks that "Frankenthaler's paintings have the kind of presence that triggers associations." (115) Whereas many abstract paintings are appreciated for their formal properties, Frankenthaler's work causes the viewer to look for meaning. Meaning is sometimes found in the combination of the number of landscape references in her titles and their relevance to her physical location at the time of painting, encouraging a reading of her oeuvre in terms of landscape imagery.

The formal qualities of line, color, and composition help promote a sense of nature. Throughout the piece exposed paper and bleeding forms are created by the addition of excess water. These clean, white, exposed areas and the thin, pale colors encourage a summer sentiment. Occupying the center of the composition is a melange of golden yellow, ochre, brown, and orange denoting an abstract grassy field. Vertical blue and purple forms, surrounded by a band of red and diagonal green and black lines in the top left of the

BEST COPY AVAILABLE

composition, are reminiscent of trees or stick-like images. A circular area of ochre paint occupies the upper right corner, resembling a sun. Along the bottom, streaking up and towards the right are brown washed areas enclosed by a jagged black outline suggestive of a mountain range.

In 1952, Frankenthaler painted her best-known piece, an oil painting titled Mountains and Sea (7'3 5/8" X 9'9 1/4"). The watercolor principles of exposed paper and loose forms are now expressed in oil, which is unusual because traditional oil painting styles emphasize covering the entire canvas. She poured diluted oil paint on isolated areas of large unprimed canvas, manipulating the paint with sponges, sticks, or brushes to soak into and stain the raw canvas, a method titled the "soak-stain technique." Thinned paint creates the "halo" spreading from the paint onto the unprimed canvas and the luminescent, translucent colors found in Mountains and Sea. After a trip with prominent art critic Clement Greenberg to Nova Scotia in 1952, where she executed a number of landscape sketches, she returned to her New York studio to paint Mountains and Sea. The juxtaposition of mountain ranges in close proximity to the seashore was a striking image for her, the effect of which she reproduced in this piece. She wanted this piece to reflect not only a landscape but the whole experience of painting and creating a landscape. (Elderfield 110)

In the center of the composition, amorphous pale purple and blue shapes form abstract figures resembling rising mountain ridges or a bouquet of flowers. In the upper left, loose red lines spiral and stretch towards the corner like growing heather. Along either side of the composition stretches the suggestion of a blue horizon line. The bottom is occupied by blue, green, and pink areas bleeding into each other, creating a sunlit prism of color.

In the 1960s, Frankenthaler continued exploring the soak-stain technique and her personal expression of nature and beauty. Frankenthaler painted Seascape with Dunes (1962, oil on canvas, 5'10" X 11'8") while visiting Cape Cod in Massachusetts. The title reflects her awareness of her surroundings while the color juxtapositions and composition emulate properties of nature. The center of the piece contains two brown-green horizontal elements resembling sand dunes sandwiched between a stack of three red circular forms. Spiky, open green, blue, and brown streaks grow into the upper left forming irregular plant-like shapes. On the right, a flowery outline of purple surrounds blue and red vertical elements. The halo created by diffused paint, her choice of browns, greens, blues, yellows, and reds, and the raw exposed off-white cotton canvas promote a sense of sand and ocean.

Use of the new, plastic-based water-soluble acrylic paints of the 1960s in compositions such as The Bay (1963, acrylic on canvas, 6'8 3/4" X 6'9 3/4"), created special problems for Frankenthaler's painting style. This was one of Frankenthaler's early experiments with acrylic paint. Thinned oil paint has a tendency to bleed, blurring edges and creating new composite colors or forms. As a result of her use of acrylics, the forms in her work of the 1960s have more separate color areas. She pours excess water on the canvas to create irregular, crisp edges of color such as those found in The Bay. A luminescent flood of blue paint flows from the top of the composition to puddle in its center. Surrounded by the blue, a dab of orange provides a striking contrast and focal point. In the middleground, a horizontal band of green is painted around the blue. The last component added to the composition is a light gray wash along the bottom, providing a stable base and evoking a shoreline. On very rare occasions Frankenthaler titled her work before the piece was entirely complete. Usually she finished a composition and examined the piece to determine its title. However, The Bay was titled after pouring the flooding blue section which creates a sparkling blue lagoon-like puddle of paint. Her studio by the bay in Provincetown, Massachusetts, where she created this work, would have allowed her to see a number of views like this.

In 1964, Frankenthaler developed a more rectilinear format such as that in Interior Landscape (1964, acrylic on canvas, 8'8 7/8" X 7'8 5/8"). This rectilinear format became a regular motif of her mid-1960s paintings. A series of rectangular shapes radiates from an irregular tree-shaped central abstract form enclosed by a square blue field. Surrounding the blue field is a window-like jagged yellow frame, whose clearly defined edges are a result of acrylic paints. This is trapped by a dark area extending to the limits of the canvas. Of the title Frankenthaler said, "It's called Interior Landscape because that's what it is--an interior landscape--an abstract picture." (Carmean 42) Since "landscape" implies an exterior view, adding the word "interior" to the title brings the painting out of recognizable external influences and into the world of her imagination.

When expanding her experiments into printmaking and other media, she relied on the same principles of biomorphism and free-formed shapes found in her paintings. Printmaking allows her to experiment with other forms of nature; using vegetable and synthetic dyes on many different wood grains in combination with various types of paper brings out unusual but naturally occurring effects. East and Beyond with Orange (1973-74, 8-color woodcut, 31 1/2" X 21 1/2") incorporates natural wood texture and the abilities of different natural and fabricated dyes to enhance the composition.

In East and Beyond with Orange, the principal element is a broad panel of orange in the center of the composition. The placement of darker forms on the bottom right and left sides resemble canyon walls, creating a sunset effect when combined with the central glowing orange wash. Two darker vertical bands of orange on either side of the composition provide a frame, containing the scene. Tranquillity, calmness, and stability are inspired by this work.

Frankenthaler went to San Francisco in August of 1982 and worked with artist Garner Tullis in his experimental printmaking workshop. Tullis was a prominent figure in experimental printmaking techniques and provided Frankenthaler with technical assistance on her prints. She made several monotypes a day for four days, each set marked by an essential color. The weather during this week ranged from cloudy to stormy; the dominant color for each day reflects a mood inspired by the weather. On Tuesday the color was red and the weather was stormy, as seen in Bay Area Monotype: Tuesday I (1982, monotype, 21" X 31"). Although this monotype has no external references to landscape, the mood conveys an emotional translation of dark and tumultuous skies.

The central irregular circular forms are created by various hand-cut rubber blocks with soft, biomorphic edges, providing the same free-formed organic shapes found in her paintings, here evoking darkened clouds or turbulent seas. This series of monotypes has deeply embossed or debossed areas, depending on the placement of the rubber blocks on top of or under the paper. Although these embossed areas should be bare because the rubber blocks should prevent the murky black and red inks from touching the paper during printing, Frankenthaler often incorporates evidence of her presence as an indication of nature by way of her psyche through excessive ink that occasionally seeps into the paper covered by the blocks during printing. Frankenthaler commented that she and Tullis watched the printing press as rivers of ink poured out the sides when her plates went through. (Fine 28) The left side of Bay Area Monotype: Tuesday I displays a thick application of ink spilling over the edge of the work, evoking natural spontaneity and accident through deliberate application of materials. Throughout the piece an uneven distribution of ink causes the distinctive irregularities. The irregularities in dispersion of the red, black, and brown inks provide the emotional expression of the inclement weather during her stay in San Francisco.

By incorporating emotional translations of her physical environment into her work, Helen Frankenthaler creates non-objective art that resonates with a natural order. As an artist she is a part of nature; she is the creator of the natural properties of beauty and order. Her landscape titles indicate an awareness of external inspirations filtered through an internal, imaginative screen resulting in abstract color compositions. In abstract art there is an inclination to look for possible meanings, which is especially true in Frankenthaler's oeuvre. Frankenthaler says, "My work is not a matter of direct translations, but something is bound to creep into your heart or your head." (Carmean 36) The "something" that creeps into interpretations of Helen Frankenthaler's work is reinforced by examining the effect of her environment on the changes in her work. She took in the world around her, producing personal, imaginative, and natural abstract paintings and prints.

Frank Lloyd Wright and Michael Graves are two American architects whose influence on our culture has been tremendous. These artist's are well known for their individual accomplishments, however many similarities as well as differences exist among their works. Both artist's utilize strong horizontal and vertical lines in their designs complemented by vivid colors. In contrasting two styles, some of Wright's architecture is referred to as organic in such works as the "Solomon Guggenheim Museum" while his "Falling Water" is referred to as geometric, relating to the cantilevered porches. The geometric works of Graves bring a historical reference of the Neoclassical form to modern architecture relating to colored motifs and pilaster capitals in "The Portland Building" and the various homes designed. Other than architectural structures, both artist's are designers of carpeting, fabric, wallpaper, kitchenware, dinnerware, and furniture.

BACKGROUND

Frank Lloyd Wright was born in 1867 in Wisconsin to William and Anna Wright. Wright attended the University of Wisconsin in 1884 studying civil engineering for two years. He also gained experience working part time on a construction project at this University . In 1887, Wright moved to Chicago and became a draftsman for Joseph Lyman Silsbee, a Midwestern architect. While working with Mr. Silsbee, Wright designed his first home. In the later part of 1887, Wright became a designer for the firm Addler and Sullivan, under the supervision of Louis Sullivan (Encarta, F.L.Wright), whose ideas of incorporating nature and its function influenced many of Wright's work. Frank Lloyd Wright invented many things that were economically beneficial to the builder and to the consumer. Precast concrete blocks reinforced by steel rods allowed cheaper and faster methods of construction because of the use of concrete. Air filtration systems, indirect lighting , panel heating and an internal vacuum system convinced the consumer because now these systems were inside the home. (Encarta, F.L.Wright) Mr. Wright was known as an extraordinary and serious architect, but was criticized for his "unpredictable leaky ceilings." (Heinz, p.26) Frank Lloyd Wright created the principle of organic architecture which he stated was defined in six major design principals. "Simplicity and repose in detail and decoration, to design as many different styles of homes which emphasized the individuality of people, combining nature, topography and architecture, taking the colors of building from nature and adapting them to fit harmoniously with the materials of building, using the nature of materials and having spiritually integrity in the structures designed." (Riley, p.33) Wright's production of "geometrically intricate fabrics and wallpapers, lighting fixtures, glass window motifs, custom carpet designs,"(Flanagan, p.30) and furniture range from simple to complex.

Michael Graves was born in 1934 in Indianapolis, Indiana. Graves received his undergraduate degree at the University of Cincinnati and his masters at Harvard University. After Graves earned his masters degree in architecture he was awarded a two-year fellowship at the American Academy in Rome. Graves' drawing, painting skills and the use of Cubistic techniques influenced his ideas and designs as in the "The Portland Building". In 1962 Graves returned to the United States as a lecturer in architecture at Princeton University. Later he was promoted from assistant professor to associate professor, then to full professor in 1972. During that same year, Graves along with four other architects curated the book, "Five Architects."(Encarta, M. Graves) Graves' works range from hotels such as Disney World Epcot Center in Florida to small detailed jewelry and kitchenware owned by the average consumer. Examples from some of the masters such as Marcel Breuer with his "tubular steel", Josef Hoffmann with his "square forms and Rococo undertones", and LeCorbusier with his "inspired grid" allowed Graves' style triumphant success. (Collins and Papadakis, pp.124&127) Nevertheless, Graves as well as Frank Lloyd Wright was criticized for his personal and financial problems, but for his creativity. The worst insult from his critics, who were rival architects was that " Graves makes fun of objects and makes light of things." (Hirst, p.111) Others have been quoted as calling Graves work "designer garbage and "that he strictly does outlandish things for money." A sample of this would be the outlandish commercial ads for shoe companies. In his defense Graves feels that "household items designed by architects give the average person the chance to own affordable art."(Hirst, p.112) Michael Graves plans for the future include everything for the home and office. Many compliment his work stating that "Graves' witty historical style may be the key to his product success." (Hirst, p.112) I feel his creativity, carefree attitude, and architectural skill leave many others wondering what is left or next for Michael Graves.

STYLES AND TECHNIQUE

Frank Lloyd Wright, an unlicensed engineer, designed with space in mind. Wright not only designed the living area, but also styles of furniture that should be placed in the environment. Carpeting, dinnerware, kitchenware, lighting, wallpaper, fabrics, and furniture were many of Wrights famous talents. Michael Graves' creations and structures contain historically architectural elements such as columns, pillars, arches, and towers such as in the Dolphin Hotel in Orlando.(Craven, p.527) However, the oversizing and vivid colors used to express his uniqueness and creativity in his designs illustrate his Post Modern style. The works of

Graves, which include dinnerware, jewelry, kitchenware, lighting, carpeting, and furniture show the variety and skill of in using these technology of color and scale.

Frank Lloyd Wright's teapots, salt and pepper shakers, sugar and creamers set were elegantly designed for the Imperial Hotel in Japan, using geometrical forms and precious metals. (Lind, p.215) Whereas, Graves' tea kettle, sugar bowl, creamer, and pepper mill and press coffee maker are a representation of his humor, because of the use of red and blue icons to suggest hot and cold temperature. This thought process was also used in the creation of the "Big Dripper," where the red stand is used to suggest heat and the wavy lines to suggest liquid. (Collins and Papadakis, pp.129&153) Frank Lloyd Wright's dinnerware line was composed for the Imperial Hotel as well. The gold and white pattern was produced for a more formal dinning setting and the multicolored geometric pattern for a more informal setting for the cabaret room. (Lind, p.215) The place settings designed by Graves, which are Corinth and Delos are Greek names that show his influence of the Classical elements. Delos is the star covered pattern and Corninith the red and green fleur-de-lis pattern. (Collins and Papadakis, p.126) The wall paper, fabric and, carpeting lighting fixtures of Frank Lloyd Wright are also illustrations of his architectural expression. Wrights wallpaper contains banding around the circles and the rectangles, a graduation and repetition of circles and he used a fret pattern which is the pattern that consists of small straight bars. The fabric patterns designed by Wright incorporate various sizes of squares and triangles to illustrate texture and pattern. (Lind, pp.208-209) Wrights lighting fixtures contained vertical slats which create rhythm between the spaces, the opaque class contrast with the negative space being that it is a rectangle as well. (Heinz, p.157) This wall lighting fixture from Wright contains strong banding which pull out the varying sizes of rectangles. (Lind, p.210) The glass motifs of Wright are actually the window panels used in several of the residential designs. His use of colors and geometric style allow the panels to be used architecturally in buildings, as a wall display, or as a suspended ceiling ornament. (Lind, p.213) The carpet patterns of Michael Graves were greatly influenced by the Frank Lloyd Wright with the repletion of vertical motifs but incorporated floral patterns. The abstract carpet pattern of Graves contain irregular and unidentifiable shapes such as the dash dot patterns, s-curve shapes and , the use of diagonal lines. (Collins and Papadakis, pp.154-155) The lighting patterns created by Graves express his love for Cubism and The Art Deco style as well. The use of keystone shapes, banding and negative space and sphere, expressed the Cubism influence which was the most influential movement in modern art during the early 1900's, because it introduced new approaches in using forms and shapes. (Duncan, p.11-19) The Art Deco Style became popular in during the 1920's that was mainly used in items that could be mass produced such as jewelry, pottery, textiles and furniture. (Museum of Modern Art, pp.11&12) The Art Deco Style is characterized with geometric shapes, smooth lines, and streamlined forms. In the production of jewelry for Cleo Munari, the question was asked "What ancient jewelry do you most prefer?" Graves answered Etruscan and Roman. Graves [illegible] produced "non archaeological" jewelry that is not very elaborate and ar [illegible] entified with different art styles. (Collins and Papakadis, p.128)

FURNITURE

For many architects being a total designer has allowed them to create with the entire site in mind. However, with the invention of machine technology and pre/post war industrialization, forced the architects to realize the importance of not only catering to those of the upper class but to the average consumer as well. The architects, Frank Lloyd Wright and Michael Graves, both were impressed with machinery and the ability of mass production in furniture. Both Wright and Graves used Abstract and Cubistic designs in there production of furniture. (Emery, pp.5-10)

Frank Lloyd Wright's furniture was known as both traditional and modern. The materials for his furniture consisted of various woods such as mahogany, ebony, and oak, plus other materials such as leather upholstery, fabric and steel. Wright's furniture is very recognizable because of his repeated use of high verticals and cantilevered slats. Chairs from the Robie House, the Dana-Thomas House, and the Prairie House all display Wrights unique style. (Lind, p.196) The Reader's Table also shows a series of long vertical forms with narrow spaces and lights to assist in reading. He is well know for his dining tables and chairs, but also for his armchairs, sofas, office and bedroom furniture. The armchairs and sofas were all made from various types of woods, leathers and or fabrics, they still display his use of bold horizontal and vertical slats. The office furniture is very a very identifiable piece of work from Wright's. The secretarial desk and its matching chairs are made up of metal which depict a feeling of new tech and a moving forward. The top of the desk have a resemblance of small buildings and the bottom drawers resemble the top portion of the Guggenheim Museum. (Heinz, pp.186&187)

Michael Graves, a Post Modern furniture designer has redefined the classical and modern style though his creations. The architectural experience and the use of color were not just for decoration but copies the Roman Classical style using warm tans, earth reds and violets. Many of the creations from Graves used various woods such as oak and ebony but Graves also utilized various leathers, fabrics and upholstery. The Conference Table designed by Graves for the showroom of Sunar, was made form blond wood and contained fluted pilaster legs with thin patterns. The chairs have large areas of blond wood with ebony sections and wedge shaped legs. The Circular table for the Sunar Showroom in London has square and ebony wood base, with circular designs on the top, illustrate his use of geometry in his forms.(Collins and Papadakis, p.146) The Upholstered Lounge Chair, in very identifiable of Graves because of the coral color. The chair is very organic because of the curves and the ionic column back of the chair.(Collins and Papadakis, p.148 The Plaza Dressing Table again contains spheres, rectangles and triangles all geometric form which make this a very geometric piece. The spheres support the triangle which is supported by rectangles which are repeated through out the entire dressing table and ties it all in with the circular stool. The Stanhope Bed contains negative space at the head board and the repeating of vertical lines through out the bed. The bed also contains wedge shapes and again the use of small spheres to make this a definite Graves piece. (Collins and Papadakis, p.149)

CONCLUSION

Frank Lloyd Wright and Michael Graves are the most prominent and visible designers of their time. Although they have faced numerous criticisms from there willing to try anything methods and carefree attitudes, have allowed success throughout their lifetime. Their architectural structures and various pieces designed have proven their skill and craftsmanship. Items ranging from dinnerware to carpet designs have place these designers in a category all of their own. Frank Lloyd Wright and Michael Graves are truly men who design with the consumer in mind.

ART EDUCATION
ART IS UNDERRATED AS AN INSTRUMENT FOR TEACHING ESSENTIAL LEARNING AND COGNITION SKILLS

Frequently articles appear in the newspaper concerning the need for educational reform and the "21st Century Classroom. It is true that our society is becoming fast-paced and information-driven. In businesses and schools across our country, computers are becoming as necessary as the telephone. While there are advantages to new technologies, we are possibly over looking the disadvantages. In this rapid growth we are losing a personal aspect, namely the ability to acknowledge and interact with other human beings. A tool to aide school reform already exists within the schools. A closer look at the underrated art room can reveal possible answers.

What learning skills can art provide? Desire, innovation, and problem solving skills are among the first of possible answers. Most curriculum can be related to art and enhanced through an art project. Art has the potential to make a significant difference in the knowledge gained and retained by the students. This can be accomplished in our school system without years of studies and huge budget changes. This paper will examine possible methods in which art can be applied to school curriculum. This application of art can provide students with opportunities in individual and group projects, thereby, enhancing individual problem solving as well as group cooperation.

BACKGROUND

From the book *Foundations of Education*, by Ornstein and Levine, a chart can be found summarizing the educational theories of eleven pioneers in education, dating as far back as the sixteenth century. Suggestions for modern day educational reform still mirror these revolutionary theories. Many of these pioneers included in their recommendations for curricula, the use of high activity levels in learning. As noted, Comenius felt that education should relate to "children's natural growth and development."[1] Froebel's educational theories have been used in Great Britain since 1854 in kindergartens. Froebel's applications, or methods of instruction, were based on the premise that self-activity, play, and imitation would facilitate children's growth and learning. He felt that children were eager to be active learners. Piaget's educational theory extends that of Comenius by suggesting that education should be organized to the growth and development patterns of children. Children need to see objects, to touch and feel them, and to be able to manipulate objects in order for learning to take place. As a means for intellectual development, the children should be encouraged to verbalize their finding, discoveries, what they have learned from each lesson. In early childhood children lack the ability to think abstractly. Children need a concrete form of learning, until adolescence when the ability to think abstractly develops. However, as abstract thought develops, the need is not eliminated for children to test their ideas in concrete media. Art can provide the concrete key to learning in many subject areas.

TEXT

The concern for effective education extends from the beginning of organized education to current. The need for reform or restructure with the educational system is a common topic across America. In the broadcast, *School That Work*, hosted by Rodger Mudd, several schools

BEST COPY AVAILABLE

were highlighted that explored and instituted pioneering solutions in restructuring their school programs. In each school the primary goal was to assure all of their children achieved academically. Solutions incorporated collaborative learning environments. There is a closeness existing between the teachers and students that is not commonly found in other schools. Teachers looked to each other for new ideas as well as for problem solving. In each school, the Principals felt free to enter classrooms and participate in instruction. These Principals were not seen in strictly an authority role, and it was evident that the children felt comfortable with the interaction from all school staff members. Each of the schools had unique and effective applications in interactive education and creative lesson techniques. They proved among other points, that curricula can be effectively interrelated.

One of the elementary schools highlighted proved that money is not a key to educational success. Their success stems from the school's acting independently from the school district, the strong camaraderie among its teachers, and their stronger dedication to the children's success. The teachers do not teach in isolation, and display support for one another's projects. Teachers readily enter each others classroom as they implement interrelated lessons.

Examples of collaborative lessons were numerous and extend from the kindergarten and up. Twice the fourth graders and kindergartners worked on an assignment together in pairs. One upper grade encompassed many subjects through one project. The students worked in pairs on a geography assignment. English class involved the students developing a report on their geography assignment. Through the research required to complete the assignment, the students were exposed to Library Sciences. Art provided the visual aspect as the student created mop-up map illustrations of their geography assignment. All of these classes focused the student's attention into one single lesson. This exemplifies how curricula can be related, if collaboration between teachers and lesson plans is an element in lesson planning.

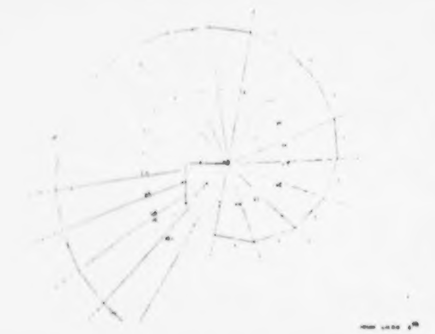
Numerous articles or abstracts are available through Infotrac that demonstrate successful use of art in classes and successful integration of art with other curricula. One article explains the approach used by Philadelphia, PA's Lea School, known as *Creative Connection*. Their approach unifies or consolidates art, math, technology, and architecture. The project links school to the community and challenges students to explore themselves as well as their community. Mathematics are involved into each activity to "strengthen the link between imagination, design, and real world visibility. The goal is to develop higher order thinking skills and broaden our students' views beyond the classroom and their neighborhood, into their entire world."[2]

In her research article, Who Ever Said Studying Art Would Be Easy?, Judith Smith Koroscik writes, "Increasingly, our teachers are being asked to link art to other parts of the K - 12 curricula, often between art and social studies or between the visual arts and other art forms, such as dance or theater."[3] Arthur Applebee notes in his book, "the curriculum is a vehicle that shapes the kinds of knowledge-in-action that students develop."[4] Education should be more than the act of inputting information into students. Education should include the opportunity to apply learned information.

Alan Block and Sheri Klein look to answer the question "How can we devise the educational experience as a journey without dictating its pathways and boundaries?"[5] Their article describes their experiment in the use of postcards to mirror a travel in education. Most of us when taking a trip either take pictures or buy postcards to remember our travels, "They are a symbol of movement."[6] The students produced postcards to also represent an experience and movement. More importantly, the student-produced postcards are in fact - Art, that is Mail Art. Block and Stein note "If we understand the walk as the metaphor for curriculum, then the postcards are curricular tools for connecting with the learner along his or her journey."[7] Mary Ann Stankiewicz explains in her editorial that "Metaphor is considered to be an essential process and product of thought."[8] She continues with a quote from Richard Schiff as describing metaphor as a bridge between art and life linked to the contextual approaches to art. Through classroom observation in different schools, I am seeing teachers incorporate an art project to convey understanding of a lesson to students. Art is more than drawing and coloring, it is a connector to enhance student's learning. At my local junior high school, Mr. Greene recently interrelated many techniques in his lesson on Japan. He taught the student's the art of Origami, prepared several Japanese dishes of typical foods along with teaching about geography, language, customs, and religion. One of his students commented that his class is interesting no matter what he teaches about. The students feel they learn much more since

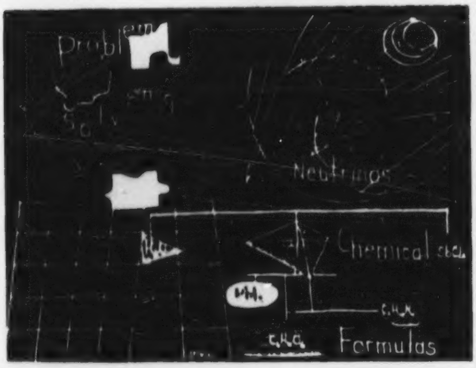
BEST COPY AVAILABLE

they do not go strictly by the book. The example to the left, was a clever way in which the high school geometry teacher persuaded students to calculate the square root of numbers. Each square root calculation directly relates to the length of its line. The result is a unique art form that has introduced geometry, given students experience using a calculator, and built confidence for doing math computations.



I feel these teachers have to a limited extent, correlated art to coursework and allowed the students the opportunity to apply learned information.

The example below is how a chemistry teacher begins coursework. The students were to research and develop an art project in their choice of media that related to chemistry. This example demonstrates a few aspects that would be covered during the semester.



The cover of Art Education displayed the concept of using a recognized work of art and reinventing or redefining it. This is an excellent example of how art can begin interrelated curricula. The cover illustrates the Mona Lisa, painted by Leonardo da Vinci and a student's representation of the Mona Lisa. Interrelated curricula could include geography lessons of Italy, history through events in Italy's history or events in the life of da Vinci. English could relate through the development of an essay to relate with other research or through the study of literary works for that time period. Science and math classes could explore any of the various invention and theories of Leonardo da Vinci. The possibilities of this one topic are far reaching, as the suggestions above are just a sampling.

The book *Schooling in the Light of Popular Culture*, identifies the most frequently reported problems, causes, solutions, and praises that appeared in the Times during the 1950's and 1980's. Note should be taken that many of the listed problems and causes are also the solution. In five of six categories, curriculum is listed. Consideration should be given to curricula changes from successfully restructured schools, such as those in the program *Schools that Work*. It is very possible that adding art to interrelated curricula may have a greater effect in overall education as much or more than changes in the content.

In, conclusion, we should consider the statement made by Larry Martz in his book, *Making Schools Better*, "Education is done with children, not to them. Learning is an active process of questioning, exploring, and understanding, a child is not a receptacle to be filled up with lectures and memorized facts."[9] In our search for improvement in the educational system, educators should consider an interrelated curricula that includes art. Educators working together through interrelated curricula gain expanded problem solving and creative thinking skills. At the same time, educators as role models, are setting important examples to students. Namely, examples of ability to acknowledge and interact with other human beings, of being part of the solution, and of successfully working as part of a group. Most art projects can involve interaction of working in a group, creative thinking, and problem-solving. And according to the junior high school students, keep class fun. The end result for those students, they have increased their knowledge and applied the knowledge to action while enjoying themselves.

Toontown: The Disney Tradition Continues

Jennifer Lugg

Department of Art and Art History
University of California, Davis
Davis, CA 95616

Faculty Advisor:
Dr. Dianne S. Macleod

Toontown is the newest "land" at Disneyland and perpetuates many of the phenomena for which the theme park has been well known and even criticized in the past. This analysis shows that Toontown is a physical microcosm of Disneyland, beginning with the entryway which leads one under a train station to emerge in a different world on the other side. Here, Baudrillard's concept of simulacra is taken to the extreme, as "real" and "fake" become entangled in a three dimensional simulation of a two dimensional (cartoon) representation of the world. The result is a landscape more perfect for visual consumption than even that of Disneyland proper. Compulsive heterosexuality is set up as the norm in a highly gendered system so blatantly stereotypical one wonders how it passed from the planning stage to completion

Toontown is the newest land at Disneyland in over twenty years. Inspired by the movie "Who Framed Roger Rabbit?" it is billed as "the land that Toons built" just for kids. It is a cartoon world come to life, the place where all the cartoon characters at Disneyland are supposed to live. Like the finale in "Who Framed Roger Rabbit" the Toons have broken their corporate bonds and mixed together, representing the merger of Disney and Warner Brothers.

Toontown is a physical microcosm of Disneyland itself. Just as one enters Disneyland, in Toontown, one also "[passes] through a gate suspending normal temporal and spatial arrangements" (Mills 1990, 70). From this gate, the pathway leads under a train station to emerge into a different world on the other side. In both Disneyland and Toontown this functions as a form of ritualistic rebirth (Stilgoe 1983, 218). While in both cases this passage under the train station leads back to the good old days, to childhood, and to adventure, the Toontown entrance does not lead to optimism and the promise of progress. Disney parks have always have problems with the concept of progress and tomorrow, for the projections do not come true. At EuroDisney, Tommorowland was replaced with Adventureland, a land of nostalgia for the "Wild West." In Toontown, the aspiration to progress is replaced by the aspiration to regression. It really is the place in which one can become a blathering child again. Toontown is built on a modified hub design, and the Jolly Trolley runs on tracks through the busiest section, just as a trolley runs down the busiest parts Main Street, U.S.A.

In many ways Toontown outdoes the rest of Disneyland at its own game, amplifying phenomena for which Disney has become infamous. Two of the most famous subjects of critique of Disneyland proper exemplified in Toontown are simulacra and gender.

Jean Baudrillard (1983) considers Disneyland to be the ultimate example of simulacra, a copy of an original which does not exist. Simulacra, says Baudrillard, is like a map which precedes the territory. Simulacra becomes more real than the real thing it simulates. In so doing, simulacra obliterates its referent, leaving itself as a copy without an original. In this way, Main Street U.S.A. becomes more real to us than Kansas Street, the main drag in Marceline Missouri on which it was based, ever was. When we become nostalgic for turn of the century life, we think of the sparkling Main Street at Disneyland rather than the dirty, muddy and theft ridden main street of Walt Disney's childhood or any of the other thousands like it (Marling 1991, 194). The simulacra at Disneyland confuses our understanding of reality. As Umberto Eco (1986, 44) writes:

> When, in the space of twenty-four hours, you go (as I deliberately did) from the fake . . . wild river of Adventureland to a real trip on the Mississippi, where the captain of the paddle-wheel steamer says it is possible to see alligators on the banks of the river,

> and then you don't see any, you risk feeling homesick for Disneyland, where wild animals don't have to be coaxed. Disneyland tells us that technology can give us more reality than nature can.

Baudrillard's concept of simulacra is not subtle enough to describe the actual phenomenon of real and fake at Disneyland. Stephen Fjellman (1992, 255-56) defines four categories of real and fake: the real real, real fake, the fake fake, and the fake real. The real real at Disneyland are elements of nature to be controlled: hunger, thirst, lines. The real fakes are turn of the century facades on Main Street, or the moving spaceship cabin in the Star Tours ride, or a cartoon Mouse named Mickey in his debut short "Steamboat Willie". The fake fake are human beings in Disney character costume. As children can attest, the fake fake is more real than the real fake. "Look its *really* Mickey!" Even otherwise sane adults do the same thing. A friend of the author who had never been to Disneyland before saw Mickey Mouse, spontaneously yelled *"Mickey!"* ran up to him and hugged him. To this day she doesn't know what overcame her. Even Fjellman's concept of the fake fake is not subtle enough to cover the permutations of reality in this exchange overheard at Disneyland:

> Child: I saw Mickey . . . 'n Goofy . . . 'n Dumbo . . .'n the Little Pigs . . .
> and . . . and . . .
> Adult (helpfully): Didn't you see Snow White?
> Child: Oh, yes. I saw *her* . . . but she wasn't real.

As Anthony Haden-Guest (1973, 270) quips, "A mouse with a fiberglass head was real. A girl with a wig was not." The fake fake, it seems, has an internal hierarchy all it's own.

The fake real, what Baudrillard called simulacra—a copy without an original, is achieved by transformation of the real fake through continuous bombardment which results in a blurring of boundaries. In this way the turn of the century facades (real fakes) on Main Street become the phenomenon and mythos of Main Street U.S.A. (fake real) itself.

Toontown is simulacra taken to the extreme. It is, after all, a life size cartoon. "Where," an advertisement in the *Los Angeles Times*, February 7 1993, tells us, "a Toon can be a Toon. And you can too!" A place where "real" and "fake" become entangled in a three dimensional life sized simulation of a two dimensional drawn caricature representation of the world. Even Richard Fjellman's distinctions of the real and the fake cannot capture the subtitles of the gyrations of reality here. It is no accident that the author's friend who went crazy over Mickey Mouse did so in Toontown. Or, that the rest of the night she kept repeating excitedly, "I met Mickey! I *really* met Mickey!" In Toontown it is *not* the real fake which turns into the fake real, the simulacra which is more real than it's referent. Here, it is the fake fake which becomes the fake real—the simulacra—more real than the tawdry, boring lives and homes lacking wonder to which the visitors must return at the end of the day. One can always aspire to the lifestyle presented in Tommorowland, even if it will not come to pass. But one cannot aspire to owning dishes which swim around inside a dishwasher. Just as a fiberglass headed character seems more real than a girl in a wig, so too the Toontown dishwasher seems more real and exciting than the one presented in Tomorrowland's Carousel of Progress, or the ones in our homes.

Fish swim around in the gas pumps at Goofy's Gas. The fact that it seems *so real*, realer than real, can suddenly crash into that sinking feeling that absolutely nothing at all is real. This phenomenon, labeled "creeping surrealism" by Joel Achenbach (1987, 18), exemplifies Baudrillard's idea that as simulacra is more real than what it copies, it renders nothing real. After all, what can one do with a plate full of hologram chocolate chip cookies?

One thing we *can* do with hologram cookies (which are found in Minnie Mouse's kitchen) is consume them visually. Just as the cookies pull the viewer in to be visually captivated, so does Toontown itself. It is a landscape even more perfect for visual consumption than that of Disneyland proper. It is candy for the eye. Not only in the figurative sense, but literally too. One feels as if one could run over to a hill or tree and start licking. The construction is reminiscent of the latest trend in new housing developments where houses appear artificial: oversized for their lots, with wasted space, out of proportion windows, and stucco which has been too perfectly applied and painted neutral pastel or sickly blues and greens. But here in Toontown it works, for here, *artificial appears more real than real ever could.* The buildings' proportions are all off, the colors pop, and the shapes jump out at the viewer. Toontown draws the viewer in, and the viewer devours Toontown.

The most troubled and troublesome area in Toontown is that of gender. Toontown was built on a highly gendered system so stereotypical, one wonders how, in the 1990's, it passed from the planning stage to completion. The legacy of gender trouble at Disneyland goes back before Disneyland to Walt Disney's animation days. The women he employed were "ink and paint girls," not animators, who had to work in a separate building and were paid the lowest wages at the studio (Holly and Denning 1993, 93). The fictional women Disney animated, such as Sleeping Beauty, Snow White, and Cinderella, are bland passive heroines. In a scathing criticism of Walt Disney, Kay Stone (1975, 44-45) writes: the Disney heroes "succeed because they act, not because they are," while the heroines are "cute little beings existing among pretty animals and singing flowers." The villains of these films, such as wicked stepmothers and Cruella DeVille are also female. Walt Disney's animations offered women only the dichotomy of nice passive girl versus wicked witch. At Disneyland the gender troubles continued. These troubles are best exemplified in the ride Pirates of the Caribbean, where a "group of pirates loots a town and rapes its women, who enjoy the process because, it is explained, they're all old maids" (Schickel, 1968, 336).

The symbols of male and female in Toontown are Roger and Jessica Rabbit of "Who Framed Roger Rabbit." They grace each bathroom entrance, and we must identify with one of the two in order to know which bathroom to use. Roger is the presented as the norm: a regular, decent guy. Jessica is the (highly) sexualized Other. Their relationship is a realization of the stereotype of the nerd teenage boy's ultimate fantasy. Roger is a gangly, plain looking guy—well rabbit—who managed to win the oversexualized object of his desire. Why is his object of desire so much the exoticized Other—a sultry over idealization of a human female? Judith Butler (1990, 22-23) maintains that when gender is regulated as "a binary relation in which the masculine term is differentiated from a feminine term and this differentiation is accomplished through the practices of heterosexual desire" the system is an "institution of a compulsory and naturalized heterosexuality."

In the forms of Roger and Jessica Rabbit, Toontown has tapped into what Jane Kuenz (1993, 78) calls Disneyland's chief fetish: compulsive and unchanging heterosexuality in the service of reproduction. These paradigms of male and female are based not simply in gender roles, but in heterosexual gender roles, played up to the nth degree. When the author walked up to a bathroom in Toontown she had, for the first time in her life, the alienating sensation "this bathroom is not for me." The role she was supposed to identify with was so extreme that she could not identify with it. This is a concern, not because the author's identity as a woman is threatened, but because Toontown is advertised as a land for children. What kind of influence will this have on young girls and boys?

Mickey and Minnie Mouse do not seem to function together on the level of desire described by Butler. In fact, they don't seem to function on any level of desire at all (or, as will become apparent, even on any level of friendship). Nevertheless, their relationship is based on gender as "'a ritual social drama' that produces heterosexuality as a prediscursive or natural category" (Kuenz, 1993, 79). The only thing which seems to hold their relationship together is stereotypical gender roles.

Minnie is passive, her life is centered on the home and on Mickey. According to the phone messages and notes in her house, Mickey is her only friend. She puts his wishes and needs as number one on her list of things to do, and is constantly assisting him, such as making his breakfast, lunch and dinner, and giving him presents. At the back of Minnie's house is the Wishing Well. It is the only apparent indicator of active agency in Minnie's life. However, it is only a false indicator, as wishing is only the unfulfilled, passive version of doing or creating.

Mickey is active. He has many friends and is totally dedicated to his work at his movie studio, the Movie Barn. His lives his life in the world, as shown by the tiles of some of his movies: "Mickey's Winning Team," "Mickey's Service Station," "Mickey's Mellerdrama." Notes and messages from Goofy, Donald and Roger Rabbit, all of which pertain to their work together, grace his bulletin board and answering machine. Mickey even has Pluto, his trusty dog. Minnie does not rate high on Mickey's list. Calling her ranks sixth, even after watering his lawn. In the message he leaves on Minnie's Phone, Mickey says "I'll be late for our date. I have to meet someone at the Movie Barn, you know how it is. Gee, thanks for understanding, bye." Minnie comes second to Mickey's outside world with regularity. Both parties seem oblivious to Mickey's lack of appreciation and respect for Minnie.

Mickey and Minnie's houses, which stand next to each other, exemplify the trappings of their respective highly defined genders. Minnie's house is quaint: it is pink and lavender, has wood shingles, flower boxes, heart shaped windows and a heart shaped weathervane. Mickey's house is solidly "masculine" with wood siding, a brick roof, and no ornamentation.

Inside Minnie's house there are three rooms: a sitting room, make-up room, and kitchen. The furniture in the sitting and make-up rooms is all cartoonishly oversized and angular, and mostly pastel. The kitchen is white and closer to normal life-size. The sitting room couch and chair are upholstered in a leafy green print. Sitting in the magazine rack is *Cosmousepolitan*, and lying over the arm of the chair is *Jessica's Secret*, a takeoff on the *Victoria's Secret* lingerie catalog. Minnie's list of things to do reads:

1. Call Mickey
2. Mousercise
3. Make box lunch for Mickey
4. Cook a nutritious breakfast for Mickey
5. …the garden
6. …for Mickey
7. …center

The make-up room has a large dressing table with enormous cosmetics and bottles of perfume sitting on top. There is a chaise lounge, a wardrobe, and a few books. In the kitchen the focus is on cheese. The shopping list on the refrigerator not only lists myriad cheeses, but cheese puffs, cheese crackers, cheese cake, cheese pizza, etc. Also on the refrigerator is a recipe for "Mickey's Favorite Cheddar Cheese Chip Cookies."

Mickey's house is paneled in dark wood and has a solid feel. There are six rooms to Minnie's three rooms, representing Mickey's more full life. There is an entrance followed by a front room, with the requisite ship in a bottle and model car on the table, and an abstract print couch and fireplace. The phone nook holds books and messages. Mickey's to do list reads:

1. Wake up at 5 A.M.
2. Mousercise
3. Play with Pluto
4. Eat a balanced breakfast
5. Water Lawn
6. Call Minnie
7. Be in Movie Barn by 6:30 A.M.
8. Open Barn to greet guests

The trophy / music room includes the compulsory sports trophies and stuffed fish. A piano and globe round out Mickey's creative and intellectual sides. In the smoking room is a second fireplace, books, television, dart board, more trophies, and Pluto's bed and bowl. Mickey also has a laundry room. This is the one non-stereotypical room in Mickey's house, proving he is at least somewhat more rounded than Minnie. But he doesn't actually wash his own laundry, as the note for the housekeeper attests. Next is the greenhouse, and then the backyard, which leads to Mickey's Movie Barn.

From Mickey's house we learn he is a well rounded gentleman. His life is dedicated to his friends and work at the Movie Barn. Minnie's house shows that her life revolves around Mickey. He is her only friend, and the first priority in her life. Minnie is a stereotypical Stepford Mouse. She only exists to support her boyfriend, whether he treats her well or not; clothing and makeup are of utmost importance; and she cooks. She also knows her role in sex, as evidenced by her *Jessica's Secret* catalog. Mickey conversely has barely any time to spend with Minnie; he takes her for granted and takes advantage of her. He too is a stereotype—a man of agency out in the world who makes no attempt at equality with his partner. Mickey does not seem to be friends with Minnie. Likewise, Minnie does not seem to be friends with Mickey. There is no exchange on the level of friendship. They both appear to simply be following roles they have been ordered to play. There is absolutely no reason for them to be together except for the gender / sex roles which make a heterosexual relationship a necessary requirement.

The blatantly biased depictions of gender in Toontown as evidenced in both Jessica and Roger Rabbit, and Mickey and Minnie Mouse are highly disturbing in an environment supposedly built for children who, by their very nature, are still working out their own gender roles.

This analysis of Toontown has shown Toontown to be a physical microcosm of Disneyland proper, a land which displays characteristics for which Disneyland has been infamously criticized in the past. Toontown, the ultimate example of Disney simulacra, encourages visual consumption which borders on the imperative to literally consume one's surroundings. Toontown's gender roles are based on compulsive heterosexuality, leaving little room for friendship or mutual exchange.

Political Ideologies of Harlaxton Gardens, Harlaxton, Lincolnshire, England

Dr. Shirley Schwarz

As we approach the end of the twentieth century, the English countryside is still dominated by the large mansions and parks that belonged to the aristocratic landed gentry of the annals of British history. The land serves as a vehicle of ideas, of personal and political commitment which has been cultivated by a society very conscious of history in the midst of the dynamic changes of the nineteenth century. In response to industrialization, urbanization, and the rising middle class, rural landowners turned to the past in search of security. Large 'Jacobethan' style mansions invoking the reign of James I were constructed in the midst of vast and consciously altered landscapes across the English countryside. These mansions and gardens embody traditional political and land-inspired English values of wealthy, moral, and well-educated men. Harlaxton manor in the English Midlands at Lincolnshire, although not as famous as Belvoir Castle, has never been studied. My intent in this paper is to demonstrate that its owner, Gregory Gregory, had a political and ideological motivation for his creation of the vast and theatrical panorama that Harlaxton manor displays.

Gregory's position as prominent country squire in the nineteenth century and as the owner of Harlaxton can be attributed to his noble lineage. The Harlaxton property first came into the hands of Flemish immigrants, the de Lignes, in 1619. In 1620, Daniel de Ligne, was knighted by James I and ten years later was named high sheriff of Lincolnshire county. Gregory's family, from Nottingham, married into the de Ligne family in 1738. Through a succession of inheritances, Gregory acquired the Harlaxton estate in 1822 in addition to properties in nearby Nottingham and Denton. Thus, it appears Gregory quickly acquainted himself with the role of a landed gentry.

With his new societal position, Gregory sought out a hillside on the Harlaxton property ideal for the creation of his grandiose scheme for a manor. Gregory searched for an ample area where he could display his wealth of books, fine art, and statuary accumulated on the Grand Tour. He envisioned the construction of a traditionally influenced manor on a hillside with dramatic terraces and landscape trailing down from it that would display Gregory's social and political status. This new estate would be comparable to the precedents set by the landed gentry who Gregory would have known at neighboring Belvoir Castle and Hatfield House. The grandeur of these estates conveyed a message of an owner who welcomed royalty into his domain. "The temple of honor must be built on an eminence rather like a spurious church in a landscape park."[1] In summary, Gregory's estate would embody all of the supposed moral qualities and political ambitions associated with an old English secular 'faith', a belief in unswerving British tradition.

In 1831, Gregory razed the old de Ligne homestead, Hungerton Hall, and briefly employed Anthony Salvin, a well-known designer and architect, until 1838. At this time he then hired another prominent designer, William Burn, who remained at Harlaxton until its completion in 1855. These two designers, Salvin and Burn, would combine Gregory's romantic and youthful energy with his landed and powerful display of tradition. To do this, they chose to fashion the manor in an overall 'Jacobethan' style.

BEST COPY AVAILABLE

The 'Jacobethan' style is characterized by dramatic skylines and undulating facades reminiscent of Baroque dynamism. The 'Jacobethan' is actually a revival combination of the seventeenth century English Jacobean and Elizabethan styles. So named for the king and queen of England, respectively, these styles symbolized strong and independent periods in English history and nationalism.

This period, the beginning of the nineteenth century was insecure in its sense of tradition, history, and nationalism. When the popular Queen Victoria succeeded the throne in the midst of dynamic and changing times, it is understandable that such times inspired the revival of Jacobean and Elizabethan conservatism.

Thus, this combined 'Jacobethan' style became acceptable as the national style and it was often employed in the rebuilding of country houses of revivalist Tory landowners of the 'Young England' faction.[2] The 'Young England' faction represented an early nineteenth century collaboration of young, energized Tory politicians responding to industrialization, urbanization, and a new middle class.

Due to Gregory's prominent social status, he was very cognizant of these contemporary political activities, if not directly involved in them himself. Under the influence of 'Young England', Gregory was offered an escape from the disagreeable present to an agreeable, but imaginary, reconstruction of the past, in which lords of the manor would once again dispense the paternal justice of a feudal society.[3]

In the fashion of Elizabethan fondness for high ground, as Gregory saw displayed by the placement of the nearby Duke of Rutland's property, Belvoir Castle and the Avon eminence, Stoke Park, Gregory chose to build Harlaxton on a hill. Wishing to model his mansion after Belvoir, Gregory was also attracted to its arrangement of gardens and grounds. The harmonious transition from house and gardens to terraces to natural woodlands and fields surrounding Belvoir paralleled Gregory's proposals at Harlaxton.

Gregory sought to articulate a 'picturesque' display of a mansion on a hill closely surrounded by formal flower gardens which united with the natural countryside at Harlaxton. The concept of the 'picturesque'[4] in landscape design originated with Humphrey Repton, a well-known contemporary garden designer who is famous for his numerous landscape 'improvements'. Repton could take a sketch of the existing property and visualize the required improvements to create a picturesque environment. Repton's 'picturesque' style was captured by the Quarterly Review, "(Repton) extracted real English style gardening to be typified by mature parks, dignified mansions, and gentlemen benevolently overlooking flourishing landscapes."[5]

While Repton never had direct contact with Harlaxton, the new and younger landscape gardener, J. C. Loudon, visited the site years after its completion to find some of his own practice put into use. Loudon's theories focused primarily on what were thought as the liberal qualities of nature. The liberal view also implied a political position which Loudon sought to manifest in his landscape creations, fostering the term 'gardenesque'. This 'gardenesque' liberality pronounced itself most strongly with the vast array of vegetation used throughout the gardens as well as the manner in which this vegetation was planted. "Its (the 'gardenesque') principle function was to display the skill of the gardener, particularly where the gardener was also the owner."[6]

The theories of Repton and Loudon, the 'picturesque' and the 'gardenesque', respectively, were not far from each other in basic principles. The former tended to be founded in the more conservative designs reminiscent of his predecessors. The latter, on the other hand, greeted a new society with innovative designs. Loudon and the new society incorporated theories and practice of Repton's 'picturesque' methods and elaborated to extremes. This resulted in a more articulate formation of geometric and formal gardens immediately surrounding the house of the estate. Loudon's 'gardenesque' also developed 'picturesque' landscapes into more densely and irregularly planted parks.[7] Two or more trees were planted in a single hole to create a dense and irregular outline. Clumps of land and vegetation scattered freely across the landscape surrounded the owner with a sense of variety and luxuriance.

Carefully considering the placement of plants ease the harmonious flow of the overall contrast, from the natural to the unnatural. A mix of evergreen cedars, yew, holly, and holm oak trees are planted in 'gardenesque' fashion around terraces and unite areas of formal atmosphere with the encompassing woodland and countryside. This mixture of trees provides a variety of height, texture, and color. Common laurel, Portugal laurel, Irish yew, and holly frame selected garden walks and cascade down terraces exaggerating the topography. The sensation of such deliberate creations enhances the theatrical and dramatic illusions.

In our exploring this particular use of vegetation and dramatic display, standing at the front entrance gates, one sees a mile ahead the magnificent 'Jacobethan' manor. this view is embraced by the woodland which rises behind and to the side of the house. From this imposing introduction, one explores the great expanse of the countryside. Drawing from indenture contracts, it is likely that the cultivated fields which now stretch across the expansive grounds also lined the same drive that Gregory traveled in the nineteenth century.

The descent down the drive leads one into a 'picturesque' interplay of water and woodland. Midway along the mile-long entry, the smooth continuity of the natural land encounters a small lake enclosed within irregular and serpentine edges. This irregularity reflects Repton's 'picturesque' influence and is enhanced by the encompassing thin woodland of willow and birch tees. Leafed, deciduous trees add delicacy to the lake and protect it from the disparate cultivated fields. This delicacy also contrast with the dark and brooding qualities of the conifers and Lebanese cedars which frame one's view of the manor.

Next, passing through the entrance lodge gate, the hedge row lining the approach guides one's eye along the ascent to the manor. The dense hedge serves as a natural guide as well as a natural screen to outlying property. Nearing the house, the hedge serves again to separate the cultivated fields from the more formal and majestic stages lying ahead. Clumps of deciduous trees located at the end of the hedge row deliberately screen a full view of the manor. The grand 'Jacobethan' decor and skyline of the bell tower are all that is visible at this stage on the approach.

Their dense foliage also affects the lighting of the approach. Nearing the manor, the approach appears to narrow and darken as the natural shading of the trees overhand. However, exiting from the shadow, the stage opens to a flood of natural light so that every detail and shadow of the intricate Baroque-style manor is exposed.

The moment one steps through the courtyard gates at Harlaxton one becomes a character on Gregory's stage. One is immediately struck by the unmistakable Baroque character of the architecture manifested in the manor which is also reflected in the exterior and gardens. The next three of these stages, French, Italian, and Dutch, are among the elaborate and formal gardens immediately surrounding the manor.

The grounds adjacent to the manor were conspicuously designed to delight as pleasure-gardens and embody a more personal and dramatic aura. These pleasure-grounds reflect his most articulate manipulation of the land. A more utilitarian section of the estate is to the north, thus the pleasure-grounds are situated asymmetrically, in accordance with Baroque principles.

At the inception of the formal gardens is a somewhat compact and dramatic series of terraces resembling the terraces Gregory derived from designs at Hatfield House and Belvoir Castle. Salvin had advocated such terracing. These terraces along with the French, Italian, and Dutch gardens affiliate Gregory with the 'Young England' factions residing at Hatfield and Belvoir. Overall, the terraces cascade down the hillside aesthetically blending with the more natural and untamed landscape and at the same time divide the French, Italian, and Dutch gardens.

Although today they are largely grass lawns, the grounds were once elaborate gardens dotted with classical monuments similar to those Gregory encountered on his Grand Tour, and conveyed in his words, "...an ideal means of imparting taste and knowledge...."[8] The Grand tour afforded him the opportunity to collect pillaged items allowing Gregory to return with artifacts exemplary of his cultural awareness as well as his personal tastes, acting at the same time as a mark of his social position. Classical sculpture once dispersed amidst the 'worldliness' of the formal gardens would have delighted and intellectually entertained Gregory's relatives and friends.

Little French influence is visible today. What remains is a long gravel walk in the south gardens with flowers bedded in parterre-fashion (partitioned) and this suggests the existence of a Parisian scene. A survey of the grounds from 1885[9] delineates the outlines of apparent parterre gardens on several terraces.

It is my theory that boxed beds of various plantings, depending on the season, would simulate those seen in the colorful and elaborate beds at nearby Hatfield which are certain to have influenced Gregory's design at Harlaxton. The use of colors and more specifically, color contrasts, heightened the theatrical and fantasy effects created. A landscape archaeological study currently being conducted will undoubtedly prove my theory.

On another terrace the stage is an Italian scene with remnants of a summerhouse and colonnades, which may have sheltered a vinery during Gregory's lifetime. Theatrically, the area opens to full sun, suggestive of the Mediterranean climate. The architecture and lay-out initially appears very formal and Renaissance like. However, the offset entrances and exits onto this stage, as well as the irregular placement of the summerhouse is recognized as an Italian Baroque arrangement.

Strolling further, the woodland wraps around the south side of pleasure-grounds opening to the next stage: an irregularly and naturally framed artificial Dutch canal. The very geometric quality of the canal seems to embody some of the most artificial and formal manipulations of Gregory's land. However, the naturally shaded environment soften its formality and provides seclusion from all other scenes of the estate.

Climbing to the highest terrace, one can imagine Gregory sitting here on an old stone bench next to a tree stump surveying his vast and romantic terraces. I imagine it may have been his favorite spot throughout the entire estate. Here the benevolent man could sit and overlook the stages of his land and life. The terraces gently step down into rolling fields outlining each of Gregory's political and personal ambitions. 'Picturesque' contrasts of the natural versus the architectural, the wild vis-à-vis the serene, and intimacy versus vast vistas culminated in one overall ambitious display of wealth, power, land, political ideology, and old English tradition at Harlaxton manor.

Reminders of Death and Lessons For Life:
Vanitas and *Memento Mori* Paintings of the Spanish Golden Age (1556-1700)

"I saw all the deeds that are done under the sun; and see, all is vanity and a chasing after wind." (Ecclesiastes 1:14)

This vision comes from the book of Ecclesiastes in the Old Testament of the Bible. The author's statement was a reaction to his own revelation that toil and life are impermanent. He realizes that generations of individuals such as himself come and go, and only the earth remains truly eternal. This legacy recognized the transience of human existence and is paramount in Catholic doctrine. It forms a framework of ideas concerning mortality in the nations that adhere to the message. Spain, the most Catholic of countries during its Golden Age (1556-1700), built upon this doctrinal legacy and added to it a unique commercial and ideological experience that considered human mortality as well, and depicted it in unique genres of painting called *Vanitas* and *Memento Mori*.

Spain began its ascent to world power status in the early 16th century as a result of New World exploration and commerce. Cities such as Seville in southern Spain became solitary depots for various trades with the newly "discovered" West Indies. Wealth became abundant, and official administrative systems were developed to deal with the new influx of income. Customs houses, Chambers of Commerce, and mints were instituted to take full advantage of a rising standard of living. Initially, life was bustling with excitement for the Spaniards who benefited in the rush to the New World.

The city of Seville came to epitomize the effects of rapid newfound wealth. A "supermarket to the world," Seville acquired vast riches from commercial trade. Everyone was affected by the growing desire for social status. Citizens built larger and more decorative homes to keep pace with their neighbors. They also threw huge public festivals and engaged in elaborate religious ceremonies. The Church also shared in the decadence and wealth, and commissioned many new artistic endeavors. Sevillan society in general became more influential economically because of the amount of money pouring onto its shores.

Not all effects of Spain's rapid advancement to financial prosperity were beneficial, however. Besides a luxurious lifestyle, newfound wealth also brought with it greed and corruption. The citizens became numb to the adverse effects because of an immersion in wealth without any apparent consequences. Silver was widely available and people spent it loosely in an effort to increase their social status. City life suffered with crime and exploitation as a result of the all-consuming drive to acquire great wealth and prestige. As awareness of this situation grew, more and more individuals began to issue warnings against the situation. Spain was quickly becoming a society steeped in material and spiritual corruption that could seriously affect its status as a worldwide spiritual leader and in fact, conflicted with their purported spiritual values.

This growing sense of disillusionment continued to spread throughout Spanish society well into the latter part of the 16th century. Beginning in the 1580s, economic decline was added to the list of growing concerns, and during the next thirty years, Spain gradually lost its seat as the world's greatest colonial power. In addition to destroying hard-earned advancements, economic decline escalated because of epidemics, constant warfare at home and abroad, and immigration to the New World colonies. Such a state of affairs left Spain with a shrunken population and declining opportunities at home and abroad.

Disillusionment also spread into the activities of the Church. During the early years of New World colonization, the Spanish clergy increased in numbers in order to Christianize native peoples and accomplish other missionary goals. However, as contact with the New World lessened because of the declining economic situations at home, the clergy was forced to direct its attention to domestic concerns. Once home, the displaced clergy returned to a scene of severe economic, social, and moral decline. Despite these pressing spiritual concerns, the clergy became embroiled in rivalries amongst each other, and disputes arose concerning land claims, customs, and religious ceremonies. Issues such as growing crime, prostitution, and violence did not receive the attention they deserved. Spanish society suffered because of the lack of strong spiritual leadership.

Other religious groups took a more militant approach to the moral decline of the times. Within these groups, a morbid strain developed in the interpretation of Catholic doctrine. A "cult of death" emerged which put greater stress on the role of purgatory and penance after death. In addition, a "popular mission" movement developed within the

BEST COPY AVAILABLE

Jesuit and Franciscan monastic orders. This new strain preached graphic images of hellfire and damnation to small groups situated in evangelical villages. Leaders used vivid paintings and sketches to illustrate images of judgment and punishment in an effort to reform what they saw as an immoral society.

Spain thus became a land divided. Society was torn between the repercussions of maintaining the rapidly acquired wealth of the past, and the desire to reform the societal immorality that resulted from economic decline. The imbalance took a turn for the worst in 1649 when Spain fell victim to the Black Death of Europe: the Bubonic Plague. Rats and fleas spread the disease rapidly amongst a Spanish society already suffering from economic decline and poverty. Within three months, Spain lost one third of its entire population. It was a devastating blow to a society that prided itself on being spiritually rewarded and a messianic people. Mass death was not part of being a divinely chosen nation!

The plague and its aftermath caused Spanish society to react in two very different ways. Some citizens considered themselves lucky to be alive and they searched for immediate gratification to celebrate their survival. Decadent behavior escalated within this group. In their pursuit of gains and possessions, disputes arose concerning the abandoned estates of the recently deceased. Mass death cleared the way for new groups of people to take what they could in the ruins and keep it for themselves.

Other surviving middle class citizens desired to pursue a more religious approach to living. These groups devoted themselves to leading a more pious and penitential existence. This group viewed the calamities of the plague as divine retribution for the previous years of worldliness and sin. Repentance was their goal because they believed that life was short and death was certain at the hands of an angry God. As a result of this mentality, there was an increase in the number of citizens leading an eremitic lifestyle. Meditation pertaining to Christ's own death would help to eliminate the fear surrounding the lingering situation in Spain following its own battle with the Bubonic Plague.

In addition to these responses, the plague also ushered in a new mentality concerning the nature of death itself. It became an extremely familiar and personal experience as well as a practical situation. Amid the confusion of mass death, land and possessions were left behind. Spain was in a state of constant upheaval concerning a solution to the problem. The situation forced Spanish society to seriously consider the process and preparation needed for a good Christian death.

Spain did have a vast history of organized demise to build upon which originated in the Renaissance. Practical devotional literature called Ars Moriendi, the Art of Dying, was widely read in the public sphere during this time. These works detailed divine grace and forgiveness rather than judgment and damnation at the time of death. According to the literature, this state could be achieved by deliberate preparation prior to the actual time of death in the form of questions, catechetical quizzes, and specific prayers. Alejo de Venegas states in his book *The Agony of Crossing Over at Death* (1537), "the greatest folly any man could commit…is to live in a state in which he does not want to die; and the remedy for such madness is none other than a good constant preparation for death." Spanish Catholics prepared for death their whole lives in order to do what was appropriate when the time came, but also as a guide to living a good life in the meantime.

The Black Death of 1649 called this legacy to mind. The historical art of dying took on practical considerations by placing more importance on the necessity of a prepared final will. Wills became so important during these years of mass death, that no citizen was allowed a Christian burial without one. Personal wills contained two types of clauses. First was a pious clause which dealt with the spiritual estate of the individual. Citizens were responsible for leaving some sort of bequest to the church after death. The second type of clause was a distributive clause which dealt with the material possessions of the individual. Both types of clauses were needed to have a completely good death.

The act of writing a will was also very beneficial for the person before death. It was considered a penitential act that would help an individual to accept the inevitability of death and detach from their worldly possessions by cataloguing their distribution. In addition, this act would help to increase an individual's generosity thereby benefiting them in the afterlife. Personal wills also took on a confessional quality through necessary reflection on the past and its accomplishments. These aspects were particularly important during the years of the plague, as testified by the deathbed presence of a notary.

In addition to being a documented phenomenon, death in Spain was also considered a social process. Moments before death, a priest, neighbors, or members of a local confraternity were summoned to the bedside of the dying individual to join the notary. These observers had a social and religious duty to help the victim fend off any last-minute temptations. This was a highly esteemed act of charity on the part of the observers. Prayers would be read and the priest would administer confession, final communion, and extreme unction by anointing the individual's five senses. These last rites were issued to prepare the individual for the separation of the body and soul. The priest and observers would continue to remain with the victim until they passed into the afterlife. This was of the utmost importance because of the believed presence of demons at the bedside of the dying individual. It was at the precise moment of the soul gradually moving upward toward the spiritual realm that the devil would attack the still present sense of reason at the last minute of life. It was a bitter contest between the demonic presence and the

BEST COPY AVAILABLE

reassuring power of the bystanders. The demonic presence would also try to tempt the victim with vain sentiments such as: the desire for longer life, impatience with suffering, attachment to family, riches, honors, merits, fear of hell and punishment, denial of faith, or anger and blame at God for death. The bystanders at the scene provided the remedies and encouragement needed to overcome these temptations, thereby providing a good death and the possibility of eternal salvation for the individual.

Not only did society attempt to aid an individual at death through prayer and encouragement, but also through preparatory artistic endeavors called *Vanitas* paintings. These works, often in the form of still life, contained hidden allegories which pertained to the ephemeral nature of earthly existence and human life. *Vanitas* paintings often carried a distinctly moral warning about contemplating death before being faced with the unknowable circumstances of temptation that could impede salvation.

Vanitas paintings would also provide the necessary example for the renunciation of earthly vanities needed at the last moments of life. They achieved this in three types of grouped objects. One group contained symbols of wealth and power, as well as knowledge and worldly pleasures. Objects within this group include jewelry, coins, armor, weapons, books, and instruments. Viewers were reminded that there was no protection against death which would take away the powers and possessions of earthly existence. A second group of symbols reflected the transience of human life. These objects included clocks, hourglasses, candles, and flowers which alluded to the passing of time and decay. Included in this group were skulls and bones which acted as *Memento Mori* objects by reminding the viewer of their impending human demise. *Memento Mori* objects added to the power of *Vanitas* paintings by bringing these ideas down to earth for the viewer to contemplate. A third group of symbols was concerned with references to an afterlife or resurrection. Objects within this group included corn, walnuts, glasses of wine, and other religious items.

In addition to the objects depicted, the power of *Vanitas* paintings also resided in their symbolic display and arrangement. The various objects were generally found in untidy piles amid mass disarray. The intentional negligence gave viewers a sense of worthlessness and abandon concerning the objects. By portraying the objects as meaningless and empty, the fleeting earthly pleasures they represent are depicted as trivial and subservient to eternal spiritual life. *Vanitas* paintings were intentionally mysterious in the comprehension of their arrangements in order that the viewer should be forced to contemplate the images on a more detailed basis. Good examples of these paintings include Antonio Pereda's *Vanitas* (1634), and Juan de Valdes Leal's *Allegory of Vanity* (1660). Both works contain earthly vanities and *Memento Mori* skulls, which work together to warn the viewer about attachments to worldly manifestations in the face of certain death.

Not only were *Memento Mori* objects found in Spanish *Vanitas* paintings, but also in painted images of penitential saints such as Mary Magdalen and St. Jerome who began to be depicted as a witness to the Last Judgment in the 16th century. Closer in humanity to the viewer, the image of St. Jerome was that of a humble and penitential man who meditated over skulls about the inevitability of death and the subsequent vanity of earthly objects. *Memento Mori* works of penitential saints brought reflection about death, heaven, hell, and last judgment more down to earth in order to provide Spanish Catholics with a contemplative and penitential example of behavior.

The most complete example of Spanish *Vanitas* and *Memento Mori* paintings can be found in the 17th century works of Juan de Valdes Leal. Leal was extremely interested in themes such as death, suffering, and judgment and he depicted them in his paintings. In fact, he aimed at shocking the viewer into repentance by providing a startlingly realistic arrangement of images and symbols that portrayed the inevitability of death. Many of Leal's works were commissioned by the Jesuit Order in Spain, which contributed to their dark and sinister moods. Ignatius Loyola, the founder of the Jesuit Order, advised his followers to avoid any thoughts or feelings of happiness because they obstructed the sorrow needed to better contemplate death and final judgment.

In 1672, Leal was commissioned to decorate the Church of the Hermandad de la Caridad in Seville by the leader of their Brotherhood of Charity, Miguel Manara. Manara adhered to the teachings of the Jesuit Order and based his commission on his book, *Discurso de la Verdad* (1671), which begins, "Memento homo quia pulius est, et in pulverem rebertis" (the first truth that must reign in our hearts is: dust and ashes, corruption and worms, the tomb and forgetfulness). The hieroglyphs produced by Leal were particularly fitting for this location. Their stark depiction of death reflected the work of the Brotherhood of Charity, whose main duty was burying the dead. This act of mercy was particularly important after the outbreak of the Bubonic Plague in 1649, and the subsequent famines in 1651 and 1677, which killed a significant portion of the Spanish population.

Leal produced two masterpieces for the Church of la Caridad in Seville. The first was titled *Finis Gloriae Mundi* (The End of Worldly Glory). A literal *Memento Mori* painting, Leal showed the viewer a stark and realistic account of the interior of a crypt. Skulls and bones lie in scattered piles to remind the viewer of the fragility of human life and the inevitability of death. A stigmatized hand holds a scale in perfect balance above the remains. One side reads "Nimas," "neither more," and holds animal representations of the

BEST COPY AVAILABLE

Seven Deadly Sins: pride, anger, avarice, lust, gluttony, laziness, and envy. The other side reads "Nimenos," "nor less," and contains objects of penitence and mortification: the heart-symbol of the Jesuits, a nail studded cross, scourges, a rosary, and a hairshirt.

Beneath the scales of salvation, rich in somber tonalities, three decaying figures lie in perpetual stillness. One figure is a skeleton, one a bishop in white holding his crosier, and the other a knight of the Order of the Calatrava. Each figure represents a position based upon the pursuit of earthly vanities. The figures as a whole represent the legend of the Three Living and the Three Dead (1200), in which one of the dead says to the living, "What you are, we were; what we are, you will become." This image emphasizes the premise that all of humanity is equally subject to mortality.

Leal's second hieroglyph *In Ictu Occuli* (In the Twinkling of an Eye), is a literal *Vanitas* work. The viewer sees books, weapons, crowns, a globe, and a snuffed out candle. Above the piles of vanities, a skeleton carries a scythe and a coffin and points to the title of the work while extinguishing the light of earthly existence. The work illustrates a verse from I Corinthians, "And the last enemy to be destroyed will be death, for he has put all things under his feet." For the viewer, this representation brings the Biblical down to the level of Spanish society.

The conditions in Spain during its Golden Age (1556-1700), including social attitudes, economic fluctuations, and great tragedy, were particularly conducive to the creation of *Vanitas* and *Memento Mori* paintings. They were meant to remind the Spanish people of how fragile life was, and to warn them that focusing on possessions was futile. Death was inevitable, and the only thing that one could take with them was spiritual preparation. These paintings tell the contemporary viewer about the unique experiences that altered the way that Spanish society saw this world and the next. They are also a reminder, even today, of our own temporary existence.

VISUALIZING THE HUMAN FORM: ART AND ANATOMY IN EIGHTEENTH-CENTURY ENGLAND

Erin M. Loos

Faculty Advisor:

Dr. Philip Wilson

The dualism of art and science in Eighteenth-century England was reflected in the anatomical illustrations of the time. This relationship, revolutionary for contemporary medical thought, resulted from the intellectual and aesthetic partnership formed between anatomists and artists. Although artistic and medical anatomy both convey knowledge of the inner workings of the human body, their visual motives are diverse. Medical anatomy divides the human body into its mechanical components while artistic anatomy attempts to conceptually visualize the whole based upon its parts. This research has focused on the artistic influences placed on Enlightenment period anatomical illustration. Whether the artist's brush or the anatomist's scalpel played a greater role in the study of anatomy during this time is evaluated.

As long as brushes have sculpted the graceful curve of muscles and scalpels have opened windows into the inner body, anatomy has been intertwined with art. Twentieth-century artist Burne Hogarth contended that medicine and art can enhance and refine one another when anatomy provides a connection. Medical anatomy dissects and partitions the human system into finer, more microscopic details. Artistic anatomy visualizes and fuses the whole from these parts (Hogarth, 9). During the Eighteenth century, the art of medical illustration flourished and joined artists and anatomists in a common aspiration: visualizing the human form.

In England, artists and anatomists did not cooperate in the study of anatomy before 1720. Instrumental to their developing collaboration was the establishment of a series of artistic and educational academies in England from 1711 onward. Additionally, dissections began to be performed by anatomists including William Cheselden and William Hunter with an artist's motives in mind (Bignamini and Postle, 84). The real source of inspiration for the reform of human anatomy came from the imagination of the artist (Chewning, 22). Although the surgeon was experienced in dissecting techniques, he was rarely skilled in recording minute observations. However, the artist who wanted to understand the inner body in order to depict it more accurately needed an experienced hand to expose and isolate the part or system being observed. This mutual need made artists and anatomists appropriate partners.

As can be seen in the most noteworthy of period anatomical works, the anatomist typically had developed a well-established relationship with a competent artist. William Cheselden was the first anatomist to instruct artists in England, and he believed that an anatomist must be skilled in drawing. He began teaching anatomy classes in 1711 and published an illustrated handbook for his course. This book, *The Anatomy of the Human Body*, established Cheselden as the foremost teacher of anatomy in England (Garrison, 198). His masterpiece is a skeletal atlas entitled *Osteographia*, which resulted from his collaboration with artists Gerard Vandergucht and Jacob Schijnvoet. The extent to which Cheselden contributed artistically to the atlas remains unknown. The title page of *Osteographia* shows the camera obscura, which was constructed of a mirror set at an angle to a lens, which reflected an image onto paper (Gernsheim, 16). This was possibly the first time this tool was used for drawing medical subjects (Thornton and Reeves, 82). The late Eighteenth-century obstetrical atlases of William Smellie, Charles Nicholas Jenty, and

BEST COPY AVAILABLE

William Hunter are landmarks in medical illustration. Jan van Rymsdyk was the artist for most of the illustrations in these works. He also produced drawings that John Hunter incorporated in his 1771 *The natural history of the human teeth* (Thornton and Reeves, 85). It appears that Rymsdyk's first drawings were executed for William Hunter's monumental *work, the Gravid Uterus*. This was the first atlas to depict the pregnant uterus and the fetus throughout gestation. Rymsdyk worked on this project for twenty-two years because of Hunter's wish for perfection. When he had completed Hunter's atlas, Rymsdyk began working on his own publication, the *Museum Brittanicum*. The book expresses his frustrations as a portrait painter forced to earn a living as a medical artist (Thornton, 65). Although Rymsdyk's name appears consistently in Hunter's atlas as the artist responsible for the drawings, he claimed that Hunter neglected giving him the praise he was due. Rymsdyk contended that he would no longer illustrate medically. However, in 1787, in need of money, he returned to the subject of the gravid uterus when he illustrated the male-midwife, Thomas Denman's *Collection of engravings*.

William Hunter was significantly involved in the artistic community for social and professional reasons. He accepted his responsibilities as Professor at the Royal Academy very seriously, arguing in his lectures that anatomy was the foundation of art (Jordanova, 386). Hunter envisioned anatomy and art co-flourishing amongst Renaissance geniuses such as Leonardo da Vinci and Andreas Vesalius and viewed himself continuing in this tradition (Kemp, 144-8). His work, the *Gravid Uterus*, is essentially a product of the Vesalian tradition. The thirty-four illustrations represent the pregnant uterus in life-size, anatomically exact and artistically perfect, according to historian Ludwig Choulant. There were, according to Hunter, two traditions of anatomical illustration. The first was one in which nature was imaginatively reconstructed in the minds of anatomists and artists. Hunter contrasted the first tradition with his own, simple portraits of nature showing the objects as they were seen (Jordanova, 399). Illustrations "that represented what was actually seen" carried "the mark of truth." Hunter stated, "What imitates Nature most is most striking (Kemp, 39)."

Despite such assertions, Hunter's works did not reflect nature. Instead, they fabricated it because of the lifelike quality he added to the cadaver illustrations. This was a technique common in Eighteenth-century anatomical pictures. Parts of the body were shown realistically, often giving great attention to features other than those that were the explicit subject of the picture. Elsewhere, some bodily parts were completely cut off, such as the thighs of a pregnant subject. This view gave the impression that the body was realistically whole, but the amputation showed human flesh caught between the vitality of life and the decay of death. The plates strive to give an impression of life, as in the way the umbilical cord seems wet. This startling effect of combining realism with butchery was very common. Hunter was concerned with body topography, spatial relationships, surface features and particularly textures. For Hunter, these technical details were very important because they combined descriptive clarity with beauty. However, some of his plates are more diagrammatic, showing large parts in detail only (Jordanova, 386).

In the traditional approach to displaying anatomized bodies, only male bodies were depicted (Chewning, 20). The only reason for showing female forms was to highlight reproductive differences. Therefore, the vast majority of illustrated female bodies were pregnant. In the 1700s, pregnant woman imagery provided new visual insights into fetal development. Previously, the fetus was portrayed as a tiny adult body floating in the womb enclosed by a vast amount of open space. The illustrative plates in Hunter's *Gravid Uterus* and Jenty's *The demonstrations of the pregnant uterus* show the full-term child nearly bursting out of the womb. The mother's body frames and molds the fetus. The two lives are portrayed as a single interconnected system (Brock, 47-8). Both Hunter's and Jenty's works are illustrated by Rymsdyk. The plates of pregnancy made for Jenty are examples of mezzotint, a form of engraving that was seldom used in medical illustration of the time (Garrison, 335). Jenty favored mezzotint because the illustrations could be hand colored afterwards, they evoked a three-dimensional appearance, and they were "capable of exhibiting a nearer imitation of nature (Thornton, 55)." In Jenty's work, soft contours are emphasized, and the subjects' thighs are not sectioned as seen in Hunter's atlas. Furthermore, the torso is surrounded by soft, folding drapery. Rymsdyk also illustrated plates in Smellie's *A sett of anatomical tables*. William Smellie, the foremost English midwifery professor, first described the correct passage of the fetal head through the pelvis (Garrison, 214).

In a few cases, as with Peter Camper, the anatomist was his own artist. Camper attended Smellie's midwifery lectures and eventually illustrated his *Tables*. His diagrammatic drawings were further embellished by the engraver in order to enhance their beauty (Thornton, 17). Camper was instrumental in the shift of anatomic portrayal of subjects. He believed that anatomic subjects should be represented architecturally, as da Vinci had done. Following the Vesalian school was Camper's rival, German artist and anatomist, Bernhard Siegfried Albinus. Albinus maintained that anatomic subjects should be presented in perspective, meaning that they should not be drawn as seen from one point of view. Camper and Albinus frequently criticized one another's works, provoking a bitter controversy between them (Choulant, 285).

In a dual role as a painter and anatomist, George Stubbs was unique in English art. His drawings exemplify his extraordinary knowledge of anatomy from which his work is based. Stubbs studied human anatomy under surgeon Charles Atkinson, who also encouraged him to lecture in anatomy to medical students. John Burton asked him to illustrate his book, *An essay towards a complete new system of midwifery*. The book contains eighteen, technically-poor illustrations. The quality of these drawings reflect Stubbs self-taught art of engraving and inability to base them on original observation. The engravings do not bear Stubbs' name because he was not proud of his endeavors into a subject with which he was unfamiliar (Thornton and Reeves, 83). Stubbs based these plates on Albinus' *Tables of the Gravid Uterus*. His style, apart from the obvious delineating of fully rounded forms, shows little deviation from that in contemporary anatomical books (Doherty, 3). Around 1759, Stubbs began work on his *Anatomy of the Horse*. He gained a profound knowledge of the creature through the dissections he performed himself. Thirty years later, Stubbs' interest turned to drawings based on dissection of the human body. This interest in anatomy went far beyond that of any European artist of the period. Stubbs relied on empirical research methods and appreciated anatomy for its own sake. He was not alone, however, in believing that a true knowledge of anatomy could only be gained by first-hand experience (Bignamini and Postle, 22).

While anatomy seeks to explain, art seeks to reveal. When medical illustrations are examined from an artistic point of view, the true beauty of the human form is observed. Early Twentieth-century scientist and philosopher Jacob Bronowski stated in his book, *Science and Human Values*, "It is wrong to think of science as a mechanical record of facts, and it is wrong to think of the arts as remote and private fancies. What makes each human, what makes them universal is the stamp of the creative mind (Chewning, 4)." Whether through the mind of science or the eyes of art, the same creative force has led anatomists and artists to their common goal: an increased knowledge of our inner selves.

The American Canon:
Great Male Playwrights and Their Female Characters

Michelle McGovern

Department of Theater
University of St. Thomas
2115 Summit Avenue
St. Paul, MN 55105

Faculty Advisor:
Mark Pizzato

The Great American Canon of playwrights is a select group of writers who are considered by critics and educators to be worthy of admiration and study. These writers tend to be white males who have been successful on Broadway. The works of these playwrights also tend to exclude women characters "from the subject position [subordinating] her as an object to be attained, an obstacle to be removed or a space to be conquered by the active male subject" (Yarbro-Bejarano 138). These tendencies make it very difficult for a post modern, Chicano playwright who has failed on Broadway to join the canon. Luis Valdez is an influential playwright in Chicano theater but he has been overlooked by the canon despite the similarities between his work and those of such playwrights as Arthur Miller and Sam Shepard.

Valdez's plays are comparable to the greats in the canon in several ways: he has proven to be a financially successful writer (in L.A. instead of on Broadway), he writes plays for a specific audience, his plays are about the state of society, and he focuses his work on men instead of women, who have been relegated to the background. Valdez fulfills these canonical characteristics like Miller and Shepard, yet he is rarely considered to be a "great American playwright." Valdez's work also shares the same flaw as Miller and Shepard: a lack of fully developed female characters.

VALDEZ'S WORKS

Luis Valdez focuses his creative energies on educating and improving the lives of his primarily Chicano audiences. He started El Teatro Campesino in 1965 as a way of bringing plays to migrant farm workers. With those plays came the knowledge that they were not alone in their struggle to gain a better life for themselves and their families. As his play group expanded and began having professional actors and not just workers performing the *actos*, Valdez started focusing on longer, more complex stories.

Valdez's Zoot Suit tells the tale of a man sent to prison for a crime that he did not commit. In Zoot Suit, as in all his plays, Valdez uses stereotypes to make his point. All the characters are defined by these stereotypes: the white do-good supporters, women, and even the Hispanic pachucos. The audience identifies the stereotypes and can rally against the ones it perceives as negative. The obvious stereotypes make the message easier to be identified by the audience and they leave feeling that the problem is not too great to solve.

Each one of Valdez's plays, and its subsequent message, reflects an issue in American society. While Valdez has been doing this for over thirty years, and his technique is effective, using plays to get a social message across to an audience is certainly nothing new to Hispanic theater. In his book Mexican American Theater, one of several that he has written on Hispanic and Chicano theater, Nicolas Kanellas writes that this tactic has been used throughout the history of Mexican theater:

> Mexican/Hispanic theater, besides serving esthetic and entertainment needs, also served the social and political purposes of the community, which conceived of itself at different times as a conquered people whose culture was threatened, later as a colony in exile ('Mexico de afuera'), and today as a minority oppressed by a larger, monolithic culture. (Mexican American Theater 117)

COMMON THEMES

Zoot Suit shows how the press persecutes minorities and has a great deal of control over how the American public thinks, feels, and acts. The use of newspapers for everything from sheets to the judge's bench drives this fact home for the audience. The characters are surrounded by the press and under its influence even while in jail.

Arthur Miller has also written a play about the dangers of letting a handful of people control the way the majority behaves. The Crucible uses the Salem witch hunts as an allegory to the 1950's McCarthyism. One thing that is repeated throughout the play is that an accused person can be set free with no further repercussions if he/she simply admits to being a witch and then implicates a few other people.

A striking similarity between the two plays is the fact that the only way for a character to escape the current situation is to join the accusers and forfeit his/her identity. John Proctor chooses martyrdom rather than lose himself to his accusers. In Zoot Suit, Hank Reyna tries to escape from himself: first by attempting to join the Navy and then by becoming involved with a white liberal woman. In both attempts, he is forced to look at who he really is: a man sent to prison for being Chicano and a man sent, by his white girlfriend, back to his Chicana girlfriend.

Despite the parallel themes in their work, Miller has received more acclaim for his works due to his success on Broadway. Valdez is not viewed as highly as a social critic because of the difference in audiences. Miller's audience is white, upper middle class men and women and Valdez writes for working class Chicanos. Most regular Broadway audiences probably do not know about writers like Valdez simply because these writers are not brought to Broadway. They also are not accustomed to a writer who makes his stereotypes, and his disdain for them, as obviously as Valdez does.

MAKING THE TRADE

Of all the stereotypes in Zoot Suit, the one that Valdez does not seem to be against is that of women. Alice Bloomfield is a Jewish woman who befriends Reyna after he is incarcerated. Alice plays the stereotypical liberal white woman who is determined to fix all the world's problems (presumably because she has none of her own). She is Hank's only contact with the world outside of prison. They are intrigued by the foreignness of each other - there's an appeal to the newness of the relationship and of having a relationship with someone so different from oneself. The audience watches this relationship grow until it culminates in a kiss in prison. She is nothing more than a toy that cheers him up in prison and is later discarded when no longer needed.

Della Barrios is "the girlfriend." She is a paradox because she is a character with no real character. She acts as a narrator to the Sleepy Lagoon incident but that is all the audience sees or hears of her; she conveniently disappears and is not seen with Reyna for half of the play. At the end of the play, she reappears and Alice is traded for Della. This is startling because most of the audience has forgotten her. At the end of the play, Alice sees that she has successfully solved Reyna's problem and volunteers to leave, claiming she is "out of place" (90). But she waits for Hank to choose before she begins to leave, thus completing the trade.

Valdez is not the first playwright to use women as tradable objects in his plays. Arthur Miller and many other playwrights in the canon display women as "exchangeable, perhaps symbolic, property for the primary purpose of cementing the bonds with men" (Austin 47). Gayle Austin's theory of male homosocial desire claims that women are the only thing that come between men and "between men and their fathers" (50). An example of this can be seen in Miller's Death of a Salesman when Happy and Biff trade dates and when Biff finds out that Willy is cheating on his wife with a character who is known only as "The Woman." Willy trades one woman for another depending on what town he is in at the time.

This theory of exchange is also apparent in Sam Shepard's Buried Child. In this play, it is not the father who is caught cheating on his wife. The wife has an affair with their son. There is no explanation as to what went wrong in the marriage or why Halie and Dodge became so estranged; the audience only knows that for some reason, Halie was exchanged or, in this particular play, just given to the son. Halie literally comes between a father and his son. Dodge admits to killing his own grandchild to prevent anyone from knowing its parentage.

> It lived, see. It lived. It wanted to grow up in this family. It wanted to be just like us. It wanted to be a part of us [...] We couldn't let a thing like that continue. We couldn't allow that to grow up right in the middle of our lives. It made everything we'd accomplished look like it was nothin'. Everything was canceled out by this one mistake. This one weakness.

BEST COPY AVAILABLE

> [...] I killed it. I drowned it. Just like the runt of a litter. Just drowned it. (124)

Despite Dodge's confession of murdering an innocent child, it is Halie who is the ultimate villain. After being rejected by her husband for six years, she begins an affair with her son, Tilden. This serves to separate Tilden and Dodge, Dodge from Bradley (another son), and it continues until every male-male relationship is irrevocably destroyed. Halie is the obstacle to be removed.

Although she is the source of the family's problems, Halie doesn't have a coherent conversation with anybody in the play; she rambles on about her third son, Ansel, and the weather whenever she is in a situation that she cannot handle. When faced with a topic of conversation that she does not like, she claims that nothing would have happened if Ansel were alive because he was so much smarter than Tilden, although not as handsome. It is also implied that Halie had an affair with Ansel as well as Tilden when she claims that "Ansel would've stopped [Dodge] from telling these lies! He was a hero! A man! A whole man! What's happened to the men in this family! Where are the men!" (124). She is incapable of defending herself and complains that nobody else will. She is completely unaware of the world around her and is ignored by every other character in the play because she is not viewed as having anything important to say.

THE MISSING WOMEN

Shepard also falls prey to Austin's "missing daughter" theory. Or in this case, the missing daughter-in-law. Austin believes that in most canonized plays, the only significant female role is the wife/mother role and the sons are the only dominate children (48). This is apparent in the casting of Buried Child because there are no daughters and the only female character besides Halie is there for the sole purpose of giving Dodge someone to tell his story to. One character that is blatantly missing is the daughter-in-law. Tilden, in between having an affair with his mother and serving time in prison, also had another son. Vince shows up out of nowhere after a long period of time and nobody recognizes him or even acknowledges his presence. But there is no mention of a mother for him. Shepard has apparently forgotten the basic biological rule that a child needs two parents. The audience is left to wonder what part, if any, this unmentioned character played in the dysfunctional family, why she joined it, and why she left.

Valdez's Bandido is different from Shepard's Buried Child in that there is an abundance of women. All these women are either traded by men or they trade themselves to men. With the exception of Rosario and Rita, all the women in this play are prostitutes that are commonly referred to as "whores" in the stage notes (102). Rita's only role is to chase after a man and insult Rosario because she is jealous of Rosario's "status." She disappears after two scenes and returns for one scene later in the play where, despite the fact that she is married, she continues to chase Tiburcio and tries to replace Rosario. There is very little depth or growth to the character and she does not add much to the play.

Rosario is married but is having an affair with the Tiburcio. After being told "she's only a woman," Rosario, according to the stage notes, "stops and takes control of her own destiny" (134). While that sounds like Valdez is giving women credit, taking control over her own destiny only means that she allowed herself to be traded to the more dominant man. At the end of the play, Rosario is traded again, this time to the Impresario. She, like the other women in Valdez's plays, is "excluded from the decision-making process" and she, of all the women in Bandido, is the most dependent on men for her emotional and financial needs (Yarbro-Bejarano 132).

Kate is the most independent because she earns a living for herself. Unfortunately, her livelihood comes from owning a brothel and her only friend is a man. This shows the audience that she depends on men for everything. Valdez displays women as being completely incapable of independence or survival without someone else to dictate every aspect of their lives. The only control they appear to have is choosing which male shall determine their destiny, and that control is not absolute. While some may argue that the play has a right to treat women in this fashion because it is set in the 1800's, Valdez should remember that not all women in that period were unfaithful to their husbands, whores, and totally dependent on men. An interesting way to change the production of this play would be to give Kate some other occupation (such as being a nurse or a seamstress) or have Rosario choose independence rather than a new husband. These changes would necessitate changing some lines and the direction of these characters.

ADVERSARY WITH THE MALE DOMINANT

The role of the women in Bandido are examples of Kanellas' theory of relationships in Chicano theater; "Adversary with the male dominant" relationships. While most women are not shown as being prostitutes or unfaithful wives in Hispanic theater, they are, unfortunately, commonly portrayed in the roles "of the wife who is not in the limelight herself, makes very few, if any, decisions and contents herself with helping her husband and taking care of the children without making many demands on them for herself" (Hispanic Theater 73,74). This is the role of Dolores Reyna in Zoot Suit and the white Linda Loman in Miller's Death of a Salesman.

Bandido should not be considered a paradigm for all Hispanic plays; Valdez uses sweeping stereotypes to describe all people, but his stereotypes of women seem unnecessarily harsh because they do not appear to be stereotypes he is trying to change. Dolores Reyna has a slightly smaller role in Zoot Suit than Della Barrios. She is of no significance to the play other than being a wife and mother. When her daughter, Lupe, comes in wearing a skirt that is far too short, Dolores tells her to change. When Lupe is caught by the father, Enrique, Dolores tries to use the popular terms and explain to Enrique that she is trying to be "like a puta... I mean, a pachuca" (35). Although she fumbles on the terms, she tries valiantly to be a friend to her children but seems to have no other purpose. In some ways, Dolores Reyna is the ideal mother for most playwrights, she puts food on the table, fusses over her children, and then disappears until the next meal. She does not even react to her son's arrest.

To see Linda Loman in a male dominant relationship, one needs only to look at the stage directions in Miller's play. Linda's actions say more than the dialogue ever could. In Act One, before the dialogue even starts, Linda is described as a woman who is

> most often jovial, she has developed an iron repression of her exceptions to Willy's behavior-- she more than loves him, she admires him, as though his mercurial nature, his temper, his massive dreams and little cruelties, served her only as sharp reminders of the turbulent longings within him, longings which she shares but lacks the temperament to utter and follow to their end. (Miller 6)

Obviously, the audience cannot read Miller's description of Linda's character, so another way to display her weakness is used. The actress who plays Linda must use her tone of voice and her body language to show Linda's attitudes. When the Loman's are first seen together, Linda calls to Willy "with some trepidation" (6). During the course of the conversation, the stage directions show that Linda speaks "very carefully, delicately," "helpfully," and "resigned" (7). Linda is unable to stand up for herself or give an opinion that is truly her own. As the play progresses, Linda is shown "taking his shoes off," "filling his cup when she can," "holding his jacket for him," following him, and finally, "getting him into the jacket" (7,64-65). Her every word and every action revolves around a man who is verbally abusive and spends half the play yelling at her. Despite her apparent love for this man, she cannot even act to save his life when she knows that he is planning to commit suicide.

Linda is more of an extension of Willy, something that is there to serve but will never pose any kind of threat to him, than a character with a mind of her own. It would be interesting to see the play if it were performed without regard to the stage directions; having Willy get into his own jacket, pour himself a cup of coffee, or taking off his own shoes. It would change the play entirely, to see Linda actually employed or at least looking for a job to help out the family. Doing this would result in the focus of the play shifting to Linda Loman and relegate Willy to the background.

CONCLUSION

Through his plays, Valdez has always tried to "inspire the audience to social action. Illustrate specific points about social problems. Satirize the opposition. Show or hint at a solution. Express what people are feeling" (qtd in Yarbro-Bejarano 134). He has also begun to question the theatrical apparatus. This is something that Jill Dolan said more feminists and other resisting readers need to do when she pointed out that

> the theatrical mirror is really an empty frame. By questioning the entire apparatus of theater's representation of women, feminists can 'deconstruct gender categories. If we stop

> considering the stage as a mirror of reality, we can use it as a laboratory in which to reconstruct new, non-genderized identities. And in the process, we can change the nature of theater itself. (qtd. in Austin 19)

Valdez has helped deconstruct images for his audiences and also begun to point out the cracks in the mirror. Unfortunately, like Miller and Shepard who held the mirror up to their audiences to show what is wrong with society, Valdez failed to open people's eyes about the images to which women are confined. When theater is used to suppress people and then proclaimed to be the clearest mirror of life, the line between reality and the fiction portrayed as reality gets blurred and all women must pay the price. The only way to eradicate the negative images caused by the male gaze, is to have more women accepted to the canon (Austin 81). Since that appears to be in the distant future, the first steps can be taken today by allowing Valdez and writers like him to be considered a part of the canon. With the door open to minority playwrights, feminist writers will eventually get the opportunity to join the canon and be accepted as great American playwrights.

Henry Purcell's *Dido and Aeneas:*
A 1689 Composition Endures Controversy

During the past several years, early music scholars have debated several issues concerning the English opera *Dido and Aeneas* by Henry Purcell (1659-1695), including when it was first written and where it was first performed. Until Bruce Wood and Andrew Pinnock openly challenged established scholarship, it was widely accepted that *Dido and Aeneas* was first performed at Josias Priest's Chelsea boarding school in late spring of 1689. However, in Early Music in August of 1992, Wood and Pinnock declare this ". . . impressive edifice of modern commentary . . . [to be] founded on sand" (Wood/Pinnock 'Unscarr'd' 373). Since their article's publication, leading Purcell scholars have addressed Wood and Pinnock's suggestion of 1684 as the date and a court function as the work's première venue. However, despite these new arguments which concern style, political allegory, and similarities of the piece to *Venus and Adonis* by John Blow (1649-1708), I, along with Martin Adams, Curtis Price, and Andrew Walkling, agree that the date first set forth by W. Barclay Squire in 1918 is correct and Henry Purcell's work was indeed commissioned by Josias Priest and first performed at his boarding school for young women in 1689. In this paper, I will: 1) present the historical background of this controversy; 2) explore several sides of the *Dido and Aeneas* issue, and 3) demonstrate both that Purcell's opera was written when scholars had originally dated it and that the contradictory modern evidence is erroneous and not convincing enough to make one think otherwise.

Dido and Aeneas has always been a source of controversy. When W. Barclay Squire first indicated a première date of 1689, it was a fairly radical suggestion. Until that time, scholars generally believed that this opera had been written in 1677 during Henry Purcell's youth; however, Squire viewed this belief as incorrect. In his article in The Musical Times, he found particular fault with the assertion of Sir John Hawkins who stated that:

> "One Mr. Josias Priest . . . kept a boarding school for young gentlewomen in Leicester-fields; . . . he got Tate to write, and Purcell to set to music, a little drama called "Dido and Aeneas"; Purcell was then of the age of nineteen." (qtd in Squire 253)

Squire concluded that this statement must have been incorrect because a copy of the libretto containing the following heading: "An Opera Perform'd at Mr. Josias Priest's Boarding-School at *Chelsey* [sic]" was later discovered (253). Priest did once have his boarding school located at Leicester-fields; however, he moved to Chelsea in 1680. Therefore, if the heading on the copy of the libretto were correct, *Dido and Aeneas* could not have been performed before 1680 because Priest's boarding school at Chelsea did not exist before that time (Squire 253). By relying principally on D'Urfey's Epilogue to the opera for evidence, Squire also presented an extremely sound argument that *Dido and Aeneas* was first composed and then premiered in 1689. This epilogue was first published in a 1690 book entitled *New Poems*, however, the publisher of *New Poems* had already released a similar work entitled *A New Collection of Songs and Poems* in 1683. Squire's conclusion was that the Epilogue was written sometime between the publications (1683-1690). Squire then narrowed this seven year span for Purcell's premiere to two years (1688-1690) by focusing on the religious upheaval in England at the time to which he believed D'Urfey alluded in the Epilogue:

> Rome may allow strange tricks to please her sons,
> But we are Protestants and English nuns,
> Like nimble fawns, and birds that bless the Spring
> Unscar'd by turning times we dance and sing. (qtd. in Buttrey 52)

BEST COPY AVAILABLE

The political allusions in the Epilogue were later explained by John Buttrey in his essay "Dating Purcell's *Dido and Aeneas*" published in the Proceedings of the Royal Musical Association in 1967. Here he describes how England's political and religious climate at the time of Purcell's opera could be termed "treacherous" at best. James II, a known Catholic, succeeded King Charles II in 1685 and foolishly made a habit of flaunting his religious affiliation, something that, at the time, was safe to do because the English people were frightened by the turmoil and Protestant genocide occurring in France. However, the English Protestants took comfort in the fact that James II had a daughter, Mary, who not only was a child from his first wife and raised in the English Church but also was in line to inherit the throne. This false sense of security turned into England's greatest "fear come true" when James II and his second wife bore a son who replaced Mary as heir to the throne. At this time, believing the birth to be a fraud and that Mary had been cheated out of her rightful inheritance, several important Englishmen appealed to William of Orange for help. In the end, James II and his family fled to France and William and Mary ascended the throne as joint rulers (Buttrey 53).

From this historical background, Buttrey draws strong parallels to D'Urfey's Epilogue:

> The remark, 'Rome may allow strange tricks,' refers to the supposedly fraudulent birth of a son to James and his Catholic queen. Such a comment could only have been made *after* William and Mary had ascended the English throne. It has therefore been conceded that the opera must have been performed sometime after February 1689 but before the Autumn of that year when D'Urfey's Epilogue appeared in print. (53-54, italics added)

Thus, Squire's became the prevailing argument to support Purcell's work as having premièred in 1689 at the Chelsea boarding school. The aforementioned argument first introduced by W. Barclay Squire in 1918 had been the driving force in Purcell scholarship until August of 1992 when Bruce Wood and Andrew Pinnock published their article "Unscarr'd by turning times?" in Early Music. In it they proposed that Purcell's opera debuted in 1684 and the performance at Priest's school in 1689 was merely a revival. They cited many examples of style in this music that they believe were inconsistent with his later works, e.g., doubling of the string parts, tessitura of the vocal parts, the use of ground bass, his declamatory writing, and its similarities to John Blow's *Venus and Adonis*. In addition to these questions of musical style, Wood and Pinnock also conclude that the Prologue is not a political commentary on the Glorious Revolution as other scholars had suggested, but rather alludes to the harsh winter and cold spring in England in 1684.

First let us examine Wood and Pinnock's principal arguments concerning musical style. They have difficulty believing that an opera composed in 1689 still displays musical traits characteristic of Purcell's earlier works. Concerning the composer's treatment of stringed instruments, Wood and Pinnock assert that because he only doubles the voices in unison, the opera must be an earlier work. They claim that after the mid-1680s, "Purcell's mature concerted music derives much of its thrilling sonority from using the strings either to add at least one independent part . . . or consistently to double voices at the octave" (Wood/Pinnock 'Unscarr'd' 377). While they concede that Purcell does use unison doubling after 1685, they maintain that this practice is confined to the anthems he composed for the Chapel Royal.

Another feature of *Dido and Aeneas* that bears striking resemblance to Purcell's early works is the use of ground bass. Wood and Pinnock suggest that the scalic bass Purcell used in 'Oft she visits this lov'd mountain' is too similar to his songs *Swifter Isis, swifter flow* (1681) and *The Summer's absence unconcerned we hear* (1682) to be a coincidence (figure 1) (Wood/Pinnock 'Unscarr'd' 377).

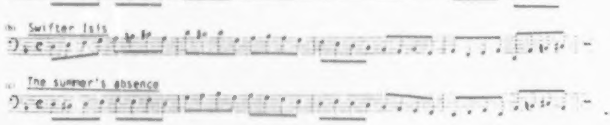

Figure 1: Three scalic basses in Purcell's works

Wood and Pinnock also cite *Dido's* declamatory writing as being characteristic of an earlier time in Purcell's development. They point out that in his later works he makes text declamation more melodic rather than relying on the direction of the vocal line and the cadential structures (Wood/Pinnock 'Unscarr'd' 378). Wood and Pinnock conclude that there is more arioso writing than would be needed in a piece intended for performance by schoolgirls. This quantity of arioso is also characteristic of his earlier works because it is built on a slow-moving harmonic bass line (Wood/Pinnock 'Unscarr'd' 381).

The wide tessitura of the voices is another musical feature of *Dido and Aeneas* that Wood and Pinnock declare as not only uncharacteristic of Purcell's early works, but also uncharacteristic of the musical period as a whole. In *Dido and Aeneas*, Purcell set the treble voice a considerable distance away from the rest of the voices; according to Wood and Pinnock, this spacing was a "striking feature" of the early Restoration period, but was "By the late 1670s . . . becoming rare . . . [although] the gap between treble and countertenor parts lingers on into the *early* 1680s" (Wood/Pinnock 'Unscarr'd' 377, italics added). Wood and Pinnock then observe that the gap was more than two octaves in some parts of *Dido and Aeneas*, yet such a large tessitura was practically nonexistent in any type of music after 1683 (Wood/Pinnock 'Unscarr'd' 377).

When analyzing musical style, Wood and Pinnock readily compared Purcell's work to one of his contemporary composers, John Blow, and his work *Venus and Adonis*. Blow and Purcell had a symbiotic musical relationship, i.e., both were consistently borrowing from one another. Furthermore, Wood and Pinnock point out that each of them borrowed from the other's more recently composed works rather than the other's older pieces. Purcell's interpretation of Blow's ideas was evident in the structure of his work as well as the specific musical ideas, e.g., qualities of texture, tonal pattern, and scoring for voices and instruments. One example of Blow's work that Wood and Pinnock compare to *Dido and Aeneas* is the following bass line (figure 2) (Wood/Pinnock 'Unscarr'd' 383).

Figure 2. Bass Line by John Blow

One should also notice the similarity that this passage bears to 'Oft she visits' (figure 1). Wood and Pinnock fervently claim that "It is highly unlikely that Purcell in 1689 would have been borrowing wholesale from Blow's *Venus and Adonis*, written six or seven years earlier. Yet borrow he did . . ." (Wood/Pinnock 'Unscarr'd' 381).

Purcell was as clever with his technique of borrowing material as he was with his allusion to the harsh winter of 1683-1684 and the cold spring that followed it. Wood and Pinnock compared the observations of two people whom they declared weather experts, John Evelyn, an English gardener, and Nahum Tate, the librettist of *Dido and Aeneas*. Late 1683 and early 1684 were characterized by strange weather conditions including both an extremely harsh winter and cold spring. Wood and Pinnock first suggested that several places in Tate's libretto conform rather nicely--too nicely to be a coincidence--to Evelyn's diary of the actual weather conditions of that time and then through that comparison concluded that "they provide the key to Tate's seasonal allegory in the *Dido* prologue, and help incidentally to date it" (Wood/Pinnock 'Unscarr'd' 389). However, despite his allusion to the cold spring of 1684, Wood and Pinnock dismissed any chances of allusions to the political climate of the time in the Prologue, even though they do admit that political allegory in the Epilogue is not only possible, but probable. They refuted several examples in Tate's libretto of what other scholars had examined as possible political allegory including the phrase ". . . To the new rising star of the ocean." Whereas Buttrey claimed that this verse was a clear welcoming of William from Holland, Wood and Pinnock maintain that the 'new rising star' is simply Venus physically rising out of the ocean, not William crossing the Channel (Wood/Pinnock 'Unscarr'd' 374-375).

Having summarized the main points of Wood and Pinnock's argument, I will now examine a few refutations beginning with a short letter written to Early Music in August 1993 by Martin Adams of Trinity College in Dublin. While Adams appreciates Wood and Pinnock's efforts and acknowledges that they do make some good points (e.g. *Dido and Aeneas*' similarities to John Blow's work) he nevertheless states that "their stylistic evidence is less solid, for to make their case they have chosen just about the least reliable indicators" (510). Adams declares that:

> In such a style-conscious composer as Purcell, conclusions based on comparisons between genres are hazardous when confined to generalized, essentially surface features such as melodic versus declamatory methods of word setting, and the relationship between choral parts and accompanying instruments. (510)

BEST COPY AVAILABLE

More specifically, Adams challenges their scholarship by citing the 'God save the King' chorus in the *Welcome Vicegerent* ode, written in 1680, as an instance where the strings are nearly completely independent of the voices. This challenge is furthered when Adams claims that their analysis of the ground basses is just plain wrong because they are not ground basses at all, but are instead rhythmic ostinatos. He also contends that the declamation of text:

> . . . is not unusual for the late 1680s, either in quantity or style. Granted that it is different from that in the odes; but it is similar to dialogues and recitative songs . . . from the mid-1680s or later. . . . (510)

Adams is not the only scholar who remains unconvinced by their conclusion; Curtis Price and Andrew Walkling also criticize their arguments. Price disapproves of both their comparison to Blow's work and their analysis of Purcell's musical style; Walkling takes issue with their interpretation of allegory in the libretto. First, I will delineate Price's refutations and then Walkling's arguments. In February 1994, Price attacks Wood and Pinnock's close comparison of *Dido and Aeneas* with Blow's *Venus and Adonis*. Price claims that even though *Venus and Adonis* can be a major source for understanding Purcell's work, one cannot simply conclude that the latter of the two works follows in the exact footsteps of the earlier since "[al]though Blow's opera was revived at Priest's school in April 1684, its actual date of composition is *unknown*" (Price 116, italics added); Price later warns his audience against compounding assumptions. Also in his article, Price challenges Wood and Pinnock's interpretation of Purcell's musical style. First and foremost, Price asserts that:

> While Purcell's style obviously changed between 1684 and 1689, I would maintain that the change is not as pronounced as that which happened about 1689-1691, during which time Purcell reached maturity as a composer and fully synthesized the latest French and Italian styles. (117)

Therefore, Price concludes that it would not be unusual if, in 1689, *Dido and Aeneas* was more like his earlier works than his later ones. He also accuses Wood and Pinnock of only citing musical examples that support their argument and ignoring those that refute it. Furthermore, Price points out a characteristic of style which he believes is interpreted wrongly by Wood and Pinnock, i.e., Purcell's declamatory writing. Price asserts that the declamatory writing in *Dido*'s 'Whence could so much virtue spring?' is quite different from Purcell's earlier works such as 'Ah had we, Sir, the pow'r' from *The Summer's absence unconcerned we bear*. Notice that in 'Whence could so much virtue spring?,':

> . . . both melody and accompaniment work together to reflect the text: in the latter the voice and continuo are much less integrated. Notice especially the elaborate melisma on the insignificant word 'of' in the phrase 'One entire piece of harmony.' (Price 120)

After Price refutes Wood and Pinnock's claims regarding musical style, Walkling becomes a part of the *Dido and Aeneas* controversy with the first of his two articles analyzing the opera. The two subjects on which he disagrees with Wood and Pinnock are the issues of musical style and the use of allegory. On the question of style, Walkling asserts that:

> Wood and Pinnock seek to demonstrate that a change took place in Purcell's compositional style at some point between the early 1680s and 1689 or later. Yet . . . the date on which the change actually came about is not firmly established, and is sometimes left to fall anywhere within a space of up to seven years . . . . (Walkling 'Dating' 471)

This assertion makes a comparison of compositions a bit more challenging. Walkling also studies the use of allegory in *Dido and Aeneas* and concludes that it is unusual for Tate, in the libretto, to concentrate so heavily on the reference to spring when the harsh winter of 1683-1684 is, as Wood and Pinnock claim, really the most memorable. Walkling also sees it as unlikely:

> . . . for Tate to employ an obscure allegory in order to make reference to something as straightforward as the weather, particularly if, as Wood and Pinnock suggest elsewhere, that allegory had no other more significant motive, such as praising a king and queen. (Walkling 'Dating' 470)

In an article written more than a year later, Walkling again asserts that Wood and Pinnock's disregard of political allegory is incorrect. He feels that it is erroneous to think of Purcell not utilizing allegory in his composition because "political allegory was central to the functioning of high culture in seventeenth-century England" (Walkling 'Political Allegory' 541).

A consideration of all of the arguments and counter-arguments surrounding this issue is more than a little challenging. However, after much reflection, I am still unconvinced by Wood and Pinnock's argument that *Dido and Aeneas* was written in 1684 instead of 1689 and that its premiere was at a court function rather than Priest's boarding school in Chelsea. First, I am skeptical about their study of musical style. For example, perhaps Purcell's doubling of voices by the strings was necessary to support the young voices in the Chelsea school. If Purcell was commissioned to write the opera for school children, he would have taken great pains to assure that this work could have been performed by young musicians. With regard to *Dido and Aeneas*' ground bass, Purcell could have, in 1689, borrowed some of his earlier material just as easily as he could have in 1684, thus making Wood and Pinnock's argument moot. I also agree with Price's opinion regarding Purcell's declamatory writing. 'Whence could so much virtue spring?' appears to be more similar to *Now does the glorious day appear* than it is to 'Ah had we, Sir, the pow'r' if one takes into consideration the uses of melismas. Therefore, I suggest that the exact opposite of Wood and Pinnock's argument is true and that Purcell's declamation of text in *Dido and Aeneas* is much closer to that which he used in later, not earlier, works.

I also suggest that Wood and Pinnock are too hasty in their judgment of the allegory in Tate's libretto. Why would he include a complex allegory on the subject of weather and completely leave out any mention of the political turmoil in England? Fine art has always reflected the time in which it was produced and the society in which it was born. Therefore, since England at this time was in the middle of internal turmoil, that turmoil *has* to have been reflected in at least some of the fine art produced at the time. I also support Walkling who states that any reference to the tumultuous weather of 1683-1684 would have probably focused more on the harsh winter than the spring that followed (Walkling 'Dating' 470). Nevertheless, even if Tate does utilize some sort of reference to the weather, I must still agree with Buttrey that the true allegory is in Tate's references to the Glorious Revolution (52-54). To ignore Tate's allusions to the scandal surrounding James II's supposed heir and the welcoming of William and Mary as rulers would be, I feel, a complete oversight.

Finally, I cannot be convinced by Wood and Pinnock's arguments because a good portion of them are based on a major assumption, i.e., the compositional date of John Blow's *Venus and Adonis*. How can one date *Dido and Aeneas* by comparing it to another work with an equally uncertain date of composition? In this instance, I must again agree with Price and his warning to audiences regarding arguments that are based on pure conjecture and assumptions (116).

In conclusion, the reader has both been made aware of the findings of the major scholars on the various sides of the *Dido and Aeneas* issue and has been informed as to what my personal conclusions are in reference to the available scholarship. I believe that in the past hundred years, W. Barclay Squire has given the academic world the most probable hypothesis regarding the composition date of Purcell's opera and that his hypothesis has been adequately supported by other, later Purcell scholars including John Buttrey, Curtis Price, and Andrew Walkling. However, despite any of these scholars' convincing arguments and academically and musically logical proposals, until a diary or newspaper article or other definitive document is found, the *Dido and Aeneas* controversy will probably continue to rage.

Determining the Authorship of the Toccata and Fugue in D Minor, BWV 565

Dr. Patricia Kazarow

One of the most famous organ works of Johann Sebastian Bach (1685-1750) is the *Toccata and Fugue in D Minor*, BWV 565. Traditionally this piece was thought to have been written by the prolific composer sometime between 1705 and 1710. There has been some controversy surrounding this hypothesis, however; some scholars, Peter F. Williams and David Humphreys, in particular, now contend that the piece was not even written by Bach, because it is too inconsistent with his other compositions to be a work of the Baroque master. They propose several alternative hypotheses; in them, neither attributes the piece to Bach. Despite their claims, I believe that Bach was, in fact, the true composer of this popular organ work. In this paper, I will: 1) describe the context in which the piece was composed, according to the traditional hypothesis; 2) give a brief analysis of the work; 3) consider the arguments presented by these musicologists and further investigate their claims; 4) refute these claims and show that their evidence is not sufficient to warrant the questioning of the authorship of this work.

To gain a greater understanding of the piece, it is helpful to consider the traditionally accepted conditions under which it was composed. The *Toccata and Fugue in D Minor* has been classified with the works composed during the second portion of Bach's Arnstadt period (1705-1707). Many of his compositions from this period display the influence of other early eighteenth century German composers. For example, the young Bach had just made a trip to Lübeck where he observed the great Dietrich Buxtehude (c.1637-1707). He returned from this trip with confidence in his growing abilities as an organist and composer. He began to realize that he would have to leave his position at Arnstadt if he wanted to further develop these abilities (Keller 73). The pieces he wrote during this period were works that would catch the attention of future employers. The flashy *Toccata and Fugue in D Minor* with its dazzling effects is no exception, as can be clearly seen by analyzing the piece.

A detailed analysis of the work reveals that this haunting piece is actually quite simple in construction and compositional technique. It can be divided into five major sections: 1) an introductory toccata (m. 1-30); 2) the fugue (m. 30-59); 3) a cadenza-like section (m. 59-86); 4) a return of the fugue (m. 86-127); 5) a second cadenza which closes the work (m. 127-143).

The opening toccata consists of a series of rapid keyboard figures used for dramatic effect, unified by reliance on a C# fully diminished seventh chord. Included in the first two measures are a pair of descending scale passages in octaves, followed by an arpeggiated C# fully diminished seventh chord and its resolution to the tonic. In measures 4 through 10, there is a sequenced three note ascending scalar figure doubled at the octave and its reiteration an octave higher, followed by arpeggios that are sequenced downward until they again reach the C# fully diminished seventh chord. The highest Bb of the chord continues to be held after the chord is released and is used as the beginning note for a descending scale passage followed by an arpeggiated dominant seventh chord, which resolves to a held tonic chord. Measures 12 through 15 consist of a sixteenth note melody in the right hand, while the left hand interjects an A between each two notes of the melody. This idea of returning to the dominant pitch between each note of a melody plays an important role in the subject of the fugue, which will be discussed in detail later. Measure 16 is a simple arpeggio sequenced three times, followed by a VI-v-i-V progression. Measure 17 is an exact repetition of measure 16; however, this time an A is held over after the rest of the chord is released to begin a solo passage. The passage is followed by a second VI-v-i-V chord progression, then a third repetition of measure 16, this time an octave higher than the original, and another short solo passage which ends with the now familiar C# fully diminished seventh chord. This chord serves as a transition to the next five measures that contain a sequenced triplet figure based on the arpeggiation of that chord. The sequencing ends just before the third inversion dominant seventh chord in measure 27, which resolves to a first inversion tonic chord. Then the pedal plays descending thirds in sixteenth notes, followed by a pair of dominant-tonic progressions to end the toccata section.

The second section is the exposition of a four-part fugue. The subject of the fugue was alluded to in measures 12-15, where the melody was broken up by a reiteration of the dominant pitch between each note. In this case, the melody line starts on the subdominant, descends the minor scale to C# and ascends to F before dropping to A and ascending in a melodic minor scale pattern. The countersubject is very simple--an eighth note pattern that mainly moves in parallel sixths (or occasionally thirds) with the melody of the subject. The subject is presented first in the tonic key by the tenor voice, then answered by the alto voice in the subdominant key, which is not the usual key for an answer. A short episode returns the piece to tonic for the soprano's presentation of the subject in measure 39, followed by ten measures of sequencing and modulation before the bass presents its answer in the pedals. Then a rising bass line supports the sequenced sixteenth notes in the right hand for three measures, after which the subject is again present in the tenor voice, this time in F major, the relative major of the tonic.

The third section begins abruptly after the F major statement of the subject. Instead of a section developing previously presented material, which would normally be expected at this point, the piece moves into a soloistic section that commences with a sequenced descending scale pattern that eventually changes to a sequenced arpeggio in measure 66. Then, as if to reassure the listener that this is just an interlude and that the fugue is not over yet, the subject is stated in the soprano voice in measure 70. The statement is immediately followed by more sequencing of arpeggios until measure 83, where scale patterns begin to lead into the next section.

The fourth section is the continuation and conclusion of the fugue with the development of subject and countersubject material. It begins in measure 86 with a statement of the subject in C minor in the pedal. This statement is immediately followed by a statement of the subject in the alto voice, also in C minor. Measures 91 and 92 modulate through the use of sequencing in the soprano voice to reach the dominant key in measure 93, where a presentation of the subject occurs in the tenor. More sequencing and modulation take place until measure 103, where an inversion of a fragment of the subject is played in the left hand, followed by the appearance of the subject in the alto voice in the tonic key. A few measures later, the pedals also play the subject in the tonic key, this time unaccompanied. This presentation of the subject is followed by a sequenced bass figure supporting melodic fragments in the upper voices. In measure 115, there is a brief reappearance of the arpeggiated material from section three; however, this time the pedals play a D on beats one and three of each measure, giving it a sense of purpose and forward motion. Then in measure 120, the bass line begins to play sequenced fragments of the subject, building intensity, as the manuals play rapid chord progressions over it. This leads to the final statement of the subject in the same voice in which it was originally presented over a tonic pedal tone in the bass. The fugue concludes after a chord progression in eighth notes with a deceptive cadence over the bar line from measure 126 to 127.

The deceptive cadence sets up the final section of the piece, which begins in bar 127. Rapid four note Bb major scale segments open this section, which eventually modulates to G minor in measure 129 with the introduction of F-sharps and an E-natural. Then two more modulations occur in quick succession in measures 130 and 131, both through the use of fully diminished seventh chords. Then, just when the piece appears to be cadencing in A minor in measure 132, a C major chord is held on the downbeat of measure 133, which begins another rapid passage of sequencing, this time predominantly in C major. This passage leads to measure 137, where a sequence made up of block chords and arpeggios of those chords begins. The sequencing continues until a circle progression is made from V/iv to iv in D minor on the downbeat of measure 141. This chord begins the suspension-laden chord progression that brings the piece to a close with a iv to i plagal cadence in the original key of d minor.

Now that a brief analysis of the piece has been made, we can begin to evaluate some of the aspects of the work that musicologists cite as evidence that the *Toccata and Fugue in D Minor* was the work of another composer. One of the first points made is that there is no existing autograph manuscript; the earliest extant copy of the piece was made in the mid-eighteenth century by Johannes Ringk (1717-1778), a pupil of J.P. Kellner (1705-1772), who in turn was a pupil of Bach. There is no reason to question Ringk's integrity, however. There are many extant examples of pieces he copied in Bach's name that are known to have been originally composed by Bach, for example, the *Wedding Cantata* BWV 202 (Williams, "BWV 565" 337). It is unlikely that he would have knowingly misattributed a work to Bach. This information, however, led Humphreys to propose that the piece was actually written by Kellner, and later copied by Ringk (216). This hypothesis also seems unlikely. Humphreys himself admits that any similarities that can be found between Kellner's works and this one are definitely not conclusive (216). Nothing closely resembling the dramatic devices used in the *Toccata and Fugue in D Minor* are apparent in a survey of some examples of his writing. Also, Kellner's use of the pedal differs significantly in these samples of his work. After its entry in the fugue section of each example, he continues to use the pedal almost continuously throughout the rest of the piece. In the *Toccata and Fugue in D Minor*, the pedal is used much more sparingly, a technique more characteristic of Bach's works. In addition, the structures of his pieces in no way resemble the unusual structure of the *Toccata and Fugue* in question. The hypothesis also does not explain how copies of *Toccata and Fugue in D Minor* were made in the early nineteenth century by J.A. Drobs (1784-1825), a student of J.C. Kittel (1732-1809), another student of Bach (Williams, Organ 214). It seems unlikely that two different students of Bach would have passed down the same misattributed piece.

Williams offered another explanation. His hypothesis is that it may be an organ transcription of a piece originally for solo violin by another composer ("BWV 565" 335). Many arguments can be made against this hypothesis. First, the dramatic, overpowering effect that the opening toccata has on the listener could not be replicated by a solo violin, since it is not idiomatic for the violin. Many sections would have to be significantly altered to make them

BEST COPY AVAILABLE

possible to be played on that instrument. The reiteration of the dominant in the subject of the fugue would be logical for performance on the violin, because it would utilize neighboring strings, but Geiringer stated that this technique was often used by Bach in his works for keyboard (244). However, even if the piece, as Williams also suggested, had been written originally for violin in the key of A minor, transposed up a fifth, more than one-third of it would still contain notes that fall below the range of the violin. A four-part fugue would also not be idiomatic for solo violin; furthermore, it would be unlikely for a violin soloist to play one voice of a fugue, and have the rest of the voices filled in by an accompanying keyboard. Even Williams states that there is no known violin piece, by Bach or any other composer, that even resembles the *Toccata and Fugue in D Minor* (Organ 220). Taking all of these considerations into account, it would seem that this hypothesis is also unlikely.

Another criticism of the work that has been made by musicologists, particularly Williams, is that the piece is too simple and unusual to have been written by Bach, and that it does not fit stylistically with his other works. We will now consider some of the piece's unique components individually.

The opening bars of the piece are identified as unusual by Williams, who states that it is odd to begin an organ work with such a doubling ("BWV 565" 331-332). On the other hand, if the piece were a programmatic work depicting, for example, a violent storm, as Pirro suggests, the octaves create the perfect effect (35). This hypothesis would also explain another oddity, the work's unusually heavy reliance on the fully diminished seventh chord, especially in the opening toccata. This is one of the first works after the development of tonality that exhibits such frequent usage of this chord. But in this instance, it is not only effective as a programmatic device, it also unifies the series of seemingly unrelated, improvisitory subsections of the toccata.

Another oddity can be seen in the final cadence at the end of the piece. The minor plagal cadence (iv-i) is unusual. It does not give the piece a sense of closure, and, at the end of such a powerful work, it seems both anticlimactic and understated. The cadence still seems too weak even if the F in the final chord is raised to an F#, creating a Picardy third which was commonly used in Bach's time and may have been accidentally omitted by a copyist. Ending with a major chord instead of the D minor chord does provide a feeling of relief, as one would feel after enduring a storm, if Pirro's hypothesis is adopted. The major chord also fits in well with the rest of the closing section, with the section's reliance on major scale fragments in measures 127-129 and 133-136.

Williams also finds it anomalous that the pedal enters and plays a solo in measures 109-111 ("BWV 565" 333). However, examination of other pieces shows that such usage of the pedal is not unusual in Bach's organ works. For example, in *Prelude and Fugue in A Minor*, BWV 551, the pedal enters and plays a solo on two occasions, once in measure 78, and again in measure 82 (Figures 1 and 2) (Bach, Ser. 4, V. 6).

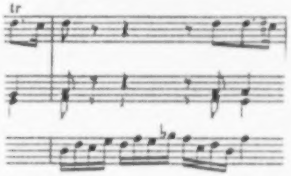

Figure 1 - BWV 551, m. 78

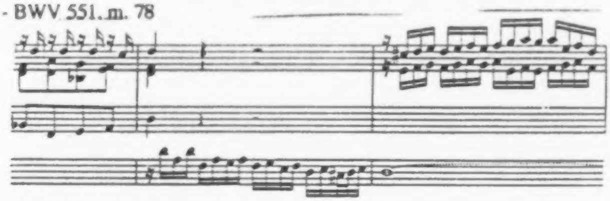

Figure 2 - BWV 551, m. 82-83

In the solo pedal example in the *Toccata and Fugue in D Minor*, the reiteration of the dominant every half beat implies harmony to the listener, a device that does not occur in BWV 551. Other examples of solo pedal passages in Bach's organ works can be found in BWV 535, BWV 536, and BWV 543. And in BWV 532, there are sixteen separate solo pedal figures of similar length to that in *Toccata and Fugue in D Minor*. So Bach's usage of the pedal in this instance is neither unjustifiable nor out of the ordinary.

Another difficulty Williams asserts when claiming that this piece should not be attributed to Bach is the extensive reliance on one harmony for sustained periods, such as the C# fully diminished seventh chord in measures 8-10 and 22-27 and the long string of arpeggios in measures 66-70 and 73-82 ("BWV 565" 333). Again, these chords, especially the fully diminished seventh, may have been used for dramatic effect or programmatic purposes. Geiringer suggests that the arpeggios in the third section served to retain the sense of improvisation created by the opening toccata (244). So these passages also fit well with the rest of the piece and its composer.

Finally, Williams argues that the piece is too simple both harmonically and contrapuntally to have been composed by J.S. Bach ("BWV 565" 333). After careful analysis of the score, the work does in fact seem simple in composition. Scalar passages and arpeggios dominate the piece. Sequences can be found abundantly. The countersubject consists of simple parallel sixths and thirds with the subject. That many of the piece's elements are simple, however, is not proof that it was not conceived by a great composer. There is often beauty in simplicity, and the enduring popularity of the *Toccata and Fugue in D Minor* shows that many listeners have found some of that beauty in this piece, regardless of whether or not the piece deserves its lofty status on technical grounds.

These individual arguments can also be refuted collectively if one considers that no one, not even the great Johann Sebastian Bach, was born a great composer. He too had to learn the principles of polyphonic writing and voice leading. If this *Toccata and Fugue* was written in approximately 1705, as has been traditionally accepted, then Bach was still in his youth at the time the piece was composed. This could help explain many of the perceived abnormalities identified by the musicologists quoted earlier. Perhaps these slightly unusual figures were the work of a young Bach, who was still struggling to find his voice as a composer. The piece does exhibit many of the characteristics cited by Keller as indicators of the work of a young composer (35-37). As J.N. Forkel once stated, young composers are commonly apt to "run riot up and down the keyboard, to play as many notes as the five fingers of each hand can manage, and to continue in this wild course until some point of rest is reached by chance" (qtd. in Keller 35). The opening and closing toccatas and the middle section are examples of such fast passages; in the opening toccata, the passages often, cleverly, come to "rest" on fully diminished seventh chords, which offer no sense of relaxation in functional harmony. Indiscriminate doublings are also regarded as the work of a young composer. The octave doublings at the opening of the *Toccata and Fugue in D Minor* are not best described as "indiscriminate," but they may help to attribute the piece to a younger Bach. The unusual pedal entry, the minor plagal final cadence, and any perceived weaknesses in contrapuntal ability could also be explained by noting that this is an early Bach work, and that he was still developing his compositional technique to the fine art form that one sees in his later masterpieces.

In conclusion, after careful consideration of all the evidence we currently have, it would be premature to discredit Bach as the composer of this famous, admirable, and enduring work. The dramatic effects and irregular structure of the piece are not uncharacteristic in organ literature, nor is it inconceivable that such a piece could have been written by a young J.S. Bach. What we see in this *Toccata and Fugue* is the work of a developing composer who shows some of the flashes of brilliance that eventually evolved into the mastery of his craft and made him and his works immortal.

Plains Attire:
The Individual Expression of Culture, the Cultural Expression of Identity

Anne Guernsey Allen

Apparel is simultaneously the most personal and the most public statement of one's self-identification.[1] Historically, clothing worn by North American Plains Indian cultures has been used to show individual status, wealth, and prestige. Although there are distinct differences between male and female generated art, Plains attire evinces deeply embedded statements about individual power, personal and cultural identity. Decorative patterns, colors, accouterments and clothing styles are often reflective of the preferences of the producing artists' group affiliation. Influence from outside cultures, from migration, and from technological advances, have all affected Plains attire, yet many of the considerations that date from the 1700s still apply today.

The formal clothing of the plains peoples serves as a record of their cultural, social, and world-views. Male art is in no way intended to be subtle (Allen 1996). It denotes in absolute terms an individual's history, describes power, and includes the rights to special accouterments. Men's attire can be "read" by those who know the codes. Present-day iconography has evolved from the pre-reservation period when a man's actions in battle, politics and other strategic events were often prominently displayed on his shirt, horse and home--blatant visual reminders of the personal history of a man. Scalp locks were taken from slain (or bested) enemies, knotted at one end and worn dangling, fringe-like, from a shirt. Among some groups, friends and admirers of an individual may have cut scalp locks from their own head, and donated them as tribute (Marks 1996). Pictographic symbols on men's robes provided a visual record of an individual's accomplishments. Feathers (eagle feathers in particular) were the prerogative of warriors, and were only worn by those who had earned them in a display of courage or bravery. A single eagle feather was enough to relate the ability of a man to back big words with actions.

From the beginning of the historic period, men's attire has also been effectively used as a strong statement of the influence of an individual. Government systems revolving around councils and inter-tribal occasions of state often demanded that individuals represent the nation or band. In official circumstances, the prerogatives of authority and honor were prominently displayed. The Plains Indian was so accustomed to the use of formal attire to denote status that a Blackfeet chief accompanying Prince Maximillian zu Weid on his tour of the plains the 1830s commented that he was "much surprised that the whites always appeared in their common, everyday clothes, whereas they (the chiefs) always put on their handsomest dress" (Thomas and Ronfeldt 116).

There is a clear differentiation between male and female generated art. Female generated art is typically abstract or geometric in design. Items produced by women often include images titled with reference to features of life on the plains: "mountain", "river", "tipi". Women's art conveys ideas more subtly than does male art, and is clearly the more conventionally "artistic" choice. Where men's images are conveyed so as to leave clean, concise messages, women's art can be said to leave lasting impressions (Walker and Maynard 206, see also Corbin 110).

Women's art was used to beautify and adorn the attire of all members of her family, but many garments worn by women also served to manifest family wealth. Even a child's dress might be adorned with cowrie shells and bead work. In the reservation period, cowrie shells represented a substantial investment, having been traded at great distance and expense. In the pre-reservation period, elk teeth would have been used to substantiate accumulated wealth (Furst 176, see also Karklins 101, 132-35; Furst 176).

In the 19th century, articles made by women became popular trade items, exchanged among other Indian nations for horses and goods, and with Europeans for cloth, beads, and metal objects (Penney 30-34). The skill of some artists resulted in extensive recognition of their work. Guild association may have helped to influence the bias toward distinct group preferences in style, color, and pattern. Many items were traded at great distances, so variation of design alone does not allow precise identification of origin; there is, however, a tendency toward tribal preference for certain compositional groupings. These patterns have long been debated. In the early 1900s, anthropologist Franz Boas addressed the issue of context and content in decorative applications. Boas made several generalizations, including the idea that groups incorporated designs into their repertoire, and then assigned meaning to the image in accordance with the contexts of their own cultures. According to Boas, "The idea which a design expresses at the present time is not necessarily a clew [sic] to its history. It seems probable that idea and style exist independently, and influence each other constantly"[2] (Jonaitis 16-25).

As assimilation into white culture progressed, some types of traditional clothing continued to gain cultural importance. Long after it had become the custom to wear European fashions, formal attire retained its emphasis on the older materials and styles. In an effort to hasten assimilation into white culture, government agents and missionaries tried to dis-associate native peoples from "traditional" clothing. According to Erdoes, "Schools prided themselves on pictures [of] Indian children arriving at school in blankets and moccasins and three months later the same children in collars jackets and bow ties." (67). Additionally, children were not allowed to speak their native languages, or practice non-Christian rituals; by the time they had completed their educations, most students felt alienated from their birth-culture.[3]

Some types of clothing did sucessfully cross the barriers made by white American culture. Female artists were remarkably proficient in translating perferred designs into new media. Many Plains groups originate from east of the Mississippi. The Woodland people, exposed to French embroidery techniques, had incorporated floral designs into their work. As Plains women acquired small, rounded seed beads through trade, they shifted from quill to beadwork. Artists experimented with elements of style, generally retaining earlier tendencies toward favored patterns despite the transistion from flat to round media. Penney offers an interesting view of the incorporation of exotic trade goods into native American attire:

> When European traders offered their Indian partners glass beads, silver brooches, silk ribbons, and colored cloth these materials were interpreted in terms of their symbolic implications and potential for power. ...The 'trinkets and baubles' dismissed as trivial when traded away by the Europeans were transformed into expressions of wealth and power when incorporated into Indian dress and worn on the body as an ornament. European traders looked on in astonishment as Indians suspended iron axes around their necks, used house keys for ornaments, or hung papers of pins from their hair but without comprehension of how these had been evaluated by their new owners. (Penney 36)

Various Plains groups also provided opportunity to belong to specialized organizations, each with their own distinctive uniform. Many militaristic societies cut across division by clan or band, allowing for larger group unification. The Kiowa Black Legs society was known to have existed in 1834. Historically, the Black Legs functioned as a police force during migrations. Discontinued during the early part of this century, the Black Legs society was revived in 1958 by Gus Palmer. The society was fortunate to have the guidance of elders who remembered the traditional songs, dances and ceremonies from the 1920s. Today members wear black leggings to recreate the black paint of earlier society members, and red capes symbolic of one captured from a Mexican officer by Palmer's great grandfather (Time-Life 120-128).

There are also societies to honor the accomplishments of women. The attire of the Cheyenne Quilling society is resplendent with the embellishments of plains quill and bead artistry. As plains men grew notorious for their ability as horsemen and buffalo hunters, the women became increasingly able to help support their family through finely crafted trade goods (Penney 33-34). Guilds controlled much of the art, and apprenticeship was graded by type of item. Ceremonies were conducted to celebrate the initiation of a women to the next level. Here, a woman recounted the items that she had made (just as a warrior would recount the battles he had fought). These female societies, also, cut across band and clan divisions, although a hierarchy system may have prevailed in that the participants usually came from among the families of more notable men (Walker and Maynard: 205-209).

A strong case for the association of art with the cultural self-identification of a people can be found in the area of political protest attire. The resurgence of interest in "traditional ideologies" in the 1960s and 70s resulted in the inclusion of older symbols on clothing. Worn as an expression of solidarity and acceptance of one's "Indian-ness", these elements are viewed as statements of identity by the Indian and non-Indian alike. For Indians raised in urban communities, this often meant going back to the elders on the reservations to seek cultural educations.

At the 1973 trial of AIM members Russell Means and Dennis Banks for their participation in the siege of the Wounded Knee site, elders of the Pine Ridge reservation attended in "traditional" attire. Judge Nicols called the attorneys and defendants into chambers and demanded that the elders in "costumes" be removed from the courtroom. Attorneys for the defense explained that the attire was the equivalent of "tux and tails", worn out of respect for the proceedings. The Judge remained adamant that "white" attire should be worn in the courtroom until Severt Young Bear, interpreter for the group, said "Judge, I wouldn't talk that way if I wore a black dress to work." --Nicols thought it over, grinned and relented, allowing the elders to retain their formal attire (Means 307).

Today, the most common appearance of plains formal attire is found at powwows,[4] held across the country. Powwow serves as a communal gathering for people, and may be held for celebratory, honoring, or social purposes; many include contests where dancers compete for prize money. Pow-wow attire has undergone many innovations intended to appeal to the viewing public, creating controversy from both within and outside the native community over the use of new materials and elaboration of design.[5] Attention is paid to the importance of the visual presentation of attire; even non-participants are requested to adhere to certain standards of dress. Among native peoples, ladies include a shawl when entering the dance arena; men are expected to wear a hair ornament.

The dances of men are of earlier origin than those of women, and typically recreate historic events and stories. One of the oldest styles, the men's Grass Dance, is attributed to the Kansa, Ponca and Omaha. In the 1860s, when it was taken up by the Northern plains people, most dancers belonged to functioning societies, with rights to certain prerogatives. The Grass Dance was led by men wearing belts adorned with crow feathers; other dancers attached sweet grass to their clothing (Heath 107-9, White Eagle 1996).

In the late 18th and early 19th century the development of the dance, and its accompanying regalia, split in two directions. The Straight Dance developed among the Osage, Ponca and Pawnee through inclusion of elements of Midewewin[6] society. Straight Dance includes clothing popular among the eastern immigrants of the period: cloth shirts, ribbon trimmed bandoliers, deer-hair roaches, or hats with fur "trailer" tails. The Straight Dance attire does not include the crow feather belt, and therefor allowed for the inclusion of dancers who did not belong to formal societies. (Heath 109-10)

Alternately, the western Oklahoma tribes expanded on the use of the crow feathers, developing what eventually became a double bustle. In the 1930s men's attire included a roach or feather "crest", held on the head by a head band, necessitated by the short hair typical of the period. In the 1960s feather "bobbers" were added to increase the suggestion of movement (Heath 111). Originally this effect was achieved with the hip socket of a bird attached with sinew (Fields 96); later by a "pivoting see-saw platform holding sockets for two feathers, which bounce off rubber-band springs" (Heath 111-12). Today, this is often accomplished by using fishing swivel hooks and film cannisters (Redman 1996). As bustles became more elaborate there was a shift toward the use of purchased feathers, many dyed in brilliant colors, and new importance to the selection of color was added to design considerations (Redman 1996). Many groups faced controversy over the decision to include nylon yarn. Today the use of mylar streamers is creating a similar debate.

Historically, plains women have taken a smaller part in public dance, serving primarily as supporters from outside the dance circle. Few accounts can be found of women's dances from before the turn of the century, except in religious ceremony. Ladies Dance regalia, in the sense suggested by pow-wow competition, has an even shorter history (Heath 115). The inclusion of women in competition powwow dance dates from the late post-reservation period, when many urban women were among those returning to "traditional" ways. Interestingly, women's attire continues the trend of employing abstract design and providing indications of social status.

Dancers competing the Ladies Fancy Dance category among the Northern Cheyenne generally recreate the buckskin dress worn by those groups that had longest access to buffalo and elk hides. Reminiscent of the clothing of Cheyenne Quilling society, the dress usually includes quilled or beaded geometric trim (Henry, 1996). Among Ojibwa and Northern Plains groups, Fancy Dance attire can be composed of a silk or cotton dress with appliqued decoration, ribbon banding, or embroidered techniques. The designs are, again, in geometric shapes, although curvilinear floral designs are somewhat common among the Plains Ojibwa.

BEST COPY AVAILABLE

From the requisite shawl that is an essential component of all ladies regalia, the category of Ladies Fancy Shawl has developed (Schwei 9). One of the newest dances, beginning among the Kiowa only in the 1960s, Fancy Shawl is seen primarily as an elaboration of Ladies Fancy (Heath 110). The ensemble includes an appliqued or embroidered dress, along with an elaborately decorated shawl trimmed with a long, flowing fringe (J. Jones 1996).

The regalia of women may also express religious views, or healing and cosmological references. The Ladies Jingle Dress is attributed to the Ojibwa (Parfit 94), and is said to have come from the vision of a woman who had prayed for healing for her sick child. (White Eagle 1996, Red Crow 8). Based on earlier elk teeth or cowrie shell ornamented finery, Jingle dresses use cones made from tobacco tin lids to supply elements of movement and sound. (Jones 1996).

There are elaborate sets of prescriptions and proscriptions that accompany the creation of dance ensembles. For example, in designing a Jingle Dress, most dancers that I spoke with agree that there should not be more than 365 cones per dress; that each should be tied on with a prayer, that the design should preferably come to a women in a dream, and that even a child should design her own dress. Also, most agreed that the cones should not be purchased pre-formed, but should be rolled for the woman by a man in her family.[7] Several men noted that females in their family had sewn the abstract decorative elements of their garments.

This interplay of co-operation between men and women is indicative of the constructs on which Plains social structure is based. There is now, and has always been, a strong sense of division between the roles of the sexes; and yet, the division has always served to enable individuals to compete only in ways that are of ultimate benefit to the society as a whole. For each sex, there is a prescribed method of production that serves to signify individual status within the community. The contribution of the opposite sex is a method of unifying the individual with the family, the family to the community, and the community to the culture.

Pow-wow attire and dance are often the subject of debate. Many people earn their living from working the pow-wow circuit, providing opportunity for the potential misuse through commercialization. Missing from the public view are the pictographic designs found in early men's attire, while accouterments considered prerogatives of certain groups continue to be held in the control of those groups. Federally protected, and restricted to only certain individuals, Eagle feather remain symbolically important among the Plains groups. An eagle feather that has been found lying on the grounds of a powwow is to be guarded, but untouched until recovered with proper ceremony, by veteran dancers. All other powwow activity ceases until the feather is returned to the owner. In practical terms, this includes those with Federal authority to handle the feather; symbolically this is described as an "important and sacred tradition" (Red Crow, 1996).

As suggested by the story of the decision of the judge in the Wounded Knee case, certain forms of attire among the Plains people today are recognized as a message of ethnic solidarity by native and non-native alike. Clearly, the debate that centers on the appropriate use and display of accouterments, regalia, and design is an indication of the importance of the association to the historical past of the Plains culture. Artistic innovations are scrutinized, accepted, or rejected based on standards that reach deeply into the past and present mores of the group. Efforts to depart in the extreme from the cultural context of decoration and symbology are met with dispute. While fashion and innovation continue to influence the stylistic changes that typify Plains attire, it is clear that Plains formal clothing continues to remain a strong statement of individual identity and accomplishment, as well as a message of cultural unity.

Notes

[1] Throughout this paper I use the identification of nationality chosen by the source.

[2] Boas, Franz--1903 "The Decorative Art of the North American Indians", as quoted in A Wealth of Thought, Aldona Jonaitis. See Jonaitis also for an excellent summary and perspective of the writings of Boas, and their juxtaposition with other theories in Native American art.

[3] According to Erving Goffman, total institutions engage in re-socialization by altering personality through deliberate control of the environment. Employing techniques calculated to disrupt routine, and remove persons from their natural element. Such treatments may "institutionalize people entirely making them unsuitable for life outside of the institution." (14)

[4] The term "powwow" may have originated with the Algonquin term *pau wau*, and is a reference to a formal meeting (Parfait 91).

Victim vs. Participant: A Comparison of Dmitri Shostakovich's *Lady MacBeth of Mtsensk* and *Katerina Ismailova*

The premiere of the opera *Lady MacBeth of Mtsensk* in 1934 brought great fame and recognition to Russian composer Dmitri Shostakovich. The success of the opera gained the composer attention within the Soviet Union and throughout the Western world. In 1936, it was condemned and Shostakovich lost all his rights and his music briefly disappeared within the Soviet Union. In 1963, a revised version of *Lady MacBeth* premiered, titled as *Katerina Ismailova*. The new version contains some revisions in music and libretto and was given a new opus number. The exact reasons for the revisions remain unclear, but most evidence points towards Shostakovich's personal desire for improvement in the work as opposed to political pressure due to the 1936 condemnation.

Prior to his work on *Lady MacBeth*, Shostakovich had written his first opera, *The Nose* based on the story by Nikolai Gogol. The opera was written while Shostakovich worked as music director for the avant-garde theater director Vsevolod Meyerhold. "This opera, like so many other interpretations of Gogol made in this period satirizes Nicolaevan Russia as an emblem of all that the avant-garde of the day abhorred: oppressive regimes, a bureaucratic cast of mind and above all cultural philistinism" (Fitzpatrick, 228). Members of one of the feuding professional groups, the Russian Association of Proletarian Musicians (RAPM) harshly criticized the opera. This was the first time in which the accusation of "Formalism" was first associated with Shostakovich and one of his major works. Despite the criticism of *The Nose*, with the popularity of Shostakovich's First Symphony many Soviets took pride in the composer's accomplishments and his flourishing reputation in the West. He was, after all, a Soviet composer who had been trained in the Soviet era of the Petrograd conservatory and had the mutual experiences of the revolution with his generation.

Shostakovich began work on his second opera *Lady MacBeth of Mtsensk* in 1930. The libretto was based on a short story by 19th century Nikolai Leskov. The story concerns itself with life in rural 19th century Russia and a woman, Katerina, who is bored with her life and takes a lover. This results in the murdering of her father-in-law and husband. In his story, Leskov portrayed the life of the merchants in the provinces, their cruel and boorish lives. The effect Shostakovich wanted to portray was Katerina as a victim of her circumstances and that her only true crime was wanting a better life (Wilson, 96). There was speculation that Shostakovich planned a trilogy of operas portraying womanhood in Russia.

Shostakovich completed *Lady MacBeth* in December of 1932 and it premiered at the Leningrad Malyi Theater (MALEGOT) on January 22, 1934. A few days later a simultaneous production began at Moscow's Nemirovich-Danchenko Theater under the title *Katerina Ismailova* after the opera's heroine. Both productions received a great reception. "'A triumph of musical theater' was the heading in the newspaper *Sovietskoe iskusstvo* which devoted a page to the opera- and the musical press continued to publish analyses and commentaries on it for a whole year after its premiere" (Clark, 185).

Lady MacBeth was considered a success and secured Shostakovich's reputation "as a composer of dramatic genius both at home and abroad" (Wilson, 96). MALEGOT had given 50 performances and abroad, the opera had been staged in the USA, Argentina, Sweden and Czechoslovakia.

Popularity for *Lady MacBeth* increased so much within the first two years of production that the Bolshoi Theater staged a new production of the opera. It was a production by the Bolshoi Theater's Second Company that Stalin along with Vyacheslav Molotov and other party officials attended in January of 1936. Shostakovich was in Moscow at the time and was to remain present the event that the party members wanted to meet him. He was not summoned to meet with the officials, they had reportedly left after the first act; Shostakovich was not called to the official's box.
Two days later on January 28, Shostakovich received a crushing blow in the form of an editorial which appeared in the Russian journal *Pravda* which condemned the opera as "muddle instead of music."

The article in *Pravda* reportedly written by Politburo member and a close associate of Stalin, Andrei Zhdanov was not an attempt to deny the composer's talent but branded it as "formalist" and a

BEST COPY AVAILABLE

"Leftist distortion" of music. "'Formalist' was the code word for a composer who strayed in the direction of the modern, wicked West" (Fitzpatrick, 213). As the article stated: "All this is not due to lack of talent , or the lack of ability to depict simple and strong emotions in music. Here is music turned deliberately inside out in order that nothing will be reminiscent of classical opera... The power of good music to infect the masses has been sacrificed to a petty-bourgeois, 'formalist' attempt to create originality through cheap clowning. It is a game of clever ingenuity that may end very badly" (translated in Seroff, 204-207). However, the staging of the opera seen by Stalin is unclear and therefore, the extent of vulgarity and offensive material displayed is unknown. With the condemnation of *Lady MacBeth*, Shostakovich's membership to the Union of Composers was revoked.

Shostakovich did serve as collaborator in all three Russian productions of *Lady MacBeth* in 1934 and 1935 including MALEGOT in Leningrad and at the Nemirovich-Danchenko Theater and Bolshoi Theater's Filial in Moscow. The composer agreeably made minor musical changes and offered alternative texts and other modifications when problems appeared during rehearsal. "This was, of course, well before specifically political motives could have preoccupied him" (Fay, 162). Although there were occasional changes made throughout the opera in the 1963 version, the scene which received the most attention is the rape/seduction scene of Katerina and the hands of Sergei in Act I, Scene 3. In the original opera, Katerina is seen more as a willing participant in the sexual act than as a victim. Although the orchestration in the instrumental interlude changed the most, the words were changed to enhance the idea of Katerina as a victim.

There are significant changes in Katerina's aria in the beginning of Act I, Scene 3. The lines omitted from *Katerina Ismailova* include, "The foal runs after the filly, the tom-cat seeks the female." In the original, Katerina's description of her loneliness are in terms of not having someone to fulfill her physical needs as she states, "No one will put his hands round my waist, no one will put his lips to mine, no one will stroke my white breast, no one will tire me out with his passionate embraces." These lines are obsolete from the revised version. There is no longer Katerina's desire to fulfill sexual frustrations but to fill the void of mere companionship in the absence of her husband. In *Katerina Ismailova*, the heroine states, "I've no one who loves me, no one to love. My days pass in a cheerless bleak procession. I'll grow old, never knowing what love was. Ah! Why, ah why, should this be my fate!"

Another significant difference in the libretto occurs after Sergei's entrance in the same scene. He has come to Katerina's room in an effort to tempt her. In the libretto for *Lady MacBeth* Katerina muses that if she only had a child, she would not be bored with her life. Sergei is encouraged by Katerina's statement and adds to it by saying, "Yes, but even a child, if you'll allow me to put it like this, comes as a result of something, not just of its own accord." In the revised version it is reading that Katerina wishes for to rid her of boredom and it is Sergei alone who alludes to Katerina taking a lover. Therefore, allowing Katerina to remain in our eyes as a dutiful wife and strengthen the idea that she is a victim.

Another major change in the libretto occurs after the musical interlude in the same scene. In *Lady MacBeth* after the sexual act has occurred Katerina asks Sergei to leave, that she is a married woman. Sergei entreats her to not think of that and Katerina states, "I have no husband, but you alone." In the revised version, Katerina as a victim is more discernible. There is no mention by Katerina that she no longer has a husband, in fact she implores Sergei to remember that she is a married woman and that she has sworn an oath to her husband to remain faithful. The scene ends with Sergei calling for, "my Katya!"

In the staging of the original, the physical violence between Katerina and Sergei occurs during the instrumental interlude in front of the audience, but in *Katerina Ismailova* the physical struggle and seduction are carried out and interpreted in the imagination of the listener. Both versions do emphasize that Katerina is dragged behind a curtain and none of the action actually occurs on the bed which is in plain view of the audience.

Of the music that was changed in the revision, the music in the interlude of Act I, Scene 3 was changed the most. The most noticeable change is the absence of the trombone glissandi which enhances the idea of seduction and the sexual act and enhances the idea of primal passion between Katerina and Sergei. In *Katerina Ismailova* the interlude has a much more subdued tone, almost as if there is an attack of conscience or because Katerina's father-in-law, Boris Timofeyevich returns.

It is the "rape" interlude which because of either prudishness or a sense of political correctness was altered drastically. In the revised version, the "rape" interlude has been reduced to an illusion which occurs only for the listener. In the revised opera even the increasing musical and dramatic tension between Katerina and Sergei comes to an abrupt halt when the father-in-law reappears in the courtyard.

Even with some of the alterations made in *Katerina Ismailova* the opera was rejected by the Party in 1956 and further revisions were made. The premiere of *Katerina Ismailova* was produced by the Stanislavsky Theater and although it eventually was sanctioned by the Minister of Culture, recent occurrences surrounding Shostakovich's controversial Thirteenth Symphony gave cause to worry and

BEST COPY AVAILABLE

"for the sake of caution it was camouflaged by being billed as *The Barber of Seville*" (Wilson, 350).

Shostakovich took a very active role in productions of *Katerina Ismailova*. "The composer felt that his presence was essential to the opera's new life; for instance, he stated that he had in some measure been able to tone down exaggerations in the London and Zagreb productions, where undue emphasis had been given to the erotic element (350). He attended all the rehearsals at the Stanislavsky Theater but he took an active part in the productions in London and Riga. In Vienna, Shostakovich demanded that some proposed cuts be restored and refused to allow La Scala to use the first variant of *Lady MacBeth of Mtsensk*.

As for the comparison of the two operas, most interest in the revised version disappeared when in 1979 the original 1932 score for *Lady MacBeth* surfaced in the West. This in turn instituted as new set of productions of the "rediscovered" opera. It is assumed that the original version contains Shostakovich's first and best intentions, without any politics involved. It is the original which is now performed as opposed to *Katerina Ismailova*. "The fact that Shostakovich himself repeatedly expressed a preference for his own revised score is usually discounted; for how could the composer have been in position, even after Stalin's death, to tell the 'real' truth?" (Fay, 161). It is however the revised version which bears Shostakovich's stamp of approval.

The 1936 condemnation of *Lady MacBeth* was undoubtedly a personal blow to Shostakovich. However, the condemnation was effective in defining the stylistic policy which Soviet composers followed for the next forty years. My belief is that the revival of the opera in a revised form was not due to political pressure as much as it was a personal artistic decision by Shostakovich. The original idea that Shostakovich wished to portray was Katerina as a victim of her circumstances, not a participant in the events that would lead to her tragic end. The revised music and libretto in *Katerina Ismailova* depict Katerina more as a victim than as a participant in her seduction.

New Possibilities in Composition Through Computer Technology

Christopher Watts

Furman University
Greenville, SC 29613

Faculty Advisor:

Daniel Koppelman

Recent advances in computer music technology have provided a new and exciting set of tools for composers. This study focused on the creative manipulation of musical data using a computer-based compositional system. The greatest advantages of such a system are: 1) a great reduction in the elapsed time between artistic inspiration and auditory realization; and 2) the composer's nearly unlimited ability to manipulate musical parameters, both through the use of a graphical interface and mathematically. These processes are demonstrated through examples detailing the evolution of an original composition entitled *Samsara*.

Since the introduction of the personal computer, many fields have made use of these powerful devices, and music is no exception. Perhaps the most familiar music-related task is the notation of music for publication. However, there are many other areas in which the computer has become a useful tool. Normally, composing music is a slow and arduous process. Once the music is on paper, the appropriate musicians must be assembled to perform it, and any modifications which the composer desires to make must be done afterward. A computer can be used to work around many of the logistical problems previously associated with composition. A typical computer-based compositional system will include a computer, one or more electronic musical instruments (usually keyboard synthesizers), and an appropriate software program (called a sequencer). The instruments communicate with the computer using the Musical Instrument Digital Interface (MIDI) protocol, which specifies the data format for the exchange of digital information regarding such musical parameters as pitch (frequency; high versus low notes), dynamics (amplitude; loud versus soft), and rhythm (when sounds occur and how long they last). MIDI data is analogous to the paper roll on a player piano. It does not actually contain the sound, but it provides information to the instrument which then produces the music. The sequencer can be used to record, manipulate, and play back the data received from the MIDI instruments. The software used in this study was Vision Professional Sequencing Software by Opcode Systems.

REDUCING THE TIME BETWEEN INSPIRATION AND REALIZATION

Sequencing programs are capable of recording multiple "tracks" of MIDI data individually and then playing them all back simultaneously. This means that, for example, a composer can try out many musical ideas for a symphony without having access to an orchestra. These immediate results allow for experimentation and revision which might otherwise be very time-consuming or very costly. It should be noted that in this case the computer is not intended to replace the orchestra. Rather, the computer allows the composer more freedom to experiment and rework his composition before the parts are passed out to the orchestral players.

There are also cases where a composer may choose to write a piece of music specifically for performance by a computer system, such as the piece used in this study. This allows the composer to use timbres other than those found in traditional groups of instruments, and even to write music which is too difficult for human performers. In many of these cases, the computer system actually replaces the human performers. However, such pieces often include one or more parts intended for live performance. Pieces which include both live performance and computer-generated elements have become popular in recent years.

The advantages mentioned above would be lost if the program were not easy to use. For this reason, most sequencing software programs use an intuitive tape recorder style format for basic record and playback functions.

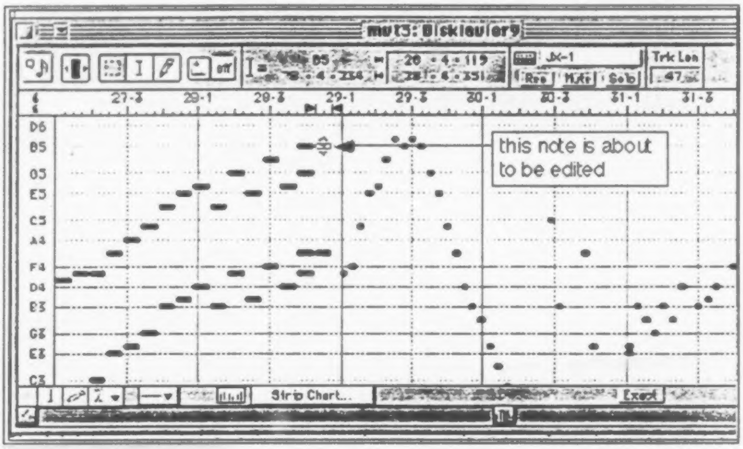
MANIPULATING MUSICAL PARAMETERS

Sequencing programs can be used for simple recording and playing of musical excerpts. However, the real advantage of such programs lies in their great flexibility in the area of data manipulation. Because all of the information used in a sequencing program is in a digital format, any number of musical parameters can be individually altered without disturbing other aspects of the music. The most commonly edited parameters include pitch, rhythm, and timbre (tone color; e.g. a clarinet as opposed to a trumpet).

Editing Parameters Graphically

If a part is played incorrectly during recording, wrong notes can be corrected in the sequencing program with the mouse. Furthermore, as the composer revises his work, changes can be made without the re-recording the part. Simply changing a note on the screen with the mouse will cause the playback to be changed.



this note is about to be edited

Figure 2: Individual pitches or rhythms can be easily altered with the mouse.

Figure 2 shows the edit window, where the music can be edited graphically. Time is shown on the x axis, while pitch is shown on the y axis. Since the data is all digitally recorded (and represents instructions rather than sound), changing the pitch of an individual note will not affect any other parameters of the performance (for instance, raising the pitch will not cause the playback to speed up).

BEST COPY AVAILABLE

Rhythm is another parameter which can easily be edited graphically. As in the pitch domain, if a rhythm is played incorrectly during recording, or if the composer decides to change the rhythm as the piece is revised, this can be accomplished by dragging notes on the screen. Another practical use for the graphic editing of rhythm is augmentation or diminution, compositional processes which have been common since the Eighteenth Century. Augmentation and Diminution involve the proportional increasing or decreasing (respectively) of the time values of all the notes of a theme or motive. Graphic editing provides a simple way to use these techniques. Again, because of the digital format used, changes do not affect any other parameters of the music. Changing the rhythm will not cause the pitch to be altered.

A third parameter which is easily edited graphically is timbre. If the composer decides to change his orchestration, altering what is called "program change" or "patch" data will cause the part to be played back on a different instrument and/or a different sound.

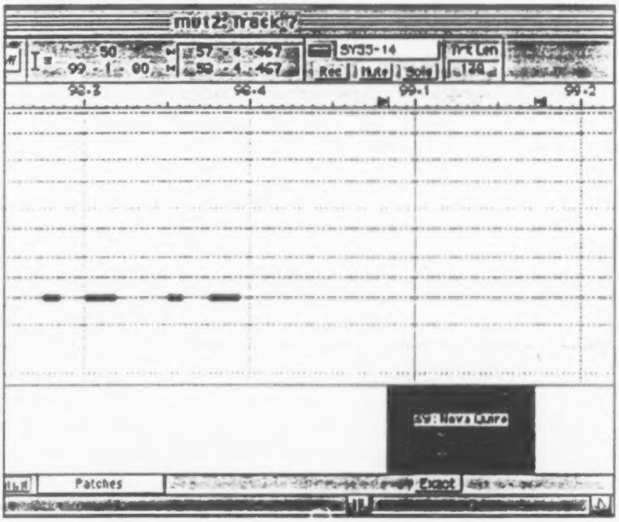


Figure 3: This "program change" will instruct the instrument to switch to a new sound, or "patch" ("NovaQuire" is the patch name in this case).

Editing parameters graphically has many advantages. It is an easy and intuitive process. Furthermore, all changes that are made can easily be undone; a fact which encourages experimentation while removing some of the inherent risk.

Manipulating Parameters Mathematically

In contrast to the graphical interface, parameters can also be dealt with in a mathematical format. Figure 4 illustrates a "list window," where data specifying events is listed in chronological order. In this format, the data is more precise and more complete than in the graphic edit window. Events are listed at their precise moment in time, and data which may not be shown in the graphic edit window is displayed. In this window, editing can be done by selecting the appropriate parameter and typing in a new value. This is the most simple type of mathematical manipulation. More complex mathematical manipulation has opened up some of the most exciting new possibilities. It has allowed composers to develop material in ways that were previously impossible. For example, Figure 5 shows eight individual parts. The lower six parts are all mathematically derived from the upper two parts. This was primarily done by selecting small portions of the original part and pasting them over longer or shorter amounts of time. This can easily be done with the "Scale Time" function shown in Figure 6. Many of the newly created passages are also transposed to a new pitch level, and some of them are backwards. The result is a passage that is "organic" in construction, meaning that all of the various parts are closely related to one another, but in a way that is too complex to be obvious. Since all

of the individual lines are so closely related, there is a real sense of cohesiveness within the passage. This idea of "organic construction" is certainly not a new one. Composers such as Philippe de Vitry and Guillaume de Machaut used this idea in the isorhythmic motets of the Fourteenth Century (Stolba 118). However, it has never before been possible to use it at this level of complexity.

CONCLUSION

Computer-based compositional systems have provided a number of new possibilities for musical composition. A reduction in time between an inspired idea and its realization allows for more experimentation and revision. The ability to simulate any number of performers eliminates many logistical considerations. Revision and experimentation are further facilitated by the computer system's powerful data manipulation capabilities. As computer systems continue to become more powerful, these capabilities and their implementation will expand as well. Recent improvements have allowed for the manipulation of digital audio files in the many of the same ways that MIDI data can be manipulated (Basserman 70). As computers become more "interactive," the possibilities continue to increase. Tod Machover, a professor at the MIT Media Lab, is currently touring with a production of his called the Brain Opera. It is a computer generated composition that is affected by audience participation! (Wilkinson 26) As this technology continues to improve, these tools, placed in the hands of talented composers, will allow for even more creative expression. Perhaps eventually the technology will become completely transparent; so powerful and intuitive that the composer will not be impeded at all by the complexities of such systems.

The Conception of "Poet" In The Work of Bei Dao

Jennifer L. Berry

Martin Backstrom

Bei Dao has been a leading figure of the Chinese Literary scene for over 20 years and has lived in exile since 1989. While his poetry of dissent is officially suppressed in China, it has nevertheless been extremely influential. This investigation focuses on Bei Dao's convictions regarding his own craft and the role of the poet. Bei Dao never directly defines what he believes the role of the poet should be. However, it will be shown that he does define what the role of the poet should be through reversal, a criticism of what a poet should not be. The details in Bei Dao's criticisms reveal his convictions regarding the role of poetry in society, the poet's responsibility as a poet, and the poet's ultimate responsibility as a human being. Bei Dao believes that a poet must write originally, personally, and subtly. He or she must be strong and humble in order to remain true to the self and to reality.

Poetry has traditionally been one of the most important means of expression in China. It has a written history of over 2,500 years and verbal tradition going back even further. Originally Chinese poetry was a very expressive art form. Over time it became a codified system of the upper classes, serving as the format of civil service examinations. The original spirit of Chinese poetry has been resurrected by modern mainland poets who focus on self expression and political expression. Modern Chinese poets draw inspiration from both traditional and western sources.

Bei Dao was born in 1949, the year of the birth of People's Republic of China. His education was suspended in 1966, at age 16, with onset of the Cultural Revolution. Like his fellow classmates, he became a Red Guard, but soon became disillusioned as the tyranny of the old was replaced by the tyranny of the new. Bei Dao began to educate himself and began writing poetry in 1970, at the age of 20. In 1978 he co-founded *Today*, an underground literary journal which had great influence on poets of his generation. His work was rarely seen in official publications. In the late 1980's he was allowed to obtain a passport to attend conferences and be a gust of foreign universities as a visiting scholar. During the 1989 Tiananmen Square Protest, while Bei Dao was in Berlin, student protesters re-published his most famous poems in student newspapers and featured lines from his poetry on protest banners. After the massacre on June 3-4 1989, Bei Dao was not allowed to return to China. He has lived in exile in Europe and the USA ever since. His wife, the artist Shao Fei, and daughter have not been allowed to leave China to join him.

In his poetry Bei Dao never directly defines what he believes the role of the poet should be. This, however, does not mean he never reveals his conception of the role of the poet and of poetry. Bei Dao tells us what the role of the poet should be through a reversal, a criticism of what a poet and poetry should not be. "The Artist's Life," and "Portrait of a Young Poet," both written between 1979 and 1983 (Bei Dao is not concerned with precise dating), are caustic criticisms of what a poet should not be and should not do. In this manner, he defines what a poet should be. "The Artist' Life" tells the story of a poet who degenerates by giving into governmental policy after being reprimanded for dealing with the truth and questioning the system. "Portrait of a Young Poet" is the ugly picture of a poet who has already given into the government long ago. [While both poems are about poets, to avoid confusion I will refer to the poet in "The Artist's Life" as 'the artist,' and the poet in "Portrait of a Young Poet" as 'the poet.' Anytime I refer to 'a poet,' I mean a poet in the abstract sense.]

At the beginning of "The Artist's Life," Bei Dao notes the four choices available to a poet in China. These are: to write about the mundane:

> go and buy a radish
> —mother said

To write on officially approved topics in officially approved modes:

hey, mind the safety line
—the cop said

To stop writing all together and retreat into a self destructive refuge:

ocean where are you
—the drunk said

Or, rather than ignoring the problems of China as these approaches do, to deal with reality:

why have all the street lights exploded
—I said

The last option, which asks the question 'what's wrong here?' is the one a poet should choose, and indeed is the option the artist does choose until the state exerts it's force and he or she recants to safety of option two. Dealing with the reality of contemporary China carries the risk of government persecution. The artist cracks under this pressure and turns into an evil, unfulfilled person who forces others to also conform to governmental standards. Bei Dao's criticism in the description of this conversion shows his belief that Chinese poets must deal with contemporary reality. In order to stay viable, current and critical, poets must be morally strong and humble. Their poetry must be subtle, original and be founded on a standard of quality.

Bei Dao believes poets need to be morally strong, unable to be coerced, bought out, or otherwise corrupted. They must be true to themselves. His sardonic description of the artist who does the opposite shows the spite Bei Dao feels to those who sell out. The artist sells out to the system:

and so I became a model patient
sneezing loud and clear
closing my eyes to figure out the mealtimes

In becoming a model poet, who like a model patient is very much like a zombie, and forcefully spewing forth poetry which is obvious ("loud and clear") in it's adherence to governmental policy, the artist internalizes the governmental programs and gives up his or her own beliefs. Now the artist no longer needs outside reminders to keep with the program, just as a patient who internalizes a hospital program no longer needs a clock to figure out when it is time to eat. This process culminates with the artist being "taken on as a doctor too." The artist becomes a government official with, one suspects, all the perks.

During this process of selling out the artist has given his or her talent and life away to the bloodsucking government:

donating blood to the bedbugs
with no time to sigh

By internalizing the government program, the artist has not only lost him or herself, but also the time and even the ability to see what is really going on in the world. Allowing one's life to be sucked away is too consuming and tiring to even sigh. Left with nothing, the artist resorts to pacing:

. . . up and down the corridor
to while the evenings away

Ultimately a poet who sells out is a pitiful sight. But the greatest problem with selling out, with doing what the authorities want loudly, vigorously and obviously, is that one ends up enforcing those values in others also—either through intimidation of persecution, or through actual persecution itself:

holding a thick hypodermic
I pace up and down in the corridor
to while the evenings away

Pacing with the hypodermic is intimidation, actually using it, however, is persecution. For poets who sell out, Bei Dao notes, there is no chance to see the current reality of China. Such poets become used to the lies they spew and blind to what is going on around them. All they can do is persecute and incriminate others who are free of the system and still see reality, just as the artist was originally incriminated for asking what was wrong with China:

why have all the street lights exploded
—I said

a blind man passing by
nimbly raised his cane

and pointed out the artist as the one to be taken away. Dupes of the government, those who are blind, become so used or the darkness of the regime that when anyone questions it they convict that person, having become adept at pointing out anyone who doesn't fall into party line. For these people, the ability to see actual reality is irrelevant once they have taken on the government's program of reality. The artist has come full circle, from being the persecuted, to being the persecutor.

In "Portrait of a Young Poet," Bei Dao criticizes the poet in a similarly harsh manner, for selling out and for continuing to repetitiously write the same old things the government wants, just to get money:

. . . you
don't mind repetition
saying again that money isn't clean
but everyone is pretty keen on it

or just to get drugs, which support the weak nature which resulted in the poet selling out in the first place:

thanks to a poor constitution, you
have to swallow several hormone pills a day
making your voice as tender
as the cat next door in heat

The poet is weak and the drugs are the government payoff which result in his writing of poetry in the approved style. This writing (the poet's "voice") in the approved style is necessarily unsubtle, obvious, and obnoxious. Corruption seems acceptable as the poet convinces himself that everyone else is also "pretty keen" on money, and that all the other poets are just as corrupt and stink like him, "skunks, all of us."

But corruption doesn't pay. The poet loses that which is necessary to life itself—truth to self—and in so doing comes closer and closer to death. Worse yet, he can't even tell he is in the process of dying:

the weather is mortally cold; blood
darkens, numb
is the night
like a frost bitten toe . . .

The poet is freezing to death, selling out has rendered him so out of touch with himself, so cold that is, that he can't even feel when it is overtaking him. He doesn't realize he has lost that which he needs to survive (blood darkens as it loses oxygen, without oxygenated blood, one dies). There is no escape after selling out to and becoming a part of the system. The poet has become crippled, and couldn't even stand up for himself if he wanted to:

. . . you
limp
in and out of the brake beside the road
meeting laurel-wreathed louts

He staggers in and out of his dealings with the government (the brake[*]), and it's officials (the laurel-wreathed louts), too weak to hold himself up against them. The young poet has aged rapidly since giving in to the wishes of the government: becoming bald, losing teeth, and gaining a limp. He is feeble and, like the artist who also sold out, practically dead.

The poet is anything but humble. Bei Dao describes him as enervated and childlike with creeping ambition:

. . . ambition grows as ever
around the edges of your baldness
taking out your false teeth, you look even more childish

The poet is, in fact, so desperate to have his name known that:

as soon as one's back is turned you scribble your name
on a public lavatory wall

---

[*] rough or marshy land overgrown with one type of plant (Webster's New International Dictionary, 3d ed., s.v. "brake.")

He is an ambitious immodest man who is all the more wretched for it. The artist lost any humility when he or she achieved stature by becoming a part of the system. Both the artist and the poet end up as contemptible and ugly human beings.

Bei Dao believes that poetry must be subtle. He criticizes the poet for writing from that which is outwardly obvious, "the inspiration drawn from your sleeve ." The poet's voice isn't subtle or nuanced, it's obvious, harsh and wailing, like a cat in heat. His poems are sneezed out, fast, messily and without care onto the page. The artist also sneezed his or her poems, writing loudly and obviously, without any subtlety. By describing the poetry as sneezed, Bei Dao says poetry which is not subtle is quite simply, waste.

Bei Dao believes poetry must be original and personal. Indeed, the non original 'safe' subject matter can never be subtle, it must be forcefully obvious, "sneezed loud and clear." Furthermore, poets who write to government standards can only create propaganda designed to numb the people, as the artist does, pacing with the hypodermic. Bei Dao feels a poet should never simply write what the government wants. The poet's governmentally approved poems are simply strung-out, obvious, trite old lines:

> The inspiration drawn from your sleeve
> is never-ending; you
> pass day and night through strung-out lines and
> lanes. . .

He only writes about subject matter which he thinks is safe:

> the moon which has paid it s insurance premium
> or the ponderously heavy
> axe which hasn't

In other words, he either writes about traditional worn images such as the moon, or in praise of the government (the axe). The poet and the artist who only sneeze the outward poetry the government wants are described throughout both poems as pathetic human beings. But Bei Dao warns, not only are they pathetic, they are mislead. The poet who tries to play it safe never can: the government, which "weighs more than thought" is not safe; governmental policy changes at whim, and anything written in support of the government today can be taken as counter revolutionary tomorrow.

The poet is subject to constant reminders of the program to which he has committed himself. From the fire engine which "wails insanely" to the government agents everywhere he turns (the owls watching in every tree), he is reminded to stick to the current party line. But even worse are the reminders from people he knew in his past, reminders of his life before becoming a government dupe. The poet assuages his guilt by choosing to believe all the other poets of his generation have also given up their previous ideals and standards, and have sold out, too.

The measure of poetry should be should be a standard of quality, not quantity, according to Bei Dao. The poet spews forth poems in never ending quantities, regardless of their quality. He pours out "never-ending" lines, but they are "strung out," tired and trite. He writes prolifically, but that doesn't mean he takes time or care with his work:

> nine sneezes in a row
> drop on paper, you
> don't mind repetition

Each poem only says the same old thing and is merely sneezed out waste. Quantity does not necessarily mean anything.

Through his criticisms in "The Artist's Life" and "Portrait of a Young Poet," Bei Dao notes what he believes a poet should do as a person and in poetry. As a person a poet must be strong and humble. A poet must write subtly, originally and personally, to a standard of quality not quantity. To be viable, current and critical, as Bei Dao suggests a poet must be, requires being present as a human being to the surrounding environment and to oneself.

The Artist's Life

go and buy a radish
—mother said
hey, mind the safety line
—the cop said
ocean, where are you
—the drunk said
why have all the streetlights exploded
—I said
a blind man passing by
nimbly raised his cane
like pulling out an antenna
an ambulance arriving with a screech
took me to hospital

and so I became a model patient
sneezing loud and clear
closing my eyes to figure out the mealtimes
donating blood to the bedbugs
with no time to sigh
in the end I was taken on as a doctor too
holding a thick hypodermic
I pace up and down the corridor
to while the evenings away

Portrait of a Young Poet

The inspiration you draw from your sleeve
is never-ending; you
pass day and night through strung-out lines and
lanes; you
were old when you were born
even though ambition grows as ever
around the edges of your baldness
taking out false teeth, you
look even more childish
as soon as one's back is turned you scribble your name
on a public lavatory wall
thanks to a poor constitution, you
have to swallow several hormone pills a day
making your voice as tender
as the cat next door on heat
nine sneezes in a row
drop on paper, you don't mind repetition
saying again that money isn't clean
but everyone is pretty keen on it
a fire engine wails insanely
reminding you to praise
the moon which has paid its insurance premium
or praise the ponderously heavy
axe which hasn't
the axe which weighs more than thought
the weather is mortally cold; blood
darkens, numb
is the night
like a frost bitten toe, you
limp
in and out of the brake beside the road
meeting laurel-wreathed louts
every tree
with its own owl
running into people you know is a pain
how they do like to bring up the past
the past, yes, you and me
skunks, all of us

Bei Dao's Poet

After the massacre on June 3-4 1989, Bei Dao was not allowed to return to China. He has lived in exile in Europe and the USA ever since. His wife and daughter have not been allowed to leave China to join him.

In his poetry Bei Dao never directly defines what he believes the role of the poet should be. This, however, does not mean he never reveals his conception of the role of the poet and of poetry. Bei Dao tells us what the role of the poet should be through a reversal, a criticism of what a poet and poetry should not be. "The Artist's Life," and "Portrait of a Young Poet," both written between 1979 and 1983 (Bei Dao is not concerned with precise dating), are caustic criticisms of what a poet should not be and should not do. In this manner, he defines what a poet should be. "The Artist' Life" tells the story of a poet who degenerates by giving into governmental policy after being reprimanded for dealing with the truth and questioning the system. "Portrait of a Young Poet" is the ugly picture of a poet who has already given into the government long ago. [While both poems are about poets, to avoid confusion I will refer to the poet in "The Artist's Life" as 'the artist,' and the poet in "Portrait of a Young Poet" as 'the poet.' Anytime I refer to 'a poet,' I mean a poet in the abstract sense.]

At the beginning of "The Artist's Life," Bei Dao notes the four choices available to a poet in China. These are: to write about the mundane:

> go and buy a radish
> —mother said

97

To write on officially approved topics in officially approved modes:

> hey, mind the safety line
> —the cop said

To stop writing all together and retreat into a self destructive refuge:

> ocean where are you
> —the drunk said

Or, rather than ignoring the problems of China as these approaches do, to deal with reality:

> why have all the street lights exploded
> —I said

The last option, which asks the question 'what's wrong here?' is the one a poet should choose, and indeed is the option the artist does choose until the state exerts it's force and he or she recants to safety of option two. Dealing with the reality of contemporary China carries the risk of government persecution. The artist cracks under this pressure and turns into an evil, unfulfilled person who forces others to also conform to governmental standards. Bei Dao's criticism in the description of this conversion shows his belief that Chinese poets must deal with contemporary reality. In order to stay viable, current and critical, poets must be morally strong and humble. Their poetry must be subtle, original and be founded on a standard of quality.

Bei Dao believes poets need to be morally strong, unable to be coerced, bought out, or otherwise corrupted. They must be true to themselves. His sardonic description of the artist who does the opposite shows the spite Bei Dao feels to those who sell out. The artist sells out to the system:

> and so I became a model patient
> sneezing loud and clear
> closing my eyes to figure out the mealtimes

In becoming a model poet, who like a model patient is very much like a zombie, and forcefully spewing forth poetry which is obvious ("loud and clear") in it's adherence to governmental policy, the artist internalizes the governmental programs and gives up his or her own beliefs. Now the artist no longer needs outside reminders to keep with the program, just as a patient who internalizes a hospital program no longer needs a clock to figure out when it is time to eat. This process culminates with the artist being "taken on as a doctor too." The artist becomes a government official with, one suspects, all the perks.

During this process of selling out the artist has given his or her talent and life away to the bloodsucking government:

> donating blood to the bedbugs
> with no time to sigh

By internalizing the government program, the artist has not only lost him or herself, but also the time and even the ability to see what is really going on in the world. Allowing one's life to be sucked away is too consuming and tiring to even sigh. Left with nothing, the artist resorts to pacing:

> . . . up and down the corridor
> to while the evenings away

Ultimately a poet who sells out is a pitiful sight. But the greatest problem with selling out, with doing what the authorities want loudly, vigorously and obviously, is that one ends up enforcing those values in others also—either through intimidation of persecution, or through actual persecution itself:

> holding a thick hypodermic
> I pace up and down in the corridor
> to while the evenings away

Pacing with the hypodermic is intimidation, actually using it, however, is persecution. For poets who sell out, Bei Dao notes, there is no chance to see the current reality of China. Such poets become used to the lies they spew and blind to what is going on around them. All they can do is persecute and incriminate others who are free of the system and still see reality, just as the artist was originally incriminated for asking what was wrong with China:

why have all the street lights exploded
—I said
a blind man passing by
nimbly raised his cane

and pointed out the artist as the one to be taken away. Dupes of the government, those who are blind, become so used or the darkness of the regime that when anyone questions it they convict that person, having become adept at pointing out anyone who doesn't fall into party line. For these people, the ability to see actual reality is irrelevant once they have taken on the government's program of reality. The artist has come full circle, from being the persecuted, to being the persecutor.

In "Portrait of a Young Poet," Bei Dao criticizes the poet in a similarly harsh manner, for selling out and for continuing to repetitiously write the same old things the government wants, just to get money:

. . . you
don't mind repetition
saying again that money isn't clean
but everyone is pretty keen on it

or just to get drugs, which support the weak nature which resulted in the poet selling out in the first place:

thanks to a poor constitution, you
have to swallow several hormone pills a day
making your voice as tender
as the cat next door in heat

The poet is weak and the drugs are the government payoff which result in his writing of poetry in the approved style. This writing (the poet's "voice") in the approved style is necessarily unsubtle, obvious, and obnoxious. Corruption seems acceptable as the poet convinces himself that everyone else is also "pretty keen" on money, and that all the other poets are just as corrupt and stink like him, "skunks, all of us."

But corruption doesn't pay. The poet loses that which is necessary to life itself—truth to self—and in so doing comes closer and closer to death. Worse yet, he can't even tell he is in the process of dying:

the weather is mortally cold; blood
darkens, numb

taking out false teeth, you
look even more childish
as soon as one's back is turned you scribble your name
on a public lavatory wall
thanks to a poor constitution, you
have to swallow several hormone pills a day
making your voice as tender
as the cat next door on heat
nine sneezes in a row
drop on paper, you don't mind repetition
saying again that money isn't clean
but everyone is pretty keen on it
a fire engine wails insanely
reminding you to praise
the moon which has paid it's insurance premium
or praise the ponderously heavy
axe which hasn't
the axe which weighs more than thought
the weather is mortally cold, blood
darkens; numb
is the night
like a frost bitten toe, you
limp
in and out of the brake beside the road
meeting laurel-wreathed louts
every tree
with it's own owl
running into people you know is a pain
how they do like to bring up the past
the past, yes, you and me
skunks, all of us

"There Is No Loneliness Like Theirs": James Wright's "A Blessing" and C.K. Williams' "On Learning of a Friend's Illness" Examined

Dr. William Aarnes

"On Learning of A Friend's Illness," by C.K. Williams was published in his 1983 collection of poetry *Tar*. It recalls a journey outside the city into a barren field that is now a sanctuary for tired old horses. Anyone familiar with James Wright's often anthologized "A Blessing" can easily recognize in "On Learning" an attempt on the part of Williams' to recreate the events of Wright's poem. In fact, the similarities are so evident that one could easily see the parallels between the two poems. Yet, perhaps for those who do not immediately recall Wright's poem, C.K. Williams does make an indirect reference to "A Blessing," by dedicating his poem to the late James Wright, who had died in 1980. By having "On Learning" borrow from and, in many ways, reenact "A Blessing, Williams undoubtedly seeks to honor Wright. However, Williams' bleak, grim poem not only shows appreciation for Wright but also criticizes the optimism expressed in "A Blessing." Williams further complicates his poem by suggesting that he finds himself lacking by failing to share Wright's optimism.

Of James Wright and *The Branch Will Not Break*, the volume of poetry in which Wright's "A Blessing" appears, critic Peter Stitt writes;

> The basic strategy Wright employs in *The Branch Will Not Break* is that of a quest. In his search for happiness, for comfort, for consolation, and for sustenance, the poet turns from the city to the country, from society, to nature, from human beings to animals, and from a fear of the finality of death to a trust in immorality. (Stitt 145)

"A Blessing" enacts such a quest and results in the discovery that appears as the central idea in "A Blessing." The quest ends as the title suggests, in a religious experience: "Suddenly I realize/ That if I stepped out of my body I would break/ Into blossom." In these lines, Wright expresses what Stitt calls and "intimate kinship" with nature, a kinship that is felt in the possibility of metamorphosis; of man and nature blending together. What seems to emphasize Wright's optimism is a belief in the possibility that a human can somehow become a flower; that somehow, the distinctions between things can break down.

Early on in "A Blessing," Wright seems to establish the possibility of interchange between substances. He sets the poem in a spring twilight, which he states "bounds softly forth." Wright allows the twilight to "bound," an action usually attributed to deer or ponies. He further blurs lines of distinction when he tells readers that the ponies' eyes "darken with kindness," thus giving them an attribute of the twilight. This melding of nature and beast establishes a suggestion of oneness that anticipates his final epiphany.

In contrast, Williams writes of a similar situation, but despite Williams' efforts at reenacting those actions reported by Wright in "A Blessing," Williams realizes that, at least to his sensibilities, all things are not interchangeable, even if they appear to be so. In the opening lines of "On Learning," Williams describes a scene where everything *looks* the same. Everything appears gray: "The morning is so gray that the grass is gray and the side of the white horse grazing /is as gray and hard as the harsh, insistent wind gnawing the iron surface of the river . . . ." Yet, despite appearances, Williams goes on to show that these elements are, in fact, not interchangeable, and he is so determined to eliminate the idea of metamorphosis, that by the end of the poem, he has destroyed the possibility of anything breaking into blossom. In fact, in Williams, the oneness that makes "A Blessing" so attractive has become grim. Instead of the possible change that leads to blossoming in "A Blessing" we find that the change in "On Learning" leads only to deterioration and decay.

The contrasts between the two settings of the poems make clear that Williams is calling into question Wright's optimism in "A Blessing." Instead of depicting a warm spring evening in the countryside, Williams takes us to a bitter cold winter morning just outside a large, urban city. What is willows in a field in "A Blessing" becomes a "brushy hollow" in "On Learning." The barbed wire that Wright quickly moves past in "A Blessing" would easily fit within the lines of "On Learning," for, as readers, we have gone from a rural, country garden of Eden to an urban wasteland composed of "scruffy fields[and] scattered pines and stands of third-growth oak...." Though "On Learning" is a reenactment of "A Blessing," the setting has changed. It is no longer what it used to be when first detailed in "A Blessing." In fact, the scene in "On Learning" is so desolate that the speaker sees urban industrialization as more attractive than the nature surrounding it. For "far off on the other shore, the eruptions from the city seem for once more docile and benign /than the cover of nearly indistinguishable clouds they unfurl to insinuate themselves among." Ugliness, only brought up briefly in the barbed wire and then quickly dismissed in "A Blessing," is a focus in "On Learning."

However, it is not only the landscape that has changed from "A Blessing" to "On Learning." The horses have changed as well. The Indian ponies of "A Blessing" have been replaced by old, shaggy, unkempt horses. Wright compares the two ponies in "A Blessing" to both swans and the delicacy of a young girl's skin, again blurring lines of distinction. However, in "On Learning," there is little delicacy about the horses, and the only thing graceful about them is their flight when the speaker scares them. These horses are old, raggedy beasts, who are "wild-eyed, shaggy, unkempt mares," whose "necks, rumps, withers, even faces [are] begrimed with patches of the gluey, alluvial mud."

In addition to the transformation of the horses from "A Blessing" to "On Learning," the relationships that exist between the animals and the speakers have altered. In the Wright poem, the two Indian ponies have eyes that "darken with kindness," and the speaker tells us "They have come gladly out of the willows /To welcome my friend and me."

Moreover, the speaker states that these two ponies "can hardly contain their happiness /That we have come." It seems by this description that the ponies were expecting their visitors, almost wondering what had taken them so long to arrive. But in "On Learning," the speaker is obviously not expected, nor welcome, but instead viewed as a threat to the herd. The speaker tells us that he startles the herd as he approaches: "All of them at once, their nostrils flared, their tails flung up over their backs like flags, /are suddenly in flight, plunging and shoving along the narrow furrow of the flood ditch, /bursting from its mouth, charging headlong towards the wires at the pastures end...." They are animals who are "reverting" and "becoming less and less approachable, more and more the symbols of themselves."

In "A Blessing," the horses are more than "approachable." Wright tells readers that his reaction to the two ponies makes him want to

> ...hold the slenderer one in my arms,
> For she has walked over to me
> And nuzzled my left hand.
> She is black and white,
> Her mane falls on her forehead,
> And the light breeze moves me to caress her long ear . . . .

This interaction between horse and man has clearly been initiated by the horse, and it is this exchange that leads, along with the light breeze, to the speaker to his epiphany. However, the speaker of "On Learning" does not have such an experience; rather, it is he who has to initiate the contact with the one horse that does not flee, and then it is not the beautiful, respectful, and enlightening exchange that is seen in "A Blessing." Instead, the speaker tells us, "I slip up on her, hook her narrow neck, haul her to me, hold her for a moment, let her go." The result of this action brings him not to a revelation, but instead to a further questioning. There is no joyful epiphany for the speaker of Williams' poem.

Instead of an ecstatic revelation of the possibility of metamorphosis, the interaction between Williams and the horses brings him only to a questioning of himself that leads to further despair. "I can hardly remember any more what there ever was out here that keeps me coming back /to watch the land be amputated by freeways and developments, and the mares, in their sanctuary . . . ." The possibility of epiphany seems gone, and in its place is a piece of the horses' manure that the speaker picks up and watches as "it crumbles in my hand, its weightless, wingless filaments taken form me by the wind and strewn /in a long, surprising arc that wavers once then seems to burst into a rain of dust."

All of these contrasts between "A Blessing" and "On Learning" give the sense that, despite the dedication to Wright, Williams actually is -- determined to call into question Wright's optimism. However, Williams is not the only poet to question Wright. Robert Bly has also recognized that Wright has a tendency to soften reality and make it more appealing and inviting than it really is. Bly complains of Wright's tendency to beautify what he sees:

> If we begin to pay attention to the faults in James Wright's work, we find that we are constantly aware of a kind of softness. In the early poetry, the softness is a vague, romantic

> mist that wraps everything. From the beginning his tendency has always been to make his own experience more literary than it really is . . . . [I]t is difficult for Wright to actually live in the present. He sees himself surrounded by a world so entirely hostile that writing poetry becomes for him at times a sort of step sideways into another dimension-- the dimension of beauty, rather than wrestling with ugliness. (Bly 112-113)

Wright's "step sideways" is what informs "A Blessing." The barbed wire disappears, and the result is a "vague, romantic mist" that allows ponies to behave as if they are twilight, the twilight to behave as if it were an animal, and this sidestep is what allows Wright himself to be transformed into a flower. This mist is what Wright expresses in "A Blessing," and it is also what is absent in "On Learning."

It is Williams who does not "step sideways." Instead, he echoes Bly's criticism by seeming to revel in "wrestling with ugliness." When he attempts to reenact Wright's "blessed" journey off the highway, Williams finds himself in despair in a desolate landscape. He finds no epiphanies; instead he finds

> No comfort here, nothing to say, to try to say, nothing for
> anyone. I start the long trek back,
> the horses nowhere to be seen, the old one plodding wearily
> away to join them,
> the river, bitter to look at, and the passionless earth, and the
> grasses rushing ceaselessly into place.

But, if Williams is being critical of Wright's "literary softness," "On Learning" is a less attractive poem than "A Blessing" for lacking that poem's beauty. Whereas Wright's poem strives to gloss over the negative and less attractive elements of life, Williams' poem, by striving to include them, lacks any traces of softness and delicacy that give Wright's poem its charm. There is no kindness or love or happiness in Williams' work, only barrenness and despair. The love that existed between the two Indian ponies in "A Blessing" has disappeared entirely in "On Learning." Wright has a friend along with him, and the ponies he encounters are in love. The happiness of his encounter ends in an exhilaration the reader wants to embrace. Williams, on the other hand, does not have a companion, and the old mare that he does encounter does not come to him voluntarily. Their meeting is anything but happy and affectionate. It is simply a lonely encounter in an ugly landscape.

Williams has clearly found the loneliness through his reenactment of "A Blessing"; however, it is not the loneliness he was looking for. While Williams may not agree with Wright's optimism, Williams longs for it. He does not want the emptiness that he has found; instead, he wants the loneliness Wright speaks of-- a loneliness that exists between kindred. Williams states that he "hardly can remember anymore what there ever was out here that keeps me coming back;" yet it is clear that, no matter how foggy the memory, he does indeed remember. Why else the dedication to Wright and why else the attempt to experience what Wright outlines in "A Blessing"? Williams' desire for something other than what he finds is notably suggested when the manure he throws into the air bursts into a "*rain* of dust" [emphasis mine]. This hint of a transformation of refuse into rain-- a life-bringing element which is noticeably absent from "On Learning"-- suggests Williams longing for what Wright seems to have found in "A Blessing." What Wright values so much in "A Blessing" is the darkness and naturalness of the two ponies and their setting. Even more he values their love-- a love, he tells his readers, that creates a transforming loneliness. And Williams, despite his criticism and skepticism, seems to value this too, and, despite faulting Wright for his lack of realness, nonetheless wishes to share the blessing that Wright has had.

Embrace of Dionysus
The Presence of African Art
In D.H. Lawrence's Women in Love

Eric Chandler

D.H. Lawrence's novel Women in Love can be seen as a commentary on the degeneration of a man's soul through an embrace of the wholly primitive or the wholly civilized. This embrace blocks out the ability of man to achieve self-realization or maintain a healthy relationship with another human being. Lawrence's extensive reading on primitive cultures, his exposure to African art, and his selective disgust for the trappings of European civilization all manifest themselves in this novel. From these influences, Lawrence portrays the struggle men and women endure to find love with another. This love, however, is won or lost under extreme duress due to the internal struggle these individuals encounter as they try to decide between following the primitive, internal yearnings of their soul or the civilized sensibility of their society.

The characters of Women in Love represent a dichotomy of personalities much like the Apollonian and Dionysian states of consciousness found in Friedrich Nietzsche's The Birth of Tragedy. Externally, the characters represent an "Apollonian consciousness." Apollo, described by Nietzsche as "lucent", with eyes like the sun (1872) embodies the "enlightened" and civilized sensibility of the characters. This is Gerald Crich in Women in Love. He is associated with sobriety, intellectual knowledge, industry, and a European or Caucasian heritage; a Dionysian reflects "the primitive", drunkenness, sensual knowledge, nature, darkness, and the exotic or African. Rupert Birkin, although of a European heritage, sees the need for the presence of the Dionysian in Apollonian life at the beginning of the novel. Nietzsche sees the conflict erupt when the characters realize "with a shudder...that [their] Apollonian consciousness was but a thin veiling hiding them from the whole Dionysian realm" (1872). This realization can lead to either life or death, as the relationships in the novel reveal.

In the chapters "Fetish" and "Creme de Menthe", Lawrence uses African art to show the appreciation Rupert has for the sculpture and the contempt in which Gerald holds it. The sculpture they view is a fertility fetish from the Yoruban tribe of West Africa. This particular type of sculpture emphasizes the sexual organs, and the woman, holding her protuberant breasts, suggests one of two images. The first is of explicit, aggressive sexuality. Her position, squatting and low, conveys an invitation for sex in which she would be on top--a sign of female dominance. The second is one of autoeroticism. The woman acts to please only her herself; she extends no invitation.

Gerald first finds her "wonderful, conveying the suggestion of the extreme physical sensation, beyond the limits of mental consciousness" (Lawrence, 1920). Although Gerald recognizes the sensual nature of the carvings, the wonder he expresses is not one of intellectual curiousity, rather it is of fear and dread. As Rupert and Gerald view the statues, Rupert states, "They are art, because they convey the complete truth of that state, whatever you want to feel about it" (Lawrence, 1920). Gerald's reply is conventional, he thinks they are obscene. He also tells Rupert there is no culture in the carving because it is not "high art." Rupert answers, "Pure culture is sensation, culture in the physical consciousness, really intimate physical consciousness, mindless, utterly sensual. It is so sensual as to be final, supreme" (Lawrence, 1920). This produces form Gerald only simple denial: "You like the wrong things, Rupert." Gerald's response reflects his Apollonian outlook on a culture that is different from his own. The African sculpture evokes images of darkness and sensuality--qualities deemed unacceptable according to Gerald's Apollonian point of view.

Gerald's Apollonian affinity points to Greek sculpture. The artistic opposite of African sculpture, it is the "ideal form" that represents the enlightened civilization in which the Apollonian lives. For example, an Classical Greek statue of Venus, while evoking sensuality, conveys a different message from the African. She is neither invitational nor autoerotic, and is meant to be admired, but not touched. While the African women unabashedly uses her hands to expose herself, Greek sculpture often shows its subjects covering themselves to hide their nudity. Gerald sees light and civilization in these white marble creations, while the African carvings, of a rich, warm wood, evoke images of darkness and sensuality. Later in the novel, Lawrence has Rupert come to the realization that the "mindless sensuality" found in the carvings is just as destructive as the Apollonian image of civilization. Rather than cultivation of an extreme, Lawrence must have Rupert seek a balance between his Apollonian and Dionysian states. Rupert, as the voice of Lawrence, knew the value of learning from the art, from Africa, and from the "primitive," however, one should not go native like Conrad's Kurtz.

African sculpture came to serve the needs of Lawrence through his studies on cultural development theories formulated in the late nineteenth and early twentieth centuries. Lawrence intensely studied the sculptures described in Sir James Frazer's The Golden Bough and Totemism and Exogamy, Sir Edward Tyler's Primitive Culture, and Jane Harrison's Ancient Art and Ritual. Paul Guillame describes the knowledge available at the turn of the century:

> Negro sculpture was known only to an occasional missionary, who would write home with horror of the "hideous idols" of the savages, and to a few explorers and ethnologists, who collected them among other phenomena of African life, without suspecting that it might ever be taken seriously as art. (1926)

African sculpture was discovered by European explorers during the late fifteenth century, and the first African pieces made their way to a museum in Ulm, Germany in the late sixteenth century. They may still be viewed there today. Texts disagree, however, on the exact time the material culture of Africa began to be appreciated for an aesthetic, rather than ethnographic purpose. Dates for the initial appreciation range from 1904-1907, but culminated in 1915 with the publication of Negerplastik, the first book on African art, authored by Karl Einstein. African sculpture had begun to shape the cultural arts, and artists themselves began to show an African sway to their pieces. Waclaw Korabiewicz notes that four years after the publication of Negerplastik, "the periodical Action printed 'Opinions on Negro Art'" (1966). One of the co-authors was Pablo Picasso. Picasso's cubist movement was strongly influenced by African sculpture. Lawrence himself appreciated Picasso for "his wizard, sensuous apprehension of the earth" (1920). Picasso's paintings bear a similarity to African art: angular yet sensual, his work explicitly displays sexuality, and demands admiration.

While the writings of Harrison, Tyler, and Frazer do discuss the material culture of Africa, they also treat the subject with an edge of European ethnocentrism. Inez Morris notes that Lawrence probably realized this because his descriptions of the art "emphasize culture and elegance, rather than barbarity" (1983). In Lawrence's letters we find strong evidence that he felt some connection with what Harrison, Tyler, and Frazer were stating in their works, yet he often went one step further, and postulated his own theories on the development and origin of man and culture. In a letter to Bertrand Russell, Lawrence describes his reaction to Frazer:

> I have been reading Frazer's Golden Bough and Totemism and Exogamy. Now I am convinced I what I believed...there is another seat of consciousness [other] than the brain and nervous system: there is a blood consciousness which exists independently of the ordinary mental consciousness....One lives, knows, and has one's being in the blood, darkness. And the tragedy of this our life, and of your life, is that the will has gone completely over to mental consciousness, and is engaged in the destruction of your blood being...the final liberating of the one, which is death in result. (1917)

In this letter to Russell, Lawrence defines the ultimate struggle that all humankind faces and later writes about in Women in Love. The Dionysian blood instinct must form a balance with the Apollonian mental consciousness without one becoming too dominant. The blood instinct is internal, and pulses with life. The intellectual consciousness, while also internal, all too often dictates the choices and actions of one's existence. These two states of consciousness must coexist in peace in order for the individual to achieve a fulfillment of being. In this struggle rests the tragedy of Gerald Crich. His will goes completely over to one side, and he finds only death due to this adherence to an extreme. Lawrence would have been more accurate in titling his novel Men and Women in Love, because this struggle between the blood consciousness and mental will is a conflict known by both sexes.

While the writings of Harrison, Tyler and Frazer are important in discussing the influences on Lawrence's work, the actual presence of African sculpture in the life of Lawrence also impacted his writing. Two collections, one public and the other private, are known to have been seen by Lawrence. One collection, housed in the British Museum, was visited by Lawrence in September of 1914:

> I know...what we are after. We want to realize the tremendous non-human quality of life--it is wonderful. It is not the emotions, nor the personal feelings that matter....Behind us all are the tremendous unknown forces of life, coming unseen and unperceived...driving us, forcing us, destroying us if we do not submit to be swept away.

In the sculpture of these past civilizations, Lawrence sees an embodiment of the sensual nature he desires, yet it is a small remnant of time already past. Lawrence feels that the modern societies of today can learn from the sensual wisdom represented by the by this culture, and in doing so, become more in touch with a side of man too long repressed.

While Lawrence's letters reflect his perceptions of African art in public exhibits, his experience with a private collection made it into Women in Love. Julius Halliday, owner of the two sculptures Rupert admired in the chapters "Fetish" and "Creme de Menthe" had a real life

BEST COPY AVAILABLE

counterpart in Lawrence's friend Philip Heseltine, who also owned two. Rupert and Gerald, in discussing Halliday's personality, hint at an Apollonian and Dionysian contrast, "on the one hand he is a religious maniac and on the other he is fascinated by obscenity" (95). Halliday's vacillation between a life of Apollonian purity and Dionysian revel in the senses is yet another example given by Lawrence of a failure to maintain a balance between the two.

With Lawrence's placement of African sculpture in Women in Love comes both praise and criticism. While some see Lawrence's use of the sculpture as an enlightened move, embracing the culture of Africa, others deem it to be yet another romanticized misinterpretation of Africa by a disillusioned European. While these two notions both contain some merit, they are both flawed. The controversy rests in whether Lawrence was and advocate for primitivism or merely expressed enthusiasm for the art of Africa. Viewing Lawrence's work through the context of time, however, points to a blending of both notions, rather than an embrace of one instead of the other.

Lovejoy and Boas define primitivism as "the discontent of the civilized with civilization....It is the belief of men living in a relatively highly evolved and complex cultural condition that a life far simpler...is a more desirable life" (1965). Lawrence may have appreciated this definition because of the conditions surrounding him while he was writing Women in Love. Europe was in the midst of World War I and the novel was written in 1916, the bloodiest and most terrifying year of the conflict. At the end of the novel Lawrence himself notes,

> it is a novel which took its final shape in the midst of the period of war, though it does not concern the war itself. I should wish the time to remain unfixed, so that the bitterness of the war may be taken for granted in the characters. (1920)

It is no wonder Lawrence appreciated aspects of primitive cultures. World War I was a war between nations of the highest industrialized order, and yet, at the risk of self-annihilation, countries who considered themselves the apex of "civilization" were producing machines of death and destruction with which they committed unspeakable acts of atrocity against their fellow man.

Lawrence's enthusiasm for the cultures described in the writings of Harrison, Frazer, and Tylor were an important influence in his writings, yet his primitivist impulses may have also been shaped by writings on primitive cultures that had little scientific merit to them, or were works of pure fiction. For example, Olive Schreiner's The Story of an African Farm, Herman Melville's Omoo and Typee, and Joseph Conrad's Lord Jim all involve the adventures of Europeans in exotic locales. In a letter to Robert Montsier, Lawrence rues, "To think what has become of Melville's beautiful Typee! A million curses on European civilization. It is collapsing and deserves to collapse. I spit on it" (1917). Lawrence's disgust for European ways does give credibility to both an embrace of African culture because it lacks the qualities of development and industry found in Europe, and a romanticized notion of the culture because in it he saw an idyllic quality of life.

Lawrence's appreciation for African sculpture may be quixotic, but he is not alone in his manner of thought. By the standards of today, many people of both the early twentieth century and the present still maintain misconceptions about "primitive" art. Sally Morris points out these false perceptions and misunderstandings when she lists, side by side, definitions of primitive art. The first, considered "authentic," is scientifically accepted by anthropologists and historians: "Properly, it is the art of those people who have remained until recent times at an early technological level, who have been oriented towards the use of tools, but not machines" (qtd. in Kramer 1989). The second definition, cited by the author, is a more generic, commonly held term that glaringly illustrates an ethnocentrism still held by many people today:

> Any art made by persons, who, in Westerner's metaphorical imagery of the Family of Man...genetically related and genealogically equal but not yet trained to repress their natural urges in conformance with the rules of civilized behavior. (1989)

Herein lies the problem of Women in Love. While the sculptures were carved with simple tools rather than machines of industry, Lawrence equates the sensuality he sees as destructive to the order of life. The people represented, Lawrence perceives, face only self-annihilation due to their inability to merge their sensual and sensible natures. In looking at the art of another culture, Lawrence understood man must not take an Apollonian stance and view it from within the context of his own society. Rather, he must remain open to a Dionysian influence without being consumed by it.

While Women in Love illustrates Lawrence's vision of the destructive nature of extremes, it is not an apocalyptic vision of the end of man due to his inability to reconcile his sensuous and sensible consciousness. The mind cannot exist without the body, just as the Dionysian cannot exist without the Apollonian. As Jack Stewart observes, Lawrence's concept of culture was not a "continuum," but "a series of experiments along parallel lines" (1980). Humanity is not a straight path originating in birth and ending in death; rather it is a continuing process from which we learn from the experience of others. Culture and civilizations do die, but they are reborn again and again in other cultures. Lawrence sums up his vision of African sculpture and European society in a critique he wrote shortly after Women in Love was completed:

> No man can look at the African grotesque carvings...without seeing in them the infinitely sophisticated soul which produces distortion from it own distorted psyche, a psyche distorted through myriad generations of degeneration. (1921)

In Lawrence's eyes, the presence of African art then becomes a mirror to the inner consciousness of the viewer. This is why Gerald, as the "sophisticated" Nordic exploiter, is repulsed by the carvings and Rupert, as the embracer of sensuality, admires them. Lawrence warns, however, that while the carvings encourage sensuality, they must serve as a reminder of the destruction the generations face if they clutch an extreme existence. Humankind must not be an embrace of Dionysus or Apollo, it must be a relation of synthesis between light and earth.

A Poststructural Analysis of Richard Wright's "Big Black Good Man"

James S. Guignard Jr.

Department of English
Coastal Carolina University

Faculty Advisor:
Dr. Jill Sessoms

In *Playing in the Dark: Whiteness and the Literary Imagination*, Toni Morrison speaks of Miss Haversham, a character from *Sapphira and the Slave Girl*, being trapped in her decaying body and escaping her condition by mistreating Nancy, one of her slaves. Morrison further states that if the "Africanist characters and their conditions are removed from the text of *Sapphira*, we will not have a Miss Haversham immured or in flames. We have nothing . . ." (26). This assertion can easily be applied to the characters in Richard Wright's short story "Big Black Good Man."

Wright's story is one of misunderstanding and fear between the main character, hotel clerk Olaf Jensen, and the big black good man (whose name, Jim, appears only *once* in the story). "Black" is the key word here because without the blackness of the African Americans, Wright would have no story. This leads directly to the suggestion of what many literary critics call the "black aesthetic."

Adam David Miller claims a black aesthetic stems from African American writers writing about themselves "from a point of view that takes black life seriously, that views it in scale, with human dimensions" (380). In writing "Big Black Good Man," Wright applies a postmodern spin to the black aesthetic by demonstrating Olaf's lack of awareness about the black condition and by showing Olaf's own insecurities.

In presenting Olaf's insecurities, Wright invites a psychoanalytical reading of his work. Sigmund Freud's theory of projection, defined by Eagleton as "ascribing to others . . . feelings and wishes which are actually our own" (159), can be applied to the animosity Olaf feels towards a complete stranger (the big black good man) who simply wants a room for a few nights. The confrontation between the two is unprovoked, yet Olaf 's mental anguish nearly pushes him to murder the big black man. And the mentality with which both male characters, and even Wright himself, approach the female characters invites a feminist reading.

"Big Black Good Man" was written by a male with the main characters being male and, in this patriarchal setting, the female characters tend to have either a hostile voice or no voice. "This pattern," Priscilla L. Walton contends, "reflects the position of women within patriarchy wherein they are 'objectified,' or turned into objects whose purpose is to support the male subject[s]" (255). Objectification of the female characters is consistent throughout Wright's work and, with the advent of feminist criticism such as Walton's, his work is frequently attacked as a result of this trait.

This paper addresses the issues raised above in three interwoven parts, beginning with the idea of a black aesthetic present in Wright's story. Miller thinks of aesthetics as *"a way of viewing and sensing and the results of what is viewed and sensed"* (374). In these terms, aesthetics can apply to anyone, including Olaf. Wright gives the reader insight into Olaf's view of *his* own world early in the story:

> Through the open window Olaf Jensen could smell the sea and hear the occasional foghorn of a freighter; outside, rain pelted down . . . drumming softly upon the pavements of Copenhagen . . . [he] said half aloud . . . "I'll be sixty tomorrow. I'm not rich, but I'm not poor either . . . Got good health. Traveled all over the world and had my share of

> the girls when I was young . . . I own my home. Got no debts. And I love digging in my garden." (721)

Olaf, at sixty, tries to convince himself that he is not a failure. He makes further references in the passage to money by stating "money ain't everything" and laments the fact that he and his wife never had children. "Karen and I," he says, "could of had some children, though. Would of been good company" (721-22). His viewpoint can be labeled as his aesthetic because he sees the world around him through this ideology, peculiar to himself. It is precisely this blindness to other viewpoints that causes him to react negatively to the presence of the big black good man.

When Olaf is first confronted by the black man, a sailor in search of a room, he is stunned. Olaf stares "at the huge black thing that filled the doorway. . . . [it was] the biggest, strangest, and blackest man he'd ever seen in all his life" (723). He notices that the "ebony giant is well dressed . . . and [wears] black shoes that [gleam]" (724). Olaf realizes quickly that he is dealing with a successful black man—the binary opposite of Olaf's situation—and quickly judges the black man to be trouble. The problem with Olaf is that he is a "victim of . . . limited vision; that is, [he] lacks the psychological insight or the ability to fathom reality, except from [his] own narrow perspective" (Taylor 44). Instead of being aware of the big black man as having perspectives or aesthetics of his own, Olaf simply sees him as an object, albeit a threatening one.

Two of the binary opposites found in "Big Black Good Man"—rich/poor and white/black— are common in many works of literature, including Morrison's *Beloved* and Wright's *Native Son*. What is interesting about Wright's presentation of the binary opposites in this story is that the normal relationship between the pairs has been inverted. In stereotypical Western society, it is safe to say that rich/white are almost always aligned, as are poor/black. However, Wright reverses the normal order by depicting the black man as financially solvent and the white clerk Olaf as poor. This reversal lends strength to the role of the black man and, since it is not the norm, increases Olaf's discomfort in the situation.

The reasons for Olaf's perceiving the black man as a threat are perhaps best understood using psychoanalytic methods. In the opening paragraphs, Wright presents Olaf as satisfied (although it seems as if Olaf must convince himself of it) until he is confronted by something he is not and will never be—successful. At the age of sixty, Olaf's life is winding down. He has a wife, a garden, a house, no debts, and a dead-end job. His life would be considered a success by some standards but not nearly as glamorous and successful as the life of the well-to-do sailor wanting a room. Olaf, already struggling *not* to feel inadequate, lacks enough confidence in himself and his present situation to avoid feeling inferior to the big black man. Wright writes:

> There was something about the man's intense blackness and ungainly bigness that frightened and insulted Olaf; he felt as though this man had come here expressly to remind him how puny, how tiny, and how weak and how white he was. Olaf knew, while registering his reactions, that he was being irrational and foolish; yet, for the first time in his life, he was emotionally determined to refuse a man solely on the basis of the man's size and color. (724)

This reaction of Olaf's relates directly to Sigmund Freud's theory of repression, which contends that "much of what lies in the unconscious mind has been put there by consciousness, which acts as a censor, driving underground unconscious or conscious thoughts or instincts that it deems unacceptable" (Murfin 208). The big black man represents everything that Olaf wants, like monetary wealth, but could not achieve. He gives Olaf "two thousand six hundred" dollars to hold so the black man can "get drunk"(725). Also, the black man gets "a bottle of whiskey and a woman," which Olaf, "wild with anger and insult," supplies (726). As a clerk, Olaf frequently attends to requests for women, yet it bothers him to cater to this black man's desires. It is apparent that Olaf struggles with the perception that the black man has power over him, the reverse of which Olaf has never enjoyed.

Wright portrays whites as assuming all African Americans are evil in their blackness, even before any meaningful contact is made and even if the whites do not *think* of themselves as racist. A typical example would be the revulsion Olaf experiences when he makes the observation that "this particular black man . . . didn't seem human. Too big, too black, too loud, too direct, and probably too violent to boot" (724). However, another reading can just as easily be made if one considers Freud's hypothesis that "all of us have repressed wishes and fears; we all have dreams in which repressed feelings and memories emerge disguised" (Murfin 209). This reading can be viewed as a manifestation of Wright's subconscious in the form of the big black good man as a representation of African Americans—especially after the persecution experienced by them at the hands of slave traders—gaining power over whites. Freud states that "the creative writer does the same as a child at play. He creates a world of phantasy [sic] which he takes very seriously—that is, which he invests with large amounts of emotion—while separating it sharply from reality" (421). The racism prevalent during Wright's career undoubtedly affected his work and could have easily led to latent desires for power. The big black man, it can be construed, demonstrates consistently his power over Olaf. For example, when Olaf reaches for the black man's suitcase to carry it to his room, the big black man says, "That's too heavy for you, big boy; I'll take it" (726). Later in the story, Wright writes of Olaf reflecting on the big black man:

> . . . he could not shake off a primitive hate for that black mountain of energy, of muscle, of bone; he envied the easy manner in which it moved with such a creeping and powerful motion; he winced at the booming and commanding voice that came to him when the little tiny eyes were not even looking at him; he shivered at the sight of those vast and clawlike hands that seemed always to hint of death. (728)

Not only does the big black man represent everything that Olaf desires; he has complete control over Olaf as well. Through the use of such terms as "envied," "powerful," and "commanding," Wright shows Olaf to be helpless in the presence of the black giant. The most important manifestation is Wright's use of the concept of death created in Olaf's mind. There is nothing more powerful than the ability to give life or to take life; and, although this perception appears to be strictly a construct of Olaf's unstable mentality, it can just as easily be seen as Wright's own wish or dream covertly making its presence felt.

Freud suggests, in his theories concerning the conscious and unconscious mind, that "the powers motivating men and women are *mainly* and *normally* unconscious" (Murfin 208). Armed with this hypothesis of Freud's, one can easily recognize that Wright might not have been aware of this urge to reverse the power structure between African Americans and whites when writing "Big Black Good Man." Furthermore, one cannot blame Wright for subconsciously desiring this reversal. But to further neglect the inferiority complex that is Olaf's true liability would diminish the overall impact of the work.

The inferiority complex is apparent in Olaf's wish for the black man's destruction after he checks out of the hotel. In fact, the wish becomes an obsession, especially in light of the embarrassing incident in which a terrified Olaf, thinking the black man is about to strangle him, wets his pants as the big black man measures Olaf's neck with his hands for his shirt size (730-31). Later that night, Olaf

> lay awake . . . dreaming of revenge. . . . The ship would sink slowly to the bottom of the cold, black, silent depths of the sea and a shark, a *white* one, would glide aimlessly about the shut portholes until it found an open one and it would slither inside and nose about until it found that swollen, rotting, stinking carcass of the black beast and it would begin to nibble at the decomposing mass of tarlike flesh, eating the bones clean. . . . Olaf always pictured the giant's bones as being jet black and shining. (732)

The fantasy, for Olaf, "lived persistently on . . . and when Olaf found himself alone, it would crowd and cloud his mind to the exclusion of all else" (732-33). This passage is key to understanding Olaf's psychological blueprint. Freud was "interested in writers . . . who relied heavily on symbols. Such writers regularly cloak or mystify ideas in figures that make sense only when interpreted, much as the unconscious mind of a neurotic disguises secret thoughts" (Murfin 210). Wright's symbolism is intense and detailed, even down to Olaf's perception that the giant's bones were black. The big black man has become the personification of all that Olaf dislikes about himself and Olaf projects these distasteful traits onto him. Olaf sees the big black man as violent, yet only Olaf entertains violent thoughts; Olaf sees him as a killer, yet only Olaf feels a need to pull a gun on the big black man when he gives Olaf some shirts. After all, when Olaf first encountered the big black man, he was simply a man. Olaf actively bestowed the negative characteristics on him.

Recognition of his narrow-minded and foolish actions comes to Olaf at the end of the story when he realizes the big black man is not planning to kill him. Olaf begins living a nightmare when the big black man walks through the door of the hotel after an absence of more than a year. When the big black man reaches into a bag, Olaf reaches for his gun, determined to have his revenge. However, he is shocked to find that the big black man wants to give Olaf six shirts, one for each night he spent with the prostitute, Lena. Olaf finally comes to the realization that there is a "compassion" in the big black man's "stare that he had never seen before" (735). Olaf becomes aware of the big black man as a person for the first time and ceases to project his own inadequacies on the black man.

While the power struggle between Olaf and the big black good man is resolved by the end of the story, the women in this story are continuously objectified and, with the possible exception of Lena, stand no chance of ever gaining a voice. Wright objectifies the three female characters in the following passage in which Olaf ponders his fear and the availability of someone to discuss it with:

> Olaf kept his counsel. He never spoke to Karen about the sordid doings at the hotel. Such things were not for women like Karen. He knew instinctively that Karen would have been amazed had he told her that he was worried sick about a nigger and a blonde whore. . . . No; he couldn't talk to anybody about it, not even the hard-bitten old bitch who owned the hotel. She was concerned only about money; she didn't give a damn about how big and how black a client was as long as he paid his room rent. (728)

In this passage, Karen is seen by Olaf as someone not to share problems with although she is his wife—theoretically, his partner and confidant. Yet, she is portrayed as one-dimensional, lacking intelligence enough to be told of events affecting Olaf's life. Lena is referred to only as a "blonde whore." Finally, Olaf says the owner of the hotel (his boss) is simply an "old bitch." In presenting his female characters in this fashion, Wright "utilizes the gender power imbalance by taking it upon himself to represent femininity, at the same time that he distances himself from femininity through his masculine signature" (Walton 254).

Lena's lack of status at the beginning of the story contrasts heavily with her importance to the big black good man at the end of the story. The big black man receives a bottle of whiskey and Lena on the first night he spends at the hotel. And when he calls for her the next night, it sounds as if he is ordering groceries: "'I want that Lena again tonight. And another bottle of whiskey'" (729).

Olaf says to the big black man at the end of the story (after realizing he isn't going to be killed), "'You want Lena, don't you? . . . But I don't know where she is. She never came back after you left—.'" The big black man replies, "'I know where Lena is. . . . we been writing to each other. I'm going to her house'" (735). Ironically, Wright uses a member of the oppressed race to raise the standing of a member of the oppressed gender by allowing the big black good man to end Lena's need to work as a prostitute to support her four children. Yet, Lena is still denied a voice because, as Walton explains, "any indication of desire on her part signals her attempt to perform as a subject of discourse, and this is a position that the patriarchal order cannot afford her, for it requires her objectification in order to affirm the subjectivity of the male" (256). In other words, Lena is present *only* in the conversation between Olaf and the big black good man.

Although the majority of Wright's characters in "Big Black Good Man" are white, there is still a black aesthetic present in his work, though it is largely unseen. Wright set his story in Denmark in order to allow the big black man the luxury of confidence and to accommodate his boldness. If Wright had set the story in the United States, the character might have had the characteristics of Bigger in *Native Son*. Due to the racial conflicts pervading the United States during Wright's lifetime, he was aware of the need to figuratively leave the country in order to create a successful African American character. The presence of mind that allowed Wright this insight can only come from views peculiar to African Americans, hence, the black aesthetic.

"Literature," according to Addison Gayle, Jr., "and Black literature in particular, should afford revelation and insight into truth when created under conditions favorable to free, honest expression" (526). Richard Wright achieves both revelation and insight into truth in "Big Black Good Man." Through the use of African American criticism, psychoanalytical criticism, and feminist criticism (as well as smatterings of poststructuralism and Marxist criticism), there are a plethora of lessons to be learned from Wright's short story. The presence of a confident African American figure on foreign soil and the resultant psychological struggles of Olaf are two of the more fascinating facets. This short story also gives valuable insights into the female characters as objects rather than subjects having a voice.

The truly liberating part of researching this work through the use of poststructuralist criticism is discovering how completely interwoven the various critical approaches are. Wright, in a masterful, complex, and layered short story, raises many postmodern questions common to current literature. Like Sethe in Morrison's *Beloved* reaching answers about her own self-worth after killing her child, Olaf even begins to get answers by the end of the story, especially concerning the goodness of the person Olaf now labels as the "big black *good* man."

WILLIAM SHAKESPEARE'S
OTHELLO: THE MOOR OF VENICE
A CASE STUDY IN THE THERMODYNAMICS OF EVIL

ABSTRACT

WILLIAM SHAKESPEARE'S OTHELLO: THE MOOR OF VENICE - A CASE STUDY IN THE THERMODYNAMICS OF EVIL APPLYING DYNAMIC TENSION: A QUANTIFIED, ANALYTIC THEORY OF EVALUATION. Roger A. Harris (Dr. Linda K. Barlow), Department of English, Fayetteville State University, 1200 Murchison Road, Fayetteville, NC 28301

This essay applies the principle laws of thermodynamics as filters in determining the nature, progression, and final state of Evil present in William Shakespeare's romantic tragedy Othello, the Moor of Venice. Further, through the application of the theorem entitled Dynamic Tension, it introduces a means of quantifying the analysis of literature by graphically revealing the dynamic structural devices a writer (Shakespeare) must employ when creating thematic movement within a work. Dynamic Tension's application allows an audience to "see" the key aspects of a pres4enter's analysis of a particular literary work (Othello, The Moor of Venice).

This essay's synthesis of knowledge from the fields of science, literature, and mathematics (Economics) reflects the growing importance and legitimate practical application of, as well as the relevant inter-connections to be realized, when cross-discipline research is encouraged, attempted, and successfully accomplished.

Shakespeare's romantic tragedy, Othello: The Moor of Venice, is one of the most striking works on the subject of Evil in all of literature. While many analysts have chosen to focus on the various sub-themes in the work (jealousy, hate, envy, misogyny, racism, bigotry) and the various sub-plots used to illuminate their dark and sinister relationships, it is yet the overwhelming imbued presence of evil that binds their wicked intent and raises their dark and unified effect into a singular, horrific oneness; an evil expressed throughout the breath of the play that becomes its ultimate, lone, screaming voice unto the plays horrific end. Indeed, a close reading of the work leaves the scholar questioning (1) the true source of Iago's deeply evil hatred of and for Othello and (2) how a man of Othello's intelligence and experience could be so easily duped by Iago's contrived and pretentious schemes. And although the play offers some textual explanations that hint at a suggested reasoning for the evil that overwhelms the work, one falls short in trying to access the true level, degree, and intensity of that same evil which overrides all other thematic attributes concerning Othello.

However, when first viewed as a form of energy and then filtered through the laws of thermodynamics, the contagious evil that so cancerously infects the play is not only more easily explained, but also a deeper appreciation of Shakespeare's knowledge of the cosmic force and affect of Good and Evil is likewise gained and understood. And, when contrasted to Salvation, Othellos unveiled, dominantly negative, yet universal and spiritual theme reveals that just as a sinner can be overtaken and redeemed through righteousness and Faith, so too can righteousness and Faith be overwhelmed, possessed, and even destroyed by an all-forsaking evil. The overpowering presence and nature of evil within Othello therefore will be filtered through the laws of thermodynamics to not only explain the play's thematic "gaps," but also to gain a more keen insight of and for its reason, purpose, and application within the work.

One can textually identify and define at least four limited motivations of and for Iago's contemptuous hatred and evil as (1) his pedestaled jealousy at Cassio's appointment to lieutenant (1.1.8-34); (2) his deluded belief that Othello was having an affair with his wife (1.3.387-391); (3) his secretly hidden love for Desdemona (2.1.292-294); and (4) his stilted love affair with Cassio (3.3.426-440). Yet, even if these explications are accepted, either singularly or combined, they still can not and do not explain Iago's raging evil. Indeed, the renowned poet, scholar, and philosopher Samuel Taylor Coleridge stated that detecting the source of Iago's evil amounted to "the motive hunting of a motiveless malignity." Here, Coleridge is very simply yet very specifically speaking to a cosmic presence as the source for Othellos evil as opposed to the grounded explanations offered above. Shakespeare, in seeming agreement with Coldridge's cosmic assertion, textually reveals as much when he states through Iago that "I am not what I am (1.1.67)" and again in act five with Iago's response to Othello's claim that when stabbed, if he (Iago) dies he is a man but that if he lives, that he be a devil: Iago responds "I bleed, sir, but not killed (5.2.296)." The evil force that infects Iago and corrupts Othello as a whole is thus revealed as a principality of and with a cosmic source: the Devil (5.2.308-311). Indeed, the words "devil" and "hell" are used jointly not fewer than thirty times throughout the breadth of Othello, obviously a very dominant (and one would think purposeful) structural application and thematic characteristic designed to create and enhance the work's dark mood and sobering effect; an ingenious and masterfully applied Shakespearean foil that forces Othellos audience to both confront and contend with the evil nature of Man while also recognizing and comprehending the very Cosmic nature of Evil itself.

When viewed in this Cosmic sense and accepted on this Cosmic level, the connotative essence and presence of Evil/Devil/Hell as applied to Othello then become merely grounded societal reference points of and for a type or degree of negative cosmic energy, just as Goodness/God/Heaven likewise become grounded societal reference points of and for the same such type or degree of positive cosmic energy. By extension, these societal labels of Good and Evil can further be viewed scientifically as, and represent, ordered forms of energy that indicate the source of evil in Othell, explain its thematic gaps, and also mark the entry point at which the play is conjoined with and filtered through the first law of thermodynamics. This law states that Energy can neither be created nor destroyed, only transformed. Further, that ordered energy is useful, whereas disordered energy cannot be harnessed to do work. Applying this theory explains the plays first thematic gap: both how and why Iago was transformed into a raging beast--he was possessed by the harnessed negative, Cosmic energy of evil. His hate was amplified by both degree and circumstance because he yielded himself, through his own hate, unto the negative universal presence and force of evil within Nature.

Indeed, everyone in the play that died was afflicted by an infectious, grounded, negative energy that became amplified by the corrosive nature of negative evil: Brabantio's (Desdemona's father) racism (5.2.211-216); Roderigo's (Iago's rogue) lust of and for Desdemona (4.2. 193-198); Emilia's (Iago's wife and Desdemona's maid) traitorous deception of Desdemona (3.3.317-336); and Othello's self-doubt (3.3.211-221) and raging jealousy. Only the honest and chaste Desdemona dies guiltless among the sinning (5.2.126); she is an innocent victim, no less, of the power and force of a negative energy that was so powerfully transformed and boosted (both in proportion and degree) by the negative people surrounding her that her complete, whole and true innocence was literally consumed alive by their incarnate evil; a presence whose Cosmic force was transferred from the Devil, through Iago and Othello, then unto Desdemona herself, thus destroying her "Good Innocence."

The two combatively dominant themes present in Othello are evil as represented by Iago (1.1.7-9) and good as represented by Othello (1.1.17-28, 31-32). Of these two themes (or energies), evil would be considered the "hotter" of the two, both because it was presented to the reader first (through Iago: 1.1) and also because it sustained its perverse dominance throughout the breath of the work.

Also, good Othello weakened his righteous state when he indignantly eloped with Desdemona (1.3.78-81) instead of first asking her father for her hand in marriage (as was custom). A man at that time in good standing with both Brabantio (1.3.129-147) and the Duke (1.3.51-52, 173-177), Othello stood well to benefit by following protocol. By abandoning his noble character and eloping with Desdemona, he tainted and weakened his righteousness (positive energy), thus tempering his being for the onslaught of Iago's Evil fury.

Realizing this factor is key to explaining the plays second thematic gap (Othello's blazing descent from righteousness) and also in understanding its connection to and with the second law of thermodynamics.

This law states that a highly ordered system (Iago's hotter, dominant, negative energy) will tend to slide spontaneously toward and overtake a less ordered system (Othello's cooler and now submissive, positive energy) until equilibrium (a balanced and total dominance) is achieved. Applying this law helps one to understand how an otherwise experienced, righteous, and forthright Othello could so easily succumb to Iago's rather contrived innuendoes and simplistic accusations. Simply, it is a heated Cosmic negative energy (dominant evil in the form of Iago) that, being brought into thermal contact with Othello's tainted and weakened righteousness, rapidly overwhelms and possesses Othello; that rapidly proceeds to negatively balance these now disordered systems; that rapidly reduces Othello's righteousness to a state of uniform temperature as the negative energy flows from the hotter system (Iago's Evil) to the colder system (Othello's righteousness).

Indeed, it would seem that Othello's deep and abiding love for Desdemona would have provided the one absolute defense against the evil that so easily possessed Othello and drove him to murder the innocent Desdemona. Even attempts to explain his descent into this swampy evil based on his self-loathing are strictly inadequate when contrasted with his obvious success as a general and his generally held standing as a man of virtue (1.3.290-293). And even if one concedes this weak textual support as a causal point of departure for Othello's slipping into darkness, it still falls far short of the mark when factoring the time between his self-doubt and his possession. He released his self-pride, self-worth, and fell head-long into his self-doubt and self-contempt not in a matter of months, weeks, or days, but rather in a matter of hours. This temporal contrast seems to contradict Othello's noble character and nature established earlier within the play and thus bares and warrants a deeper observation and scrutiny from which to explain the cause of his later deterioration. The second law of thermodynamics (equilibrium) satisfies this need.

> The approach to equilibrium is therefore an irreversible process. The tendency toward equilibrium is so fundamental to physics [and Othello] that the second law is probably the most universal regulator of natural activity known to science (Britannica, p.702b).

There is, in fact, an often overlooked factor within Othello that supports the above quotation: it is, very simply, that even as Iago is the vehicle through which this Cosmic evil is transported, delivered, and distributed, he is yet the only major character within the work that survives its horrific wrath. To this point and in this sense it can be stated then, both in circumstance and effect, that equilibrium has been attained (literally in the form of Iago's lone survival, and specifically with respect to the play's transition from a countered evil in its beginning unto that same evil's amplified dominance and prevailing, overwhelming totality of sound and sense at the play's end).

The renowned Shakespearean critic David Bevington would have one to believe that

> Othello's reaffirmation of faith in Desdemona's goodness undoes what the devil-like Iago has most hoped to achieve: the separation of Othello from his loving trust in one who is good (Bevington, p. 1121).

This "reaffirmation of faith" matters not because Othello murdered Desdemona. Indeed, penance after the fact of sin is sometimes a greater crime than the sin itself. Further, Bevington offers the thought to the reader that "She [Desdemona] is the sacrificial victim who must die for Othello's loss of faith and by dying, rekindle that faith (Bevington, p. 1121)." What does Othello's "rekindled faith" matter when he kills himself also? Neither murder nor suicide is heroic, especially at the suggestedly narcissistic expense of self-knowledge or self-growth.

Bevington's assertions neatly underscore and introduce the third theory (In this case, not a law!) of thermodynamics, called entropy. Entropy is simply the constant movement of a system (e.g., this play) from a state of order to a graduated state of disorder. Having achieved this state, the system is said to be in equilibrium. Within Othello, the play's entropic progression from order to disorder may then be viewed as an example of the general tendency of chaotic disruptions (Evil) to disturb organization (the play) and structure (Othello). Any system that is subject to random agitation will eventually attain its most disordered condition, thus the haunted ending to this play.

With *Othello*, Shakespeare has done far more than simply, beautifully, and exquisitely investigate and reveal the human dynamics of jealousy, envy, hate, racism, and evil. He has synthesized their related human, mortal, and base associations into a singular platform used to springboard the unveiled and explained cosmic nature, expression, and dimensions (either Spiritual or thermodynamic) of evil in its most heightened state, ushered forth by the most articulate and accurate voice of his day on the subject; in a manner, of a level, and to a degree that only his vaulted genius would allow.

And in this Cosmic sense (as is offered by *Othello*), on any given day, one energy force, whether Good or Evil, can overwhelm the other and can also overwhelm you. Yet deeper still, I offer that either energy, whether Good or Evil, actually operates cosmically as a universal constant and that we, by our actions and interactions as instruments of conduction, are the only true variable that can ultimately determine (if only to a limited degree) the final degree to which either force will prevail and effect our life, state, time, and place. We need only touch to feel; we need only listen to hear; we need only see to relate.

DYNAMIC TENSION

Dynamic Tension is a theorem that, when applied, allows one to quantify their analysis of a work of literature by providing a two-dimensional representation of their analysis. Its simple, accessible, and strong foundation is based upon the observation that in order to move a readers psychological condition from a mute state to one that will follow the path of a theme presented within a work, that the theme must be counter-positioned against another theme to create movement. The force created by the counter-positioning of these themes is called Dynamic Tension. Thematic movement is determined by the dominance of (or emphasis upon) a particular theme (as with the theme of evil in *Othello*). Once a reader identifies what they feel are the two major themes, they would very simply place one theme on a horizontal axis, the other theme on a vertical axis, and by using their interpretive analysis to determine the points or degrees of measure, and use those points or degrees of measure to plot the thematic progression of the work.

In *Othello*, I have identified Evil (Iago) and Good (Othello) as its two major themes. Placing Good on the horizontal axis and Evil on the vertical axis, I then used the play's 15 scenes as my degree of measure. I have used negative numbers on the vertical axis to indicate and re-inforce my contention that the play ends in a totality of evil. Three major situations have been charted that reflect Dynamic Tension's usefulness. In Act 1, Iago pronounces his hatred of Othello, Othello's righteousness is established, even as Iago reveals its fall with the announcement of Othello's and Desdemona's elopement. In Act 3, when Iago convinces Othello that Desdemona is unfaithful while also obtaining her handkerchief. In Act 4, when Othello misunderstands Cassio's boosts. All circumstances presented within the play are resolved in Act 5.

The beauty of Dynamic Tension is that it is flexible to each reader's analysis. It doesn't force a predetermined outcome, it merely supports and quantifies the analysis that is offered by the reader. It is a very young theory, but also, I feel, both a relevant and revolutionary theory. It will change the way that we discuss, analyze, and present literary analysis, and I humbly request your input, critique, and responses.

Wilde's Christ does not conform to Victorian society, a society obsessed with productivity and order -- a scientifically-ordered society which places emphasis on proven fact (Morris 516). Instead, Christ embodies the rebellious aesthetic values which Wilde himself represents. Christ becomes a manifestation of beauty. He is given the status of both artist and artwork. He becomes a voice crying against "the blind mechanical forces of society."

Thus, Wilde adopts Christ, the very basis of Victorian religious morality, and transforms him into an activist against Victorian belief. Wilde displays his own ability as an artist, a creator of beautiful things, by translating Christ into an advocate of his own rebellion, an example of aestheticism.

In "The Critic as Artist" Wilde explains his belief that aesthetics are "higher than ethics" belonging to "a more spiritual sphere." He indicates the belief that beauty is truth and is resultantly the highest goal of all art and life. "They are the elect to whom beautiful things mean only Beauty," he wrote in the Preface to *The Picture of Dorian Gray* (Abrams 1627). Good and bad must be determined by their relationship to beauty.

Ethics, Wilde writes, have nothing to do with art. They are totally separate (Morley 73). But if the traditional determinants of morality are no longer acceptable, then something needs to replace the accepted moral structure, to transcend it as a higher good. This is where beauty manifests itself. Wilde envisions beauty not as the constraining, systematized ethics of old, but as a liberated vision in which beauty is the goal which defines the good, and the bad serves as everything which corrupts beauty. No standard of beauty can be given. The understanding of beauty is, like faith, something that cannot be learned from another person.

Aestheticism has often been referred to as the "Cult of Beauty" (Freedman 7). But it is a cult in which each of its adherents must find his or her own vision of beauty; there is no standardized vision. To standardize the vision would be to rigidify it, to halt imagination. To dogmatize or systematize beauty would simply transform it into an ironic mimicry of the reigning Victorian system -- the system which jailed Wilde because he did not conform to its standards.

The search for beauty allows one to transcend human limits. In creating and viewing art that is not harnessed in reality and systemization, humanity can overcome the imperfections of nature and the world. Wilde envisions a beauty that allows one to step out of the confinement of systems and science, away from earthly limits, traditional ideas of truth, and the tedium of everyday frivolity. To abolish the limits of truth, Wilde presents art as a lie, because art does not have a single meaning but is indefinite and infinitely suggestive. He writes, "No artist desires to prove anything. Even things that are true can be proved" (Abrams 1627). Since art is unconstrained by truth, it should also be unaffected by traditional ethics and morality.

Wilde asserts that life is failure from an artistic point of view. Nature and life are full of ugliness and imperfections, but Wilde insists that "art imposes form on the chaos of life and miraculously turns its raw material into things eternally beautiful" (Longxi 160). From this belief in art's ability to right all wrongs, he carried this artistic search beyond his critical theory and literary works into all aspects of his life. In the conclusion of *The Renaissance*, Pater seemed to advocate a hedonistic lifestyle: "Not the fruit of experience, but experience itself is the end" (Abrams 1533). The young Oscar Wilde declared *The Renaissance* to be "the golden book of spirit and sense, the holy writ of beauty" (Kimball 16). His search for sensation and beauty in the form of hedonism later became synonymous with Decadence and scandal.

Since no standard values of right or wrong exist within the aesthetics' solipsistic vision of ethics, the search for beauty can take many different directions. Nasaar writes about the dangers of this undirected search for beauty:

BEST COPY AVAILABLE

> Art that delves into the dark caverns of the soul and fully explores and celebrates the evil within can remain beautiful, but a way of life that seeks fully to translate inner evil into action will finally cease to be beautiful and become an inescapable nightmare. (Nasaar 72)

Thus, Nasaar's words imply that heedless search for sensation can result in decadence, corrupted beauty.

As a result of Wilde's flaunted "decadent" rebellion against the norm, many of his contemporaries did not take his work seriously. W.H. Auden's characterization of Wilde as "a phony prophet but serious playboy" adequately expresses the prevailing perception into the beginning of the twentieth century (San Juan 4). But Wilde's decadence should not be perceived as the defining characteristic of his morality -- for he eventually realized that the search for sensation must be moderated so that beauty prevails. In *De Profundis*, the letter written in 1897, during the time that he was jailed for sodomy, Wilde openly rejected his slip into a decadent lifestyle yet still asserted the primacy of beauty (Hart-Davis 423). Wilde writes, "I blame myself for allowing an unintellectual friendship, a friendship whose primary aim was not the creation and contemplation of beautiful things, to entirely dominate my life" (Hart-Davis 425).

Within *De Profundis* Wilde expresses his belief in beauty as the highest good and proposes Christ as a revelation of beauty. Quintus writes that *De Profundis* contains Wilde's fullest treatment of Christ and of Wilde's religious ideas (524). In this letter he depicts Christ as a paradigmatic aesthete. De Profundis, meaning "from the depths," is not the name that Wilde gave to his letter written from prison. He entitled the letter *Epistola: In Carcere et Vinculis*, which translated is Epistle: Imprisoned and in Chains. The title that Wilde gives his letter "recalls St. Paul's letters to the Colossians and the Philippians, from prison and in chains, and written for the education of new Christians in their faith" (Andersen 1). Thus, Wilde frames his letter as an epistle of aestheticism and himself as the suffering apostle spreading the "Gospel of Beauty."

Wilde's association of himself with Christ serves several possible purposes. First, it alleviates him of any guilt that he might hold about rejecting religion and belief in God. By incorporating traditional religious figures into his own ethics he is able to overcome any guilt that might have been caused by his abandonment of belief and morality:

> Given Wilde's love of artifice and his homosexuality, a sense of guilt or remorse seems inescapable within a Victorian context, unless Wilde could reject Christianity and embrace atheism or any religious position that countenanced his behavior and freed him of religious scruples regarding his mode of life. (Quintus 514)

By embracing Christ as an aesthete, Wilde can comfortably reject traditional Christianity without guilt.

More importantly, by depicting Christ in an unorthodox manner, by portraying Christ as a proponent of his radical ethics, Wilde is able to undermine Victorian ideas of morality and assert the supremacy of his own. He displays Christ as an artist, a work of art, and a prophet against systems -- a man embodying his own aesthetic beliefs.

Wilde clearly establishes Christ's identity as an artist in *De Profundis*. He asserts that Christ is "the true precursor of the romantic movement in life" (Hart-Davis 476). He is not concerned with Christ as a religious figure but as an aesthete. Indeed, Wilde proceeds to credit Christ with all of the qualities that are necessary in his conception of an artist:

> The very basis of his nature was the same as that of the nature of the artist, an intense and flame-like imagination. He realized in the entire sphere of human relations that imaginative sympathy which in the sphere of Art is the sole secret of creation. He understood the leprosy of the leper, the darkness of the blind, the fierce misery of those who live for pleasure, the strange poverty of the rich. (Hart-Davis 476)

By possessing an active imagination, Christ has the requisite ability of the artist to both judge and create beauty.

The Preface to Wilde's novel *The Picture of Dorian Gray* begins, "The artist is the creator of beautiful things" (Abrams 1627). Thus, the creation of beauty, not truth or a recognized moral value, is immediately established to be the primary purpose of art. Wilde's Christ is manifested as an artist because he reveals beauty in sorrow and even in sin, where most people are unable to perceive it. Wilde writes, "He regarded sin and suffering as being in themselves beautiful, holy things, and modes of perfection. It sounds a very dangerous idea. It is so. All great ideas are dangerous. That it was Christ's creed admits of no doubt. That it is the true creed I don't doubt myself" (Hart-Davis 487).

Wilde explains that the teachings of Christ the artist, which have often been interpreted into moral doctrines by orthodox Christianity, were merely suggestions that would allow people to possess more beauty in life; they had no moral purpose:

> When he says "Forgive your enemies," it is not for the sake of the enemy but for one's own sake that he says so, and because Love is more beautiful than hate. In his entreaty to the young man whom when he looked on he loved, "Sell all that thou hast and give it to the poor," it is not of the state of the poor that he is thinking but of the soul of the young man, the lovely soul that wealth was marring. (Hart-Davis 480)

Christ has the ability to use his imagination to recognize beauty, and thus find 'truth,' in places that many other people are unable to discover it, in places where the Victorians would never admit that beauty could possibly exist.

Christ also adheres to a solipsistic vision of beauty. Wilde points out the ability of Christ to create his own vision: "The strange figures of poetic drama and ballad are made by the imagination of others, but out of his own imagination entirely did Jesus of Nazareth create himself" (Hart-Davis 482). Wilde's Christ is a man of intense imagination who creates his "own dream of a world."

Christ's kinship with the aesthetic artist establishes him as an ally of Wilde's rebellious morality. His actions, his idea of good and truth, his very morality is determined by his pursuit of a personal vision of beauty. Ellman sums up in his biography of Wilde, "Christ is a precursor of the romantic movement, a supreme artist, a master of paradox, a type of Wilde in the ancient world" (515).

It is very important to remember that this affinity that Christ has to Wilde, Christ's profession as artist, is not a fact that immediately manifests itself in the Gospels. The Victorians certainly would not have maintained that the Christ they worshipped shared Wilde's aestheticism. So Wilde's act of portraying Christ as an aesthete and artist is the result of Wilde himself performing the function of artist and making Christ into an artwork that can then undergo transformation.

This perception of Christ as surface and symbol, a work of art, is central to Wilde's presentation of Christ as an example of aestheticism. For portraying Christ as an an artwork enables Wilde to perform the creative act of the critic. In his essay "The Critic as Artist," he writes that criticism "treats the work of art simply as a starting point for a new creation" (Abrams 1625). He further writes, "His [the critic's] sole aim is to chronicle his own impressions" (Abrams 1624). It is by first treating Christ as a work of art that Wilde can then use his imaginative observation process to reveal Christ as a new creation. Using the same materials that produced traditional ideas of Christ, he produces a Christ who manifests Wilde's own values.

In the Preface to *The Picture of Dorian Gray*, Wilde writes, "All art is at once surface and symbol" (Abrams 1627). Christ's transformation into art causes him to become the surface and symbol that can then become an image to reveal beauty. Wilde insists that Christ brings out the beauty in everyone, whether or not one has faith in him, for merely by coming in contact with him people find that the ugliness of their sins disappears and the beauty of their sorrow is revealed -- for Christ became the ultimate symbol of beauty (Hart-Davis 481). It is only as a symbol that he is able to transcend the mere human image. Wilde writes of Christ:

> And feeling, with the artistic nature of one to whom Sorrow and Suffering were modes through which he could realize his conception of the Beautiful, that an idea is of no value till it become incarnate and is made an image, he makes of himself the image of the Man of Sorrows, and as such has fascinated and dominated Art as no Greek god ever succeeded in doing. (Hart-Davis 48)

Christ becomes a concrete manifestation of the beauty for which Wilde searches. And since Christ can be perceived as an image, he is accessible. "He is just like a work of art himself. He does not really teach one anything, but by being brought into his presence one becomes something," Wilde writes (Hart-Davis 487). Christ's appeal as an artwork aids in a demonstration of the supremacy of beauty.

In addition to Christ's role as artist and artwork, Wilde contributes to Christ's aesthetic completeness by attributing Christ with the role of prophet against social system. Wilde's Christ shares the aesthetic disgust with the dogma and system of society. He is not content with society's lack of energy and imagination but attempts to catalyze humanity into an active pursuit of beauty. Christ does not accept the laws of society which restrain the full expression of his energies. Wilde writes:

> Christ had no patience with the dull lifeless mechanical systems that treat people as if they were things, and so treat everybody alike: as if anybody, or anything for that matter, was like aught else in the world. For him there were no laws: there were exceptions merely. (Hart-Davis 485)

Because Wilde's Christ does not believe in the restraining boundaries of traditional morality or adherence to the laws, he does not condemn the sinner. "Christ, through some divine instinct in him, seems to have always loved the sinner as being the nearest possible approach to the perfection of man," Wilde explains, "To turn an interesting thief into a tedious honest man was not his aim" (Hart-Davis 486).

Wilde explains that the essence of "things" lies in what we make of them. "Where others see but the Dawn coming over the hill," he quotes Blake, "I see the sons of God shouting for joy" (Hart-Davis 511). Wilde certainly shared Blake's ability to perceive things according to his desires; his presentation of Christ as the imaginative artist, artwork, and prophet who cries out against the restraints of society culminates in the image of a Christ who is a paradigmatic representative of aestheticism. Wilde perceives and transforms Christ into a superior example of the aesthetic life and a precursor of his own rebellion. The statement that Wilde makes about Christ's imaginative abilities could aptly be applied to Wilde himself. Wilde writes, "Christ's place is indeed with the poets. His whole conception of Humanity sprang right out of the imagination and can only be realized by it" (Hart-Davis 477).

Pearl's Scarlet Soul: The Influence of Spenser's Una on Hawthorne's Ideal Vision of Daughters

Faculty Advisor: Dr. John C. Bean

Many scholars have shown how Edmund Spenser's *The Faerie Queene* influenced Nathaniel Hawthorne's literary works. Evidence of Hawthorne's repeated readings of *The Faerie Queene* indicates that he knew the poem intimately and that it influenced the development of his allegorical writing style. However, Spenser's impact on Hawthorne's personal life has yet to be studied. Biographers agree that Hawthorne's admiration for Spenser led him to name his daughter after Spenser's Una in Book I of *The Faerie Queene*. This paper proposes that Hawthorne's reading of Book I of *The Faerie Queene* helped construct his vision of the ideal daughter. By naming his daughter Una, Hawthorne presupposed that she would embody the childlike qualities of truth, innocence, beauty, and femininity of Spenser's Una. However, as Una Hawthorne grew into a young girl, her appearance, temperament, and behavior more closely resembled Spenser's devilish Duessa, complicating Hawthorne's ability to bond with her. Hawthorne's ambiguous relationship with Una is projected onto his portrayal of Pearl in *The Scarlet Letter*, where he attempts to reconcile his feelings of loss and deception. In Pearl, Hawthorne integrates the allegorical meanings of Spenser's Una and Duessa, thereby achieving an understanding of the duality of his daughter's true human nature.

Unquestionably, Hawthorne read *The Faerie Queene* many times throughout his life. Spenser's poem was the first book Hawthorne purchased as a child with his own money (Martin 3). As an adult, in the late 1830's and early 1840's, Hawthorne boarded in the house of George Stillman Hillard, a close friend and editor of the first American edition of *The Faerie Queene*. In 1839, Hillard published *The Poetical Works of Edmund Spenser*. Consequently, Hawthorne reread *The Faerie Queene* in 1840 as evidenced by his letters to Sophia Peabody (*Letters 1813-1843* 473, 477). In 1842 and 1843, Hawthorne read Spenser aloud to his wife during his first winter at the Old Manse (Lathrop 54). Later, Hawthorne read the poem to his children while residing in England from 1853 through 1857 (*Hawthorne & His Wife* 9). Clearly, Spenser's poem made an uncommonly deep impression on Hawthorne's mind (Stewart 197).

By naming his daughter Una, Hawthorne ascribes to a view of femininity reflected in Book I of *The Faerie Queene*. To appreciate what Spenser's Una meant to Hawthorne, we must see how Hawthorne read Spenser through the perspective of nineteenth-century views of women and children shaped in the preceding century by Jean-Jacques Rousseau. According to this view, the ideal woman is pure, pious and submissive. In December 1829, Hawthorne read Rousseau's popular half-treatise, half-novel *Émile* (Books 69). Prior to *Émile*'s publication in 1762, children were viewed as miniature, imperfect adults. In response to this view, Rousseau proposed educational reforms in every aspect of a child's life, from before birth to adulthood and parenthood (Jimack xiii). With *Émile*, Rousseau transformed the fundamental attitude of parents toward children (xxv). It became fashionable among "enlightened" parents to bring up their children "a la Jean-Jacques" (xxiv).

Hawthorne's reading of Rousseau helped create a vision of daughters that parallels the image of angelic femininity in Spenser's Una. Rousseau considered *Émile* to be a work of moral philosophy because he believed that men were naturally good (ix). In fact, Rousseau begins his philosophy: "God makes all things good; man meddles with them and they become evil" (5). Thus, protecting nature and the natural good from the corrupting influences of society should be the goal of education (Rousseau 6-7, Jimack xiv). However, Rousseau believed that the education of women is absolutely subordinate to the needs of men (Jimack xviii). By nature, men should be strong and active with power and will (Rousseau 322). Conversely, women should be weak, passive and offer little resistance (323). Women can not fulfill their purpose in life without men's aid (328). According to scholar Patricia

BEST COPY AVAILABLE

McAlexander, women came to be regarded as domestic angels belonging to "The Cult of True Womanhood" (McAlexander 252-254, Welter 151-174).

The emergence of "The Cult of True Womanhood," however, required the repression of all those human traits not in accord with angelic femininity. Feminist critics Sandra Gilbert and Susan Gubar address literature's domestic angel in their comprehensive study of the struggle of the female writer in the nineteenth-century. Gilbert and Gubar use Book I of *The Faerie Queene* to show the existence of a monster beneath the angelic surface of women. According to Gilbert and Gubar, the essence of literary power is actually male sexuality because a literary text's author is a father, progenitor and procreator who generates life and creates a posterity for himself (4, 6). Furthermore, male authors have historically generated the ideal image of women as passive and morally pure. The image of feminine purity became recognized in the Middle Ages with the Virgin Mary. However, as Gilbert and Gubar explain, in the more secular nineteenth-century, "the eternal type of female purity was represented not by a madonna in heaven but by an angel in the house" (20). The angel in the house denies her assertiveness, aggressiveness and other male characteristics that in a woman appear monstrous, unfeminine and unpure (28). Thus, a monster is concealed within the angel. Monsters in the shape of women and women in the shape of monsters are common characters within male texts (29). Gilbert and Gubar use Spenser's Una and Duessa to illustrate their point: "Duessa deceives and ensnares men by assuming the shape of Una, the beautiful and angelic heroine who represents Christianity, charity, docility" (30).

As several critics have shown, *The Faerie Queene* profoundly contributed to Hawthorne's conception and development of his allegorical writing style (Jones 71, Martin 20, Himelick 21). But I also argue that Hawthorne's reading of Book I of *The Faerie Queene* helped construct his vision of the ideal daughter; to him, Spenser's Una represented the truth about women's nature (*Letters 1843-1853* 37). In Book I of *The Faerie Queene*, Una is introduced as the allegorical representation of Truth, including the true faith of Redcrosse and the true church (I.i.4, ft. 4, Spenser 7). Una signifies the indivisibility of Truth through her Latin name, meaning "one." As the one true church, Una leads a milk-white lamb. The lamb symbolizes Una's innocent purity and links her with Christ as the sacrificial lamb in John 1:29-30 (I.i.4, ft. 5, Spenser 7, Heale 27). Similarly, Una's humility is evident by comparing her "lowly Asse" to Jesus' young donkey in John 12:14 and Matthew 21:5 (I.i.4, ft.4, Spenser 7). Una's white complexion suggests her simplicity, beauty, femininity, and frailty. Furthermore, throughout Book I, the vulnerable and helpless Una wanders in search of her protector, Redcrosse (Meyer 42). In short, Spenser's Una represents truth, innocence, purity, vulnerability, simplicity, beauty, femininity, and frailty. Analogously, these characteristics are often portrayed in literature through the archetype of the child. Therefore, by naming his first daughter Una, Hawthorne presupposed that she would embody the childlike nature of Spenser's Una.

With Spenser's Una in his mind as the ideal daughter, Hawthorne strove to bond with his newborn daughter, but she soon began to reveal traits that were more Duessa-like than Una-like. For example, Una Hawthorne's red hair apparently did not fit her father's idea of femininity or beauty. On the day of Una's birth, Hawthorne wrote to his sister Louisa that the baby has *red* hair. In the letter's postscript, Hawthorne begged his sister not to mention the *red* hair in her reply (*Letters 1843-1853* 15). Hawthorne's next letter to Louisa reveals an assessment of Una's carrotty tinged hair. While Hawthorne believed his daughter would become pretty in time, she needed a little brown wig to be pretty now (20-21). One senses exasperation in Hawthorne's tone when his sisters and mother denied that Una's beautiful hair was tinted with red (30). In December 1844, Hawthorne conceded that, despite her snub nose and red hair, Una was a dear little thing (68).

As Una grew into a young girl, Hawthorne's assessment of her wavered ambiguously depending on how much she fulfilled his vision of ideal femininity. At four years old, Hawthorne considered his daughter most beautiful wearing a dark, shaded mousseline de laine morning gown against her fair complexion (*American* 193). This vision of his daughter's beauty sharply resembles Spenser's image of Una wearing a black stole and veil against her white face (I.i.4, Spenser 7). Unfortunately, three years later, Hawthorne felt disappointed when his daughter's fair skin became freckled and tanned (*Letters 1843-1853* 453).

Sometimes Una Hawthorne's voice reinforced her father's ideal of femininity; at other times, her voice dismayed him. For example, the feminine Una spoke "in a tone of the softest and sweetest milk and honey" (*American* 194). In admiration, Hawthorne commented, "She pours out an apparently half unconscious rhapsody, rhythmical, flowing along like a river, dim and vague" (205). Yet, at eleven months old, Una began to say "Adam"! Naively, her mother Sophia thought that Una was referring to her father as God's first man. Shortly, Una's statement was correctly interpreted: "Damn-damn-damn-often in dulcet tones, and then again as loudly and emphatically as if she were firing a cannon" (Miller 231). Consequently, Hawthorne concluded that Una was graceful and beautiful only when she was perfectly quiet (*American* 205).

In fact, Una's beauty seemed to be uncertain and transitory, suddenly appearing when least expected. Glancing sideways at Una, Hawthorne caught flashes of beauty as "rare and precious as the vision of an angel" brightening her face. However, the flashes mysteriously disappeared as she turned to face her father (201). Hawthorne described the momentary appearance of Una's beauty as the reflection of her soul: "[a] grace, delicacy, an ethereal fineness" (201). Furthermore, Una's feminine qualities of tenderness, wisdom, and the finest essence of delicacy yielded to her masculine tendencies of boldness, hardness and an unshrinking comprehension of everything. Observing his daughter, Hawthorne felt shaken and unsettled: "[T]here is something that almost frightens me about the child--I know not whether elfish or angelic, but, at all events, supernatural. . . . I cannot believe her to be my own human child, but a spirit strangely mingled with good and evil, haunting the house where I dwell" (210-211). Hawthorne's daughter sharply contrasts with the truthfulness, purity, simplicity, vulnerability, and frailty of Spenser's Una.

Undoubtedly, Una Hawthorne was a complex little girl. Lacking any humor, she could not stand to be laughed at for unintentionally saying or doing something funny. Furthermore, her attempts to be funny resulted in eccentricity, a wild grimace or an unnatural tone (*American* 199-200). Her nature was passionate, tragic and tempestuous (200). She had a "rhinocerous-armor against sentiment or tenderness" (202). Consequently, she ungraciously demanded favors in an imperative mood (201). Although she craved sympathy, Una simultaneously defied sympathy by continually putting herself in a position where she knew that she cannot receive it (200). Unlike Spenser's vulnerable and dependent Una, Hawthorne's daughter threw off male protection. Frequently, without giving her parents the slightest notice, the indefinitely adventurous child flew off through the front gate of her home into the unknown world (208).

Una's increasingly independent, wild and unearthly temperament and behavior baffled her father. She stared so intensely and remorselessly into her parents' faces that she "embarrass[ed] the springs of spiritual life and the movement of the soul" (201). To Hawthorne, Una seemed to be possessed by an "earthly monster, who lays his grasp on her spinal marrow, her brain, and other parts of her body that lie in closest contiguity to her soul" (205). With the devil in her, Una rushed from corner to corner of the room with the force and violence of a cannon-ball (202). Hawthorne noted that the image of a cherub or an angel peers out from the eyes of an innocent child and the image of the devil peers out from the eyes of a vicious person (117). Although Hawthorne envisioned a daughter in the image of Spenser's angelic Una, Hawthorne's daughter more closely resembled Spenser's devilish Duessa.

One can conclude that Hawthorne felt deceived by the false presuppositions that he had formed of his new daughter. Una Hawthorne failed to display the childlike qualities of her Spenserian namesake. Although Hawthorne loved his daughter, he felt frightened and bewildered by her. Nevertheless, Hawthorne seems to have understood the special responsibility of a father to respond to his daughter with love, admiration and guidance. According to psychologist Suzanne Fields, the father is a daughter's loving escort to the larger world. Fields writes, "The ties that bind a girl to her father must be fastened with a slipknot that moves as she moves, that does not constrict to impede growth" (76). Hawthorne's persistent attempts to protect and bond to his daughter ended in resistance and struggle. "[C]omplaining of cold, father wraps her in a blanket,--she resists--father insists--There is a terrible struggle--and she gets into almost a frenzy; which is now gradually subsiding and sobbing itself away in her mother's arms" (*American* 197).

This background on Hawthorne's ambiguous relationship with his Una-like/Duessa-like daughter helps explain Hawthorne's complex portrayal of Pearl in *The Scarlet Letter*. Many critics have shown that Una Hawthorne is the biographical source of Pearl, but they have not shown how associating Pearl with Spenser's Una and Duessa helps explain her allegorical function. My argument is that, through Pearl, Hawthorne integrates the allegorical function of Spenser's Una and Duessa and thereby comes to understand the duality of his daughter's true nature. To put it another way, Hawthorne gives Pearl both Una-like and Duessa-like traits. Within much of *The Scarlet Letter*, Hawthorne creates Pearl in the image of Duessa. For example, the narrator characterizes Pearl as an "airy sprite" (64), "evil spirit," "little elf" (67), and "a demon offspring" (165). Una Hawthorne's red hair also links her with Pearl as the personification of the scarlet letter ("[Pearl] was the scarlet letter in another form, the scarlet letter endowed with life" 70). As the perfect representation of the scarlet letter, Pearl is arrayed in a crimson velvet tunic of a peculiar cut, embroidered with fantasies and flourishes of gold thread (*Scarlet Letter* 70). Pearl's clothes are fanciful, decorative, gorgeous dresses and robes of the richest tissues (62-63). Hawthorne envisioned Pearl almost identically to Spenser's description of Duessa. Dressed in scarlet red, Duessa is decorated with "gold and pearle of rich assay and wears a Persian mitre on her head garnished with crownes and brooches" (I.ii.13, Spenser 23). Duessa hides herself behind the appearance of the innocent and pure Una to lead Redcrosse to carnal and spiritual sin. Duessa's sinfulness, seductiveness, independence, complexity, ugliness, aggressiveness, and strength are concealed within the external appearance of Una's innocence, purity, vulnerability, simplicity, beauty, femininity, and frailty. In *The Faerie Queene*, the outward appearance of Una as a domestic angel hides Duessa's monster within her. This monstrousness is most evident in Pearl's "wild, desperate, defiant mood, the flightiness of her temper, and even some of the very cloud-shapes of gloom and despondency that had brooded in her heart" (*Scarlet Letter* 63).

However, in *The Scarlet Letter*, Pearl also possesses characteristics of Spenser's Una. As a hidden angel, Pearl is "a lovely and immortal flower . . . worthy to have been brought forth in Eden; worthy to have been left there, to be the plaything of the angels, after the world's first parents were driven out" (*Scarlet Letter* 62). As an "infant princess," Pearl possesses a native grace and faultless beauty (63, 62). Pearl's rich and luxuriant beauty permeates through her bright complexion, intense and glowing eyes and deep, glossy brown hair that darkens to blackness as she grows older (70). Complementing her beauty, Pearl's feminine laughter rings with merriment and music (64). According to critic Julian Hawthorne, the opposite poles of being, sin and innocence, are mingled in Pearl's nature (*Faust* 83). True human nature appears to be a melding of masculine and feminine. My research has shown that, in literary genres, true human nature is often represented by the coexistence of the monster and the domestic angel. Therefore, the duality of Pearl's nature represents both the doubleness and deceit of Duessa and the truth of Spenser's Una.

Thus, Pearl also represents truth as shown by critic Claudia Johnson. Johnson writes, "Pearl is the hardest truth-sayer in the novel. Not only does she speak the truth, but she pursues the truth. The scarlet letter, which Pearl embodies, is also a totality of truth about human nature and relationships" (6). To advance her argument, Johnson points out that Pearl recognizes the deceit and evil of Chillingworth; he is the devil or the "Black Man" who has hold of Dimmesdale (6, *Scarlet Letter* 93). Furthermore, Pearl deduces that Dimmesdale holds his hand over his heart for the same reason that her mother wears the scarlet letter (Johnson 6, *Scarlet Letter* 122).

Johnson sets forth evidence of Pearl's search for the true meaning of the scarlet letter. When her mother lies to her about the letter's significance, Pearl persistently questions her (6, *Scarlet Letter* 123-124). Pearl senses that the truth of the letter lies in the public joining of hands between her, her mother and Dimmesdale (Johnson 6, *Scarlet Letter* 105). Unveiling his own scarlet letter, Dimmesdale shatters the illusion of his saintliness and acknowledges the moral truth of his sinfulness and passion through his public confession. Finally, Dimmesdale and the community recognize Dimmesdale as Hester's lover and Pearl's father. Thus, Pearl's kiss on her father's lips transforms her from being either monster or angel; it frees her into being a little girl. As her tears fall on her father's cheek, they signify the human joy and sorrow of a woman (Johnson 6, *Scarlet Letter* 173). Johnson concludes that the duality of true human nature means that we all wear a scarlet letter (19).

Thus, to understand the duality of his daughter's true human nature, Hawthorne had to integrate the allegorical extremes of Spenser's Una and Duessa. Hawthorne had to come out of the world of faeries, magic, symbols, ideals, moral extremes, and simplicity to find the truth of reality. Hawthorne realized that life presents a mixture of sin and innocence, ugliness and beauty to form a balance of independence and domesticity. Therefore, Hawthorne was eventually able to look beyond his daughter as the ideal Spenserian daughter to see her and love her as his true daughter, red hair and all.

In 1930 the "Twelve Southerners" published *I'll Take My Stand: The South and the Agrarian Tradition*, a collection of essays defending Southern traditions and culture against what the authors felt to be intrusive and exploitative Northern industrial capitalism. Most of the twelve Southern Agrarians, including John Crowe Ransom, Allen Tate, Donald Davidson, Andrew Lytle, Robert Penn Warren, and Frank Owsley, were associated with Vanderbilt University in some way, either as students or as faculty. The twelve men fought against industrialization's grave potential to reshape the South and undermine its traditions. Adopting "Northern" industrialization and its consumptive, isolating, competitive ideologies, they feared, would endanger their "simple" Southern lifestyles marked by kindliness, cooperation, and leisurely pursuit of culture (Santmyer 13).

Contemporary essayist, poet, and Kentucky farmer, Wendell Berry echoes many of the Twelve Southerners' arguments against industrialization within his own writings. Common themes between Wendell Berry's writing and the earlier Southern Agrarians are most evident within the works of Andrew Lytle, also a farmer. As agrarian critics, Berry and Lytle both call for practicable, small scale farming as an alternative to industrialism, emphasize the value of work, and illustrate nature's binding of God and man within their writing. Ultimately, though, the following discussion will show that Lytle and Berry write from very different perspectives. Lytle defends the rural South primarily because it offers a last remaining seedbed for the *human* institutions he holds dear. The farm, for Lytle, is a place offering an organic, ordered society in which families are supportive, religion remains unifying and in tact, and in which every participant has a place within the hierarchy. Berry, on the other hand, defends a rural--not necessarily Southern--existence primarily because he believes it offers a life in harmony with the land and its *natural* cycles. Thus, while the Twelve Southerners and their 1930s Agrarian movement are often regarded as *the* definitive Agrarian defense, a closer look at the variant voices within the movement, as well as the contributors' motivations for writing *I'll Take My Stand*, suggests that Wendell Berry aims to offer the more literal, practical, and ecological defense of farming as a way of life.

I'll Take My Stand: The South and the Agrarian Tradition was published in 1930, the outcome of a "Southern symposium of prose" which Allen Tate and John Crowe Ransom had been planning since 1927 (Rubin 197). *I'll Take My Stand*'s "Statement of Principles" written by John Crowe Ransom identifies broadly the Agrarians' purpose in publishing their manifesto. It stresses their mistrust of modern America's ever-increasing industrialism. They hoped to warn their fellow Southerners of the dangers of the "Northern way" of unchecked industrialism and of sacrificing their region's unique cultural heritage to become part of a homogenous, industrialized nation.

Undeniably, the Twelve Southerners were united in their distaste for industrialism and in their hope to preserve what they felt were distinctively *Southern* ideals. Yet just what the Twelve Southerners were *advocating* as an alternative to the Northern industrial mentality is less clear. The twelve essays included in *I'll Take My Stand* vary greatly. Topics range from Stark Young's accolades for the Old South plantation aristocracy to Andrew Lytle's celebration of the yeoman farmer, and from Allen Tate's discussion of the state of Southern Religion to Robert Penn Warren's controversial prescription for Southern race relations. Because such diverse cultural and humanistic themes are far more common than economic ones, critics such as Louis D. Rubin, Jr. argue that *I'll Take My Stand* fails to offer a unified, realistic defense of a practical agricultural economy (Rubin 228).

Clearly, for Robert Penn Warren and Allen Tate, the agrarian movement *was* far more a call for the preservation of Southern ideals than a hope for a literal return to a South of subsistence farmers. For Tate and Warren, even from the earliest stages of the movement, the farm represented a metaphor, a means of embodying the values present in an anti-industrial lifestyle. Tate and Warren were so adamantly against *I'll Take My Stand: The South and the Agrarian Tradition*'s being labeled *only* as an agrarian text that they fought against the title; they feared linking their book so closely to agrarianism would obscure their real aims in publishing it. Tate preferred calling the book a "defense of religious humanism" (Ransom et al. xxxiv), while Warren, who thought the title "I'll Take My Stand," from a line in the Southern hymn, "Dixie," was a "goddamned outrage," pushed to name the book, "Tracts Against Communism" (Lucas 21). Later, Tate was so angered when the book went to press with the present title in place that he wrote a scathing note to the others:

> It is over now. Your title triumphs. And I observe that Alexander [a writer with the Nashville *Tennessean*] today on the basis of the title defines our aims as an "agrarian revival" and reduces our real aims to nonsense. These are, of course, an agrarian revival in the full sense, but by not making our appeal through the title to ideas, we are at the mercy of all the Alexanders--for they need only to draw portraits of us plowing or cleaning the spring to make hash of us before we get a hearing. (Santmyer 21)

Tate was skeptical of the project's success "in the practical sense" (Rubin 228) but felt that the movement's real merit was its humanistic affirmation. In a letter to Davidson, Tate wrote:

> You evidently believe agrarianism was a failure; I think it was and *is* a very great success, but then I never expected it to have any political influence. It is a reaffirmation of the humane tradition, and to reaffirm that is an end in itself. (Rubin 230)

Donald Davidson, however, *had* hoped that the Agrarian movement would be more than merely an affirmation of ideals; he hoped for a literal resurgence of Southern agriculture. Unlike Tate and Warren, who feared being linked to images of the plow, Donald Davidson and Andrew Lytle, in particular, *were* sincere in their defense of the practicality of subsistence agriculture in the initial stages of the Agrarian movement. For them, the farm represented not merely a metaphor for Southern culture, but a legitimate means of economic independence and prosperity. Lytle's *I'll Take My Stand* essay, "The Hind Tit," is the most agrarian of all the essays in its detailing the simple, moral existence of a yeoman farmer free of industrial gadgets. Accordingly, Mark Lucas, author of *The Southern Vision of Andrew Lytle*, calls the author's tone in "The Hind Tit" not that of a "disinterested type-writer agrarian, but of a fiercely loyal southern farmer" (23).

Yet even Andrew Lytle, who returned to the South to live and farm his family's land until his death in 1995 at the age of ninety-two, and whose essay was perhaps the *most* agrarian of the agrarian essays in *I'll Take My Stand*, eventually agreed that the term "agrarian" had been too limiting for the group's purposes and admitted that he had romanticized the ideal of the yeoman farmer as a "kind of literary exercise" (Purdy 214-5). Further, in an interview for a 1952 issue of *Shenandoah* magazine, Lytle admitted that the "agrarians made a tactical error in allowing the word agrarian . . . to stand for their protest" (*Shenandoah* 31).

Lytle's retrospective comments on the agrarian movement suggest that he eventually acknowledged the twelve men's efforts as a defense of Southern religion rather than a narrowly defined defense of farming itself. Still, Lytle's decision to remain in the South in order to farm while all the other Agrarians accepted Northern university positions illustrates that his push for small-scale agriculture--regardless of the degree to which it may have been mixed with humanistic motivations--was, indeed, literal and sincere.

Indeed, many common themes are evident within Berry's and Lytle's writing. Berry and Lytle each affirm the significance of small farms where families own just enough land for subsistence, free from the restricting forces of industrial, "agribusiness" techniques. Lytle proposes the ideal size of a family farm as one "not so large that [the farmer] cannot know the fields intimately, nor so small that he will fear want" (Lytle 37).

Also, as a means of countering modern society's materialism and devaluation of labor, Berry and Lytle praise the farm as a place where work is spiritually uplifting as well as valued and varied. The farm provides a haven away from the "the spiritual sterilization" of monotonous jobs faced by factory workers in urban areas (Lytle 40-41). Lytle and Berry's criticisms of industrial agriculture often invoke a similar rhetoric as well. In "The Hind Tit," Lytle claims modern agriculture's biggest challenge will be getting its farmers to think in terms of, and place value on, a non-absolute such as time, rather than the absolute of land. Berry also regrets the results of such an artificial value system, criticizing American farmer's adoption of the country's industrial mindset in managing their farms in pursuit of short-term efficiency, immediate monetary gain, and ease, rather than in search of a healthy stewardship with the land (*Unsettling* 32). Both Lytle and Berry dismiss the applicability of an industrial perspective--bent on precision, quantity, and technology--to agricultural, biological processes.

As critics of modern society, both men allude to humans having usurped their proper role in the Great Chain of Being. Berry claims that humans have placed "the human will in charge of itself and of the universe" (*Unsettling* 55). Lytle echoes such sentiments in his attack against "the gradual displacement of God by man" wherein mankind has been left with only an ineffectual science to solve its problems (Lytle 189). Both men see farming as one of the few remaining ways of life which can counter modern society's anthropomorphism. Berry attributes his awareness that "little of the beauty and the richness of the world is of human origin" to his intimacy with the land as a farmer (*Recollected* 52). For both men, farming offers a re-emphasis of humans' place in the continuum of Creation.

Yet while both men merit the land's role in fostering religion, religious perspectives between Lytle and Berry differ greatly. In fact, the authors' differing religious perspectives offer one insight into their larger divergence in motivations for supporting an agrarian lifestyle. Ultimately, Berry's and Lytle's varying views of religion, history, and ecology overshadow their agrarian similarities.

Any discussion of Berry's sense of religion begins and ends with the land. Berry distrusts formal religion and uses the term more loosely to define the relationship between man, creation (often in specific terms of the land), and the Creator. Berry is "uneasy" with organized religion's tendency to dismiss the importance of existence on the earth in its pursuit of Heaven. Berry's Christian ideal is based in nature, rather than in an other-worldly Heaven.

Unlike Berry, Lytle was a strict adherent to formal, Christian religion. Lytle's fundamentalist Episcopal views pervade his works and are inherent in his attack against the evils in the fall of "Christendom." Lytle's religious conservatism is complex but emanates primarily from his European consciousness. In Lytle's thinking, a Christianity free from modern debaucheries and embodying Christianity's central force, the family, is the South's one remaining cultural tie to its "true," European, pre-industrial heritage (Lytle 164). According to Lytle, the South has "to go back" to a time when "the King was God's secular overseer, the bishop His spiritual," "before the days when Christendom was rent"; only such a return, he feels, would provide the world with order (Lytle 182-3). For Lytle, then, the South represents a region fighting against not only Northern industrialism, but more importantly, Northern secularism.

Lytle believes that pure Christianity has a "structure [which] . . . bound all men together, from king to peasant"; he advocates farming, therefore, as an alternative to what he sees as the increasingly de-structuring, de-ordering forces of industrialism. Specifically, Lytle's uneasiness with modernity is closely connected to industrialism's destruction of traditional class hierarchies. Lytle praises Christendom's ability to give each man a place, from king to peasant, where his work was necessary. Such a Christian, ordered society, he believes, exists in the rural South.

So, for Lytle, the farm represents a means of *placing* people. From this perspective, part of rural agriculture's value is its providing a system of order--albeit a hierarchical one--in which every person fulfills a distinctive role. Lytle praises the farm's role in providing an ordering buffer against Northern capitalistic and bureaucratic influences, as well. Agriculture becomes a means of "slowing down the process of central power" so long as small farmers are "distributed . . . sufficiently over the state" (Purdy 214-5). The livelihood farmer battled government bureaucracy and economic dependence by providing for his own needs.

The "health" implicit in Lytle's idealization of the small farm exits, then, in so far as it preserves the health of *human* institutions. For Lytle, the strengths of farming are its preservation of the family and religious and social structures dating back to the origins of Western civilization, as well as its providing economic and political independence from a national government he deemed oppressive. In contrast, organized religion, government, and social class--though defining themes for Lytle--are subordinate points in Berry's agrarianism which is defined much more by a respect for *natural* cycles.

Berry writes frequently of the complex ties within which every person lives his or her life. Humans are tied to their place, to their ancestors, and to their progeny. It is this "complex inheritance" which intrigues Berry so much (*Recollected* 74). In marked contrast to Lytle's definition of "place" as a means of social order, for Berry, one's "place" becomes a deeply-felt

BEST COPY AVAILABLE

identification with his or her home, family, and personal historical inheritance. Lytle's sense of history is one of large-scale, institutional declines; Berry's historical sensitivity, on the other hand, is more local, more personal, and more dependent upon a basis in the *land* than in social institutions. Berry's realization that he follows in the successes and failures of his ancestors, and that his own successes and failures will form the world his children will inherit, shapes in his work a search for an ecology, a connection to the natural cycles of death and rebirth, and a sense of responsibility:

> Each of us is a part of a succession. I have come here following Curran Matthews. Who was here or what was done before he came, I do not know . . . I do not know who will follow me. These realizations are both aesthetic and moral; they clear the eyes and prescribe an obligation. (Berry, *Recollected* 46)

Berry acknowledges that individuals cannot leave the world without having made it either better or worse for their existence. The desire to leave a better world--and proposals for *practical* means of doing it--form the basis of Berry's agrarianism. For Berry, agrarianism represents a life beautifully in touch with natural cycles, a life which is ecologically sound. Unlike Lytle's agrarianism which centered on man-made ideas and institutions, Berry centers on the natural cycles of death and life. By participating in the "Wheel of Life" in planting and reaping his fields, the farmer is reminded of his *own* participation in a wider succession of deaths and rebirths. Berry's poetry offers frequent and powerful images of such a life founded upon one's *return* to the land (*Recollected* 85-86).

Berry's agriculture, then, far from the metaphoric or socially-centered agrarianism of the Twelve Southerners, calls for a literal, practical return to subsistence agriculture. While Tate feared being depicted behind the plow, Berry *fosters* such an image of himself as a farmer in tune with the land. In effect, Berry is "a man born to farming":

> The grower of trees, the gardener, the man born to farming,/whose hands reach into the ground and sprout,/to him the soil is a divine drug./ He enters into death yearly, and comes back rejoicing. . . . (Berry, "The Man Born To Farming," *Collected Poems*, 103)

As a man who rejoices in farming, Berry writes to provide suggestions for means to preserve the health of the land, the farming community, and the farmer himself. Berry focuses much of his writing in suggesting alternative or organic agricultural methods which can both aid in the health of the land and still be financially feasible.

The difficulty in determining affordable, practical answers to agricultural problems, according to Berry, is the complexity of finding solutions which solve for the problem as a whole, or at its roots, rather than merely covering one of its manifestations. To find *true* solutions, Berry insists that many questions must be asked. Among the most important is: How to use the land well? (*Gift* 106) Other necessary questions include considerations of proper scale, balance, diversity, and quality in agriculture (*Gift* 122). Significantly, Berry, unlike many fundamentalist ecologists, does not believe that most land should be sanctioned off, and preserved from human use. Rather, the land should be used *well*. Similarly, tools should be used *well*. By asking his readers to truly consider the added benefit of an electric scythe over a hand-held, well-crafted blade (*Gift* 173) or the necessity of using tractors in cases where horse-drawn wagons would be more efficient (*Gift* 190), he challenges society as a whole to become a more conscious, beneficial contributor to the pattern of health that includes all Creation.

Still, the all-important question of practicality remains. While Berry claims he seeks practical solutions, it may well be that modern agricultural procedures have come too far in their dependence on large-scale, chemically based farming to turn back. Statistics from the United States Department of Agriculture seem to suggest that America's trend toward fewer, large-scale industrial farms and away from multiple small-farm operations has pushed ahead steadily since 1930 and will likely continue. While there were roughly thirteen million American workers employed on approximately seven million acres of farmland in 1935, by 1990 those numbers had dropped to three million workers on two million acres of farmland (USDA, fl_frmwk.htm). Additionally, the number of farmers who depend on outside jobs to supplement their income is increasing rapidly. In Kentucky, according to the 1992 census, of the state's farmers, forty-one percent worked at least two hundred days off the farm. In essence, Berry's ideals for small-scale agriculture simply are not feasible for most farming families today.

Yet that his values have not been widely adopted by the larger community should not dismiss Wendell Berry's aesthetic and moral value. As Berry himself admits, the morality inherent in his message stems primarily in the questions he asks and challenges he raises, rather than in their answers:

> After more than thirty years I have at last arrived at the candor necessary to stand on this part of the earth that is so full of my own history and so much damaged by it, and ask: What is this place? What is in it? What is its nature? How should men live it in? What must I do? I have not found the answers, though I believe that in partial and fragmentary ways they have begun to come to me. But the questions are more important than their answers. In the final sense, they *have* no answers. . . . They are a part of the necessary enactment of humility, teaching a man what his importance is, what his responsibility is, and what his place is, both on the earth and in the order of things. (Berry, *Recollected* 101)

It is Berry's persistence in asking the questions which "must be asked" (*Recollected* 101) and in developing an ecological perspective encompassing the health of the farm and rural communities--as *well* as the land on which they survive--which enriches his agrarian views in comparison to the Twelve Southerners' agrarianism. Berry pursues practical solutions; yet always, even in failing, his search offers a "moral and aesthetic" vision--founded upon respect for the land and for one another--which provides an alternative to modern society's excessive industrialization, materialism, and isolation.

Margaret Fuller's *Woman in the Nineteenth Century*: An Appeal for the Inclusive Self

Faculty Adviser:

Sara McAlpin, BVM, Ph.D.

"There is but one law for souls," writes Margaret Fuller, one of America's earliest and most vocal feminists. Fuller, an influential transcendentalist and advocate of equal rights for all people, lived from 1810 to 1850. During her lifetime, she produced writings that brought to light a variety of social issues; prominent among them was the rights of women. As a champion of women's rights, she challenged American society with her radical ideas concerning the equality of the sexes, particularly with the 1845 publication of her book *Woman in the Nineteenth Century*. In her writings, she strove to uncover an all-inclusive individual, a whole person encompassing both masculine and feminine traits.

Sarah Margaret Fuller was born to Timothy and Margarett Crane Fuller in Cambridge, Massachusetts in 1810. Timothy Fuller had wanted a son, a longing which would shape his daughter's life into something unheard of for the nineteenth century. A learned man, Timothy thought it important to teach his daughter as most male children would be taught, instilling in her the knowledge she would need to become an accomplished author, journalist and critic. Margaret, as she preferred to be called, learned history, literature, foreign languages and all subjects that were usually taught to boys but not girls.

Perhaps because of this unusual upbringing, Fuller gained a discerning perspective on certain issues. She states her thesis in the preface to her book: "I believe that the development of the one [man] cannot be effected without that of the other [woman]. My highest wish is that this truth should be distinctly and rationally apprehended, and the conditions of life and freedom recognized as the same for the daughters and the sons of time; twin exponents of a divine thought" (Fuller, *Portable* 229).

Fuller was a unique woman for her time, when women were viewed chiefly as domestic objects. They were not allowed to vote, therefore having no voice in matters that decided their paths. She, however, believed that a woman's freedom should be "acknowledged as a right, not yielded as a concession" (Fuller, *Portable* 244). When she began writing, she often investigated social issues and suggested reforms. Her androgynous perspective, acknowledging both masculine and feminine traits in herself, perhaps allowed her to view the issue of gender equality more objectively than many other people.

Her thinking not only included radical feminist ideas, but also the growing Transcendental perspectives of her day. She was such an integral part of this group, she even edited the transcendentalist journal, the *Dial*, for two years from 1840 until 1842.

Among her various contributions to the *Dial*, Fuller published the essay "The Great Lawsuit. Man Versus Men: Woman Versus Women" in July 1843, which she expanded into the full-length *Woman in the Nineteenth Century*. This book explores Fuller's feminist philosophy by detailing a number of examples of the ideal woman, a woman possessing both masculine and feminine qualities. These ideas were not widely accepted when first published.

Many thought Fuller was stepping beyond her "sphere" and were appalled to hear of a woman who thought that all creatures, regardless of gender, should be treated equally. Fuller asks for a common gender in words that spoke not only to women of the nineteenth century but also continue to speak to women of the twentieth century.

In her preface, she states that she is writing for both men and women, hoping to incite women to "search their own experience and intuitions for better, and fill up with fit materials the trenches that hedge them in." All that she requires of men is a "noble and earnest attention," to consider her ideas with an open mind (Fuller, Portable 229).

Fuller writes that from the beginning of time, humans have one soul and one body, and "the growth of Man is two-fold, masculine and feminine." Because of her vantage point, she knows the importance of both characteristics. "There cannot be a doubt that, if these two developments were in perfect harmony, they would correspond to and fulfill one another, like hemispheres, or the tenor and bass in music" (Fuller, Portable 326).

Believing that it is an essential truth that men and women should be part of the same sphere, Fuller tries to answer the query: why are women not regarded as equals? Man was developed first, and women were under the care of men. Men had the opportunity to teach women, but "as human nature goes not straight forward," men did not understand this opportunity, and therefore became the rulers over women instead of equal partners with them. Men were punished for this, because now instead of having an intellectual kindred with whom to share life, women were made into servants, and man "found himself a king without a queen." According to Fuller, man didn't recognize that woman was the other half of himself, and he could never achieve fulfillment while woman was not allowed to be fulfilled (Fuller, Portable 326).

Her sharp awareness of the dimensions of masculinity and femininity was, according to Jeffrey Steele, due to the influence she felt from both her father and mother. According to Steele, her "sense of gender duality led Fuller to define herself in bisexual terms. 'Will there never be a being to combine a man's mind and a woman's heart,' she once lamented," (xii). That question may have been posed by the mythical woman Fuller details in Woman in the Nineteenth Century. Her aim is to bring forth examples of the ideal woman, a woman not confined to a sphere, a whole woman who embodies ideal characteristics of both genders. Through these examples we learn what she believes a whole person is, one with an astute mind and a tender spirit. She struggled through her life to come to terms with her androgynous perspective. Through her writings, which grew out of her own struggle, she encouraged others who may have been attempting to understand what it means to be male or female. She writes, "Male and female represent the two sides of the great radical dualism. But, in fact, they are perpetually passing into one another. Fluid hardens to solid, solid rushes to fluid. There is no wholly masculine man, no purely feminine woman" (Fuller, Portable 293).

Her dual perspective enlightened her to perceive that "what woman needs is not as a woman to act or rule, but as a nature to grow, as an intellect to discern, as a soul to live freely and unimpeded, to unfold such powers as were given her when we left our common home" (Fuller, Portable 244). Encompassing everyone in this assertion, she says that all people come from the same place, our common home, and are created equally there. It is her wish that all people exercise their intrinsic powers and become whole persons, individuals with rights, not confined to any particular sphere.

Fuller believed she had some "masculine qualities-- a philosophical mind, love of learning, self-reliance, ambition, love of command," yet "she clearly saw the lot of women in her society: as childbearers, drudges, slaves, ornaments, bodiless ideals, superfluities," (Allen 135). It was this position of woman, this "sphere of her sex" that she chose not to accept. She compared women to slaves, in that they were not free, but were ruled by an unenlightened master: society. "Tremble not before the free man, but before the slave who has chains to break" (Fuller, Portable 260).

There were many who did not agree with Fuller's ideas, including both men and women. One of the most negative reviews of her works was written by Charles F. Briggs, and appeared in the *Broadway Journal* in March of 1845. In his vehement attack on Fuller's feminism, Briggs states:

> If there is anything clear in revealed and natural law, it is that man is the head of the woman. All the beauty, all the harmony, all the happiness of life is centred in this truth. The most perfect woman that the world has ever known, one who was tried as no other woman was ever tried, who was endowed by nature as few women have ever been endowed, the sweetest, purest being that ever bore the name woman, counted herself nothing but the wife of her husband, would know no law but his will, no happiness but his love; and when his love grew cold, and he became dead to her, though living, she still remained true to him (Myerson 10).

Briggs is reacting to Fuller's statements concerning women who think for themselves as any human being has the natural right to do. At that time, however, it is apparent that men believed women to be inferior, and Fuller is appealing to all people to become whole, embracing both genders.

On the other hand, Fuller's friend, John Neal, criticized her for not sufficiently inciting women to act on her ideas, to act by claiming their right to vote and participating in law-making. He said, "There is no life for woman, till she has a hand in making the law--no chance for her till her vote is worth as much as the man's vote. When it is, women will not be fobbed off with six pence a day for the very work a man would get a dollar for" (Von Mehren 198).

Fuller strove to break chains like these for other women, because she had already broken free through her education and awareness of the need for reform. Woman in the Nineteenth Century is an eloquent plea for an all-inclusive person, which would enable both men and women to live equally and harmoniously. She states that men must realize "that the idea of Man, however imperfectly brought out, has been far more so than that of Woman, that she, the other half of the same thought, the other chamber of the heart of life, needs now to take her turn in the full pulsation, and that improvement in the daughters will best aid in the reformation of the sons of this age" (Fuller, Portable 235). She says it is in society's best interests to give women the same rights as men. In 1845, that was a threatening thought for most men, and many women. Women had their realm, one which involved raising children, taking care of husbands and running the household. It was unheard of for women to write such ideas and publish them for the world to read. Fuller was criticized for not fulfilling the traditional role of wife and mother, since at the time of publication she was not married and had raised no family.

With Fuller's radical declarations, she was urging women to become "sea-captains," yet her pleas for equality would not be realized for years, and it is debatable whether they have been realized even today, on the eve of the third millennium. Women were not granted the right to vote until after World War I in 1920, though they had been working to gain that right since Fuller's time, when in 1848 in Seneca Falls, New York, the first suffragists gathered to unite and fight for their voice. Like Fuller, women today wish for woman to accept no placement, to grow as a whole being, and to obtain equality. Her ideas can serve as an axiom for feminists in the late twentieth century, or more appropriately, for humanists, individuals who recognize the worth of all people regardless of differences.

By articulating her integrated perspective, Fuller presented her truth to an 1845 audience. Her most triumphant work was behind her. She had put into writing the strong ideas and emotions she harbored on the subject of woman. The book was the culmination of years of internal struggle, and having opened her spirit to set her thoughts free, only served to enhance her complete self. When she finished the book, she proclaimed in a note to her transcendentalist contemporary and friend, William Henry Channing: "I felt a delightful glow, as if I had put a good deal of my true life in it, and as if, should I go away now, the measure of my foot-print would be left on the earth" (Chevigny 217).

Fuller's foot-print is firmly embedded in American literature and thought, a mark which she established in a tragically short life. Shortly after Woman in the Nineteenth Century was published, Fuller traveled to Italy as a journalist in 1846. In 1847 she met and fell in love with the Italian revolutionary Giovanni Ossoli, and soon bore him a son, Angelo. When the family fled Italy to escape the Italian Revolution, they sailed for New York in 1850, only to have their ship wreck off the coast of Fire Island on July 19. Within sight of scavengers on the shore, Fuller, Ossoli and Angelo drowned (Blanchard 336, 337). In only 40 years, Fuller had written such inspiring words that her foot-print will remain a symbol to enkindle in women the desire for totality and inclusiveness, the strength of will to become open-minded and compassionate individuals, and the determination to actualize the full potential of all humans.

The Paradox of the Crucifixion Allegory in Ben Franklin's "The Kite Experiment"

Ben Franklin was a preeminent American philosopher, politician, and scientist during the Enlightenment. He was vocal about his belief in one God, which is a tenet of Deism, his religious creed. Consequently, it is surprising to find such a straightforward crucifixion allegory embedded in his essay "The Kite Experiment" (1752).

My presentation will focus on and compare details of the manifest (scientific) and latent (religious) aspects of "The Kite Experiment." My reading will illustrate the conflict between the Deism endorsed by the intelligentsia and the traditional Christianity that prevailed in the early republic. Although Franklin's allegory may have been an unintentional result on his part, it invites contemporary theoretical approaches such as deconstruction and reader-response criticism when interpreting the tensions informing it.

Americans have an identity crisis. Why shouldn't we? Expressions of free-thinking individuality are usually crushed by the conservative consensus. Paradoxically, this obliteration of individuality is necessary for retention of this consensus. Furthermore, a consensus is compulsory for society to determine its boundaries. These boundaries determine for whom and what we stand. For instance, Anne Hutchinson and Thomas Morton were two examples of individuals who were persecuted for the sin of remaining true to their essential selves. They were banished from society because they crossed the accepted boundaries of their colonial society. Hutchinson and Morton were intelligent, educated persons. However, if they'd been *more* resourceful, like Ben Franklin over 100 years later. It's possible they could have retained their places in society by assuming masks, or personas. These masks were necessary in order to survive in a society whose rules and boundaries were forever changing.

Apparently, Benjamin Franklin – American philosopher, politician, and scientist – found it necessary to invent multiple masks for himself as a form of survival in America's evolving society during the Enlightenment. He adopted more than thirty masks in various works. At times, he signed his work as a woman – Betty Diligent, Alice Addertongue, or Abigail Twitterfield. Many of his masks were puns – Fart-hing, Hugo Greim, or Anthony Afterwit. And many were just plain clever – Silence Dogood or Censor Morum, Esq.

Yet, even with this repertoire of voices and our knowledge that Ben Franklin was quite vocal about his belief in one God, which is a tenet of Deism (Franklin's religious creed), it is still surprising that there is a clear crucifixion allegory embedded in his essay, written in the year 1752, "The Kite Experiment." By signing his true name to this essay, Franklin essentially "masked" this allegory within the framework of the actual experiment. This effectively made the allegory less dangerous (for the reader and, more importantly, for Franklin himself).

The discovery of the crucifixion allegory in the Kite text is unexpected. Unexpected because a Deist such as, such as Franklin, would never consciously advance Christian Humanist propaganda. The crucifixion story is, of course, the heart – the foundation of the Christian Humanist belief system – the prevailing religious system of the early republic.

This Christian religion is based on divine faith and grace – on an unconditional belief in things unknown and unseen in this world. This Christian faith is born of spiritual, supernatural, miraculous experiences. For Christians, an ever-present, omniscient, all-powerful God created the universe. This all-seeing God was, and is, entirely responsible for the minute details which compose our lives. In his book, The Philosophy of the Enlightenment, Ernst Cassirer writes that the seventeenth-century French philosopher, Pascal, established a doctrine which further explains this Christian belief system. In his thesis, Pascal "defends ... the absolute powerlessness of reason which is incapable of any kind of certainty by its own efforts, and can arrive at the truth only by means of an unconditional surrender to faith" (Cassirer 142). Furthermore, Pascal believed that the contradictions of the duel nature of fallen man in a supposedly harmonious world are illuminated when we study actual life experiences. "Thus all standards of logical and rational knowledge are reversed. In this knowledge, the unknown is explained by reducing it to a known quantity" (143). In Pascal's words: "Be humble impotent reason; be quiet, imbecile nature: ... learn from your Master of our true condition, of which you are ignorant. Hearken unto God!" (144).

Pascal's seventeenth-century concept of the absolute authority of the traditional Christian God continues into the following century yet differs from the Deist God endorsed by the intelligentsia of the American Enlightenment. Specifically, as Cassirer says, "Deism begins as a strictly intellectualist system; its aim is to banish mysteries, miracles, and secrets from religion and to expose religion to the light of knowledge" (171). The conventional view of a Deist God is one of a watchmaker who makes the watch, and then sets it in motion. The Deist God doesn't interfere with this allegorical watch-world after its motion has started. According to the Deist belief system, man is no longer solely dependent on God's grace for survival – instead Enlightenment-independent man is now actively involved with shaping his destiny. During the Enlightenment, which is when Deism climaxed, it was paramount for man's survival to understand and master Nature – through scientific investigative methods of collecting information on observable reality. Reason was the illuminating focus of the Deists. And progress was their teleological goal. According to historian Peter Gay, in The Enlightenment (An Interpretation) : The Science of Freedom, science was at this time "one area of human experience in which progress was reliable" (124).

It appears that Benjamin Franklin "worked his was into deism by devouring the tracts of English controversialists and perfected his knowledge of modern science by studying the English Newtonians" (Gay 559). In fact, Franklin was as respected and admired in England as a philosopher, a politician, and a scientist as he was in America. His kite essay, written in 1752, is perhaps his most famous recorded scientific experiment.

Franklin wrote this essay believing that "it may be agreeable to the Curious to be inform'd" ("kite" 375). On the surface, this essay appears to be a simple description of a scientific experiment. However, upon closer reading, it is obvious that there is a easily identifiable allegory of Christ's crucifixion embedded within the text. This allegory is problematic because although Franklin was quite familiar with Christian theology, he had publicly (in at least one letter to Ezra Stiles) expressed his doubts of Christ's divinity. Furthermore, the paradox of this text is the apparent representative microcosm of the tensions which existed between the scientific and religious worlds during the Enlightenment. In my reading, these worlds transcend their oppositional boundaries to blend and become a sort of good will sermon for all mankind. In another letter to Joseph Huey, Franklin states a possible motive for this probably subconscious blending of opposing belief systems. He writes that the faith subscribed by Huey "has doubtless its uses in the world; [he did] not desire to see it diminished, nor would [he] endeavor to lesson it in any Man" ("Huey" 476). He wished instead for Christian faith to be more active and productive. Franklin's essay has greater depth with this crucifixion allegory – everything rational has a correspondence in the natural world. This makes the text more productive by reaching all mankind as an audience. As Franklin wrote to Mr. Huey, "Mankind are all of a Family" (476).

At the start of this essay, Franklin instructs the reader, "Make a small cross…." What's on this cross? More importantly, *who's* on this cross?

"… the [ARMS] so long…"
"… the [EXTREMITIES] of [or on] this cross…"
"… the [BODY]…"
"… a [FOOT] …"
"…next the [HAND]…"
"…the [FINGER]…"
"…the [KNUCKLE]…"

A conventional reading of these phrases is Franklin's description of a kite. However, I believe that the arms, the extremities, the body, the foot, the hand, the finger, and the knuckle belong to Christ on the cross. Let's take a closer look at these symbols.

Franklin's kite, literally, is flying towards the clouds. This kite is a conduit from the man to the clouds. According to J.E. Cirlot, in A Dictionary of Symbols, Gaston Bachelard believes "that a cloud should be taken as a symbolic messenger" (Cirlot 50). Furthermore, this "aspect of the cloud is symbolic of forms as phenomena and appearance always in a state of metamorphosis, which obscure the immutable quality of higher truth" (50). So, the kite is a conduit to a higher truth – much like the Christian belief that only through Jesus can man attain the ultimate higher truth – God. In this way, Franklin's kite is an allegory for Christ.

The properties of this kite have symbolic meaning, also. Franklin instructs the reader that the kite is *not* made of paper because paper would not hold up as well as silk. Paper, as we know it, didn't come along until the fifteenth-century. All sacred Jewish texts were written on parchment – probably the Bible was was first recorded on this material. It's interesting that parchment was often made from sheepskins. Following this line of thought, the paper kite is an allegory for the weak lambs of the Lord – mankind. Jesus, was the shepherd to these sheep. Franklin's kite, instead, is made of silk – the strongest natural fiber. Silk fibers can be stretched (or abused), yet still these fibers will return to their original shape. In a similar vein, Jesus can be tortured and stretched on the cross to die, then according to the story, his restored body will resurrect in three days and then rise to heaven. With this in mind, Franklin's kite *had* to be made of durable silk to withstand the Kite essay's "Wet and Wind of a Thunder Gust>"

According to Cirlot, again, the value of wetness "...may be positive on the plane of natural life, it has an entirely negative effect on spiritual life" (Cirlot 370). An active wind means "regeneration" (373). The Thunder Gust, or thunder bolt "destroys all material forms." its purpose if top keep man down, away from a "higher world" (342). In this way, the "Wet and Wind of a Thunder Gust" is an allegory for the torture of Jesus' final three dark hours on the cross. Specifically, if Christ, during this time had succumbed to Satan's temptation to renounce God, he would have been kept down from the ultimate higher world of heaven. But, because he was strong and durable (as silk), he rose to heaven in his original shape.

The references, in this essay, to loops, strings, ribbons, and twine are obviously bindings. Franklin's kite was bound on crossed sticks. Christ, as we know, was bound on the cross. Specifically, the silk ribbon and the heavy, rough twine join – for the Key. This joining is symbolic of the embodiment, in Christ, of his divine and the human qualities. Furthermore, the silk ribbon will remain dry in the safe cover of a door or window, but special care must be given to ensure that the twine does not touch the "Frame of the Door or Window." The divine, in other words, is protected – while special care must be given to the weaker twine. The door and window are safe havens for the divine. For the weaker human element. They are "framed" as a potential means of escape – perhaps symbolizing temptation.

The Key for which these bindings join is the archetypal key – the "key of Eternal Life that opens up the gates of death on to immortality" (167). The key needs fire from above to unlock the gates to heaven.

The purpose of the kite is to attract "Electric Fire." Symbolically, there is a "parallel between fire and life, ...both must feed upon other lives in order to keep alive" (106). In this paradoxical way, Jesus died so that mankind could live. Additionally,

> Karl Jung comments that in some traditions the cross is a symbol of fire and of the sufferings of existence, and that this may be due to the fact that the two arms were associated with the kindling sticks which primitive man rubbed together to produce fire. (69-70)

According to Franklin's essay, when the Key has been "charg'd" and the Electric Fire has been "obtain'd," then, "Spirits may be kindled" with the help of a "Glass Globe" (the world). What are the results of this experiment? That "the Sameness of the Electric Matter with that of Lightening [be] completely demonstrated." This is another way of highlighting the relationship of man-made "fire," science, with natural "fire," religion.

Franklin's allegory may have been an unintentional result on his part. On the surface, this is a simple process essay. However, clearly he has the reader look at the hand on the cross – then, he narrows the focus to the finger – then, in increasingly sharper focus, he has the finger point (at the knuckle) to the text. Franklin's words literally tell the reader to look closely at the text. The resulting tension of rationalism and spiritualism subverts and illuminates this text. If Franklin's aim was to unify mankind, then indeed, in this Kite text, he accomplished a fusion of the major oppositional concerns of the Enlightenment – science and religion. Can we assign authenticity to this reading of Franklin's text? Philosopher Mercia Eliade asserts:

> two points of view are only superficially irreconcilable..., for it must not be thought that a symbolic connotation annuls the material and specific validity of an object or action. Symbolism adds a new value to an object or an act, without thereby, violating its immediate or "historical" validity. (Cirlot xiv)

Like Eliade, I believe that the paradox in this text makes it *more* exciting and adds *more* depth – yet, in no way does it deter from conventional, historical interpretations. Furthermore, I've read other Franklin essays with similar word choices, but not similar patterns of an underlying crucifixion message. Because Franklin was deeply versed in Presbyterian theology, this implies that his word choices were deliberate. Therefore, I believe that "The Kite Essay" is a "special case" of an Enlightened man illustrating a striving – consciously or subconsciously – for balance in the decidedly unbalanced world of the American identity crisis.

The Doorway to Wildness: Four Poems by Muriel Rukeyser and Adrienne Rich

In Women who Run With the Wolves, Clarissa Pinkola Estés writes of the Wild Woman, the "force which funds all females" (8). According to Pinkola Estés, the Wild Woman is the innate source of women's creativity, strength, and harmony. She theorizes that, through socialization and domestication, women have become separated from their wilder selves. She writes:

> I call her Wild Woman, for those very words, wild and woman, create llamar o tocar a la puerta, the fairy-tale knock at the door of the deep female psyche. Llamar o tocar a la puerta means literally to play upon the instrument of the name in order to open a door. It means using words that summon up the opening of a passageway. (6)

This summoning of a door comes when a written or spoken word, line, or story is "so resonant, so right, it causes us to remember, at least for an instant, what substance we are really made from, and where is our true home" (7).

Four poems by Muriel Rukeyser and Adrienne Rich operate as llamar o tocar a la puerta by demonstrating for the reader the steps necessary in rediscovering the Wild Woman. Rich's "Diving into the Wreck" and "Integrity" and Rukeyser's "The Poem as Mask" and "The Speed of Darkness" illustrate the steps a woman must complete to regain contact with her wilder self. Pinkola Estés outlines these steps in the course of her book. First, a woman prepares for her journey. Then, she descends through her self, past the socializations and restrictive standards placed upon her by patriarchal society. Once she has cleared this wreckage, she explores what she has found. Through this exploration, she experiences a revelation or personal change. Finally, she returns to the outer world and lives with her new knowledge.

Of the four poems, Rich's "Diving into the Wreck" most explicitly demonstrates Pinkola Estés' five steps. The poem's narrative directly parallels these steps. On a literal level, "Diving" describes a woman scuba diving. The poem begins with her preparation for the journey:

> First having read the book of myths,
> and loaded the camera,
> and checked the edge of the knife blade,
> I put on
> the body-armor of black rubber
> the absurd flippers
> the grave and awkward mask. (1-7)

Rich, as the poet and as the speaker, has familiarized herself with myths surrounding gender and status, suggesting she recognizes the parts of her self which have been imposed upon her by patriarchal society. She must find the parts which are real.

Rich also prepares by bringing objects which are not instrumental to her movement or her physical survival. She brings a camera, suggesting she begins the journey with the goal of recording it for others. She intends to return and share her new knowledge; like the poem itself, her journey begins with the objective of communication. The knife, however, implies that the journey she makes will be dangerous. Rich writes, "It's exhilarating to be alive in a time of awakening consciousness; it can also be confusing, disorienting, and painful" (On Lies 34). A woman who searches for her Wild Woman runs the risk of becoming whole but socially unacceptable. She also risks uncovering parts of her self which she is not ready to recognize or accept. Rich knows a journey into consciousness can be dangerous, and she illustrates that in the preparatory stages of the poem.

"Diving" uses an evocative metaphor which incorporates the idea of the second stage, descent. Rich literally descends from the schooner, first down a ladder and then through the water. She crawls "like an insect down the ladder," suggesting the awkwardness with which she proceeds (30). With no one to instruct her, she must learn on her own through trial and error. Rich reveals her apprehension; " . . . there is no one / to tell me when the ocean / will begin" (31-33). Her statement suggests that she wants someone to tell her what to expect, but although she is fully equipped with others' ideas, she must continue her journey alone (Keyes 152). Rich's statement suggests the solitary nature of an exploration of the self and reiterates the possible danger which she prepared for earlier in the poem.

In the third step in "Diving," Rich explores the wreck, which can represent her past, her subconscious, and Western culture (Martin 189):

> I came to explore the wreck.
> The words are purposes.
> The words are maps.
> I came to see the damage that was done
> and the treasures that prevail. (52-56)

Her first goal is to assess the damage which was done to her while living under masculine control. The myths she read in preparation for the journey now reappear as a guiding force as she learns about herself. The words are "purposes" and "maps," stressing the importance of language and the need for communication. This relates back to the camera at the beginning of the poem. As she observes the damage, Rich prepares to pass her experience on to others; the references to communication connect to stress the need for shared knowledge.

Rich's second goal in her exploration is to salvage herself. She, as the speaker of the poem, must sift through her experience to find her identity as a woman. " . . . This drive to self-knowledge, for women, is more than a search for identity: it is a part of our refusal of the self-destructiveness of male-dominated society" (Rich, On Lies 35). The treasures she will salvage "prevail," suggesting that they exist in an important part of every woman, and that they will prove more powerful than the masculine influence. The word "treasures" implies that she will find an immense wealth when she develops her identity; her identity as a whole woman is valuable. This process of salvaging is necessary before she can, in a revelation, develop a new identity. She has achieved this step through realizing which parts of her are not her own.

Rich experiences a physical transformation in "Diving." When she enters the fourth stage of revelation, she becomes the objects she sees. She becomes "the mermaid whose dark hair / streams black, the merman in his armored body," "he / whose drowned face sleeps with open eyes," and the wreck's "half-destroyed instruments" (72-73, 77-78, 83). She has identified and acknowledged all of the dissimilar, contradictory, and complex details which comprise her true self. Her preparatory reading of the "book of myths" has given her the knowledge she needs to experience this transformation. In learning what society has imposed upon her, she is able to focus on any fragment she finds which has not been predetermined by masculine influence. Focusing on such a fragment results in her revelation. This union between the speaker and the wreck in the revelation suggests not only the unification of multiple interior selves, but the possibility for other women to experience the same union (Ostriker, Stealing 203).

After experiencing such a revelation, Rich must return to the rest of the world to live anew. However, Rich's poems "are, by their nature, more about method, about preparing oneself, about 'the will to change' than they are visions of a final resting place" (Kalstone 156). "Diving" ends:

We are, I am, you are
by cowardice or courage
the one who find our way
back to this scene
carrying a knife, a camera
a book of myths
in which
our names do not appear. (87-94)

Rather than the final resting place, the reader sees potential in this poem; she will find her way "back to this scene" (90). Rich presents the potential for living a full, unfragmented life, rather than an idealized picture of that life. She forces the reader to conjure some of the poem's images, emphasizing the reader's role in the triad. Rich gives the reader an incentive to pursue her wilder self by giving a suggestion of the outcome. Here, she creates llamar o tocar a la puerta by enticing the reader's curiosity.

While "Diving" describes a woman scuba diving, "Integrity," in an extended simile, describes a woman who is somewhere in a northern wilderness, observing her surroundings as well as examining her self. In "Integrity," we see the speaker's contemplation of her self only through her contemplation of her surroundings; she hovers around the stages of exploration and revelation. She sees the objects around her, noticing light and color. "The light is critical," she says (15). She sees "The glitter of the shoal / depleting into shadow" (18-19). The "stand of pines" is "violet-black really, green in the old postcard" (20-21). She notices the difference between the image of the area which was handed to her on a postcard and the reality of the scene; this parallels women's realization that the picture given by patriarchal society is not necessarily a true picture of reality. The realization of the need for a new feminine truth is another key to finding the Wild Woman. The distinction between truths allows Rich to renounce her "obedience to the fathers and recognize that the world they have described is not the whole world" (Rich, On Lies 207). This rejection of patriarchal "truth" is imperative in uncovering the wild self.

In "Integrity," Rich does not travel back over the water to civilization, but she does leave the two stanzas of introspection to return to the observation of her surroundings. The poem ends with a description of the cabin, its interior, and its former occupants. She concludes the poem with the lines, " . . . critical light / imperceptibly scalding / the skin these hands will also salve" (56-58). The word "critical" suggests importance as well as criticism, combining differing meanings in one word. The image also implies that the sun which burns her is the same sun which gives her light by which to examine herself.

Much as the "critical light" both burned and illuminated the need for change in Rich, "The Poem as Mask" presents presents Muriel Rukeyser's examination of herself in critical light. "'The Poem as Mask' is a myth of self-healing based on the process of critique" (DuPlessis 294). The speaker experiences a revelation based upon her critique of her previous behavior. The poem begins:

When I wrote of the women in their dances and
   wildness, it was a mask,
on their mountain, gold-hunting, singing, in orgy,
it was a mask; when I wrote of the god,
fragmented, exiled from himself, his life, the
   love gone down with song,
it was myself, split open, unable to speak, in
   exile from myself. (1-5)

Rukeyser experiences a twofold revelation in this poem. She first realizes that while she has seemed wild, she has really been hiding behind a mask of wild appearances. Just as Rich put on body armor, flippers, and a mask to begin her journey, Rukeyser first experienced life behind the mask before becoming able to attempt a change. Similarly, most women live behind masks for much of their lives and must reject those masks as they discover their wilder selves.

Rukeyser then takes the step of rejecting the mask. Once she has recognized and named her creations as ones she made under the influence of the mask, she is able to take her first step toward change. In naming the mask, she becomes able to identify and fight it. She has made the step of identifying patriarchal intrusion. It is this step which gives her the power to cry out, "No more masks! No more mythologies!" and to conclude the poem, "Now, for the first time, the god lifts his hand, / the fragments join in me with their own music" (10-12). Like Rich, she has joined the fragments of herself. The lifting of the god's hand suggests the removal of patriarchal control; she breaks away from the habits of her past to form a new life.

Rukeyser's "The Speed of Darkness" is a thirteen part poem, each section of which conveys a different emotional state, from angry to fearful to resentful. She includes statements of belief about the working of the world, statements which seem to have been developed through the process of analyzing the different images she presents. In the poem, the speaker experiences several revelations.

The strongest revelation in the poem occurs in the third and fourth parts. They begin:

> 3
> Stillness during the war, the lake.
> The unmoving spruces.
> Glints over the water.
> Faces, voices. You are far away.
> A tree that trembles.
>
> I am the tree that trembles and trembles.
>
> 4
> After the lifting of the mist
> after the lift of the heavy rains
> the sky stands clear. (11-19)

By using war as a context for the poem, Rukeyser creates an immediate sense of foreboding and uneasiness, much like the uneasiness developed in "Diving into the Wreck." The speaker's trembling is a physical sign of an inner state of turmoil, one which needs to be changed.

The third section is composed in entirely endstopped lines. Most of these lines contain fragments of sentences. Together, they suggest Rukeyser's thoughts are incomplete and disconnected. At the same time, she is noticing the absence of someone far away. However, in the fourth section, she suddenly becomes able to form one complex thought which spans several lines and is much more cohesive in its content. Something has occurred between these two stanzas which has changed her entire thought process. According to Denise Levertov, poetry makes more use of space than prose does (60). In allowing a change to take place in the space between to stanzas, Rukeyser forces the reader to contemplate what may have happened, and how she may experience a parallel change. In the space between the stanzas, Rukeyser found a source of inner strength which has allowed to her exist fully without fear; she has found her Wild Woman.

A second revelation occurs through the relationships between words in the conclusion of the fourth section:

> I remember the buildings are space
> walled, to let space be used for living
> I mind this room is space
> this drinking glass is space
> whose boundary of glass
> lets me give you drink and space to drink
> your hand, my hand being space
> containing skies and constellations
> your face

> carries the reaches of air
> I know I am space
> my words are air. (21-32)

The second revelation can be seen in the progression of the meanings of the word "space." Its first use is an abstraction, suggesting only a place in which to live. Buildings are reduced to their space rather than their structure; the focus is on absence or emptiness. Then, Rukeyser shrinks the focus from a whole building to a single room, then from a room to a glass. The abstraction slowly solidifies. The boundaries of a building, walls, and glass enclose the space. But, after the glass "lets me give you drink and space to drink," the abstraction expands again. The idea of the hands as space containing constellations suggests limitlessness. The constellations also fill the spaces which were left empty in the earlier lines. In saying "I know I am space / my words are air," Rukeyser reflects back to the "reaches of air," and again suggests limitlessness. She takes the abstraction of space as a large area with a use down to a single point of focus, then allows it to open and encompass everything. This suggests that she has, in the course of this observation, realized her own limitless potential. The uses of the word "space" relate to each other and to the Wild Woman; Rukeyser's discovery of her limitless power is like the discovery of the Wild Woman.

Adrienne Rich and Muriel Rukeyser leave these poems as "a map for those who follow . . . " (Pinkola Estés 15). They leave examples of Pinkola Estés' five steps to finding the Wild Woman as well as evocative descriptions of individual revelations. Their creation of llamar o tocar a la puerta through these descriptions gives the reader both the means and the incentive to search for her own Wild Woman.

The Relationship Between Cognitive Growth, Journal Writing, and the Development of Critical Thinking

Larry Nichols

Psychology research in the area of cognition shows a transition from concrete to abstract thinking that occurs in late adolescence. A new college student questions old ways, values, and patterns; these questions are a central part of their identity formation process. This shift to abstract thinking manifests itself in authentic and mature writing that demonstrates critical thinking. By researching the cognitive stages and investigating different journaling techniques, we will show that journaling encourages identity exploration and facilitates cognitive growth. In the footsteps of Piaget, we assert that knowledge of cognitive development in late adolescence should impact curriculum. If this cognitive shift is more fully understood, then educators can create curriculum to foster students' critical thinking skills.

The shift from concrete to formal operations, as defined by Piaget, is important because full formal operations enable adolescents to think abstractly. This cognitive transition is significant because it is a prerequisite for writing with authenticity -- an authenticity that demonstrates critical thinking and personal struggle with a topic. How do educators in any capacity encourage the growth of formal operations in new college students and thus foster critical thinking skills? Journal writing is a practical avenue for personal expression that shows students the connection between writing and thinking. Journaling is simply writing down what you are thinking and hence it becomes obvious that writing is a thinking exercise.

"How can I know what I think until I see what I say?" Edward Morgan Forster succinctly captures the purpose for including writing in freshman classes. Journal writing releases students from the perceived pressure of authority and grades that might inhibit their willingness to struggle with a paper topic. Until students learn that their ideas can take the form of words on paper, their essays will continue to regurgitate information obtained from what they consider more credible sources. And professors will continue to be disappointed in the performance of freshman students, whose papers, again and again, fail to meet their expectations.

Information gathered from two Seattle University English professors, Bean and Iyer, confirms that a great majority of freshman papers do not meet their expectations of mature writing. Bean discussed students' fear of actively participating in writing as a learning process. Bean instructs his class through lectures, examples of others' writing, and written assignments expressing his expectations for papers; also, students are encouraged to go to the Writing Center. This format of instruction is very similar to Iyer's instructions for writing papers in her English 110 class. Iyer has experiences that are similar to Bean's; in her current class of 23 students, 2 are mature writers who came to this college course with that skill intact. Unfortunately, her teaching of writing does not seem to be changing the level of mature writing among students in her class. Students' writing does improve by the end of the quarter, but it still lacks authentic voice and conviction -- the content of the paper that shows critical thinking and confidence. Generally, Iyer finds that new students lack negotiating strategies because they are dealing with many acculturation issues: separating from their family, finding their own food, establishing friendships, managing newfound freedom, learning the computer and library systems, and coping with homesickness. Furthermore, most of her students are "empirically oriented." In other words, they process physical reality and have difficulty grasping underlying concepts. They lack the intellectual depth to distinguish fact from fiction and are unable to ask questions themselves. The intellectual growth that is needed to become a mature writer "can't be built in a quarter. It comes from base education" (Iyer). For those students that enter college as mature writers (other than nontraditional students) Iyer asserts that they bring with them depth of experience, deep thinking, and a strong inquiry method. Interestingly, her star writer, "Sarah" (name purposefully changed), keeps a journal.

Iyer's assertion that new students are "empirically oriented" and unable to grasp abstract concepts supports our investigation of cognitive development. An understanding of the cognitive growth of adolescents and young adults will inform our ability to help students. In addition to researching the cognitive stages, we will investigate the different journaling

techniques explored by psychologists and English experts, with the belief that journaling will promote the thinking and writing process. "Valuing a personal process such as journal writing in education presupposes some dramatic and fundamental reconceptualizations in theories of learning, in notions of thinking, and in the purposes of writing" (Zacharias 265). The process of learning is intertwined with cognitive growth. A well known French psychologist, Jean Piaget, outlined the four stages of cognitive development: sensorimotor (birth to 13-24 months), preoperational (18-24 months to 7 years), concrete operations (7 years to 12 year), and formal operations (12 years and up). In addition to outlining the stages of cognitive growth, Piaget, the founding father of cognitive psychology, recommended changes in school curriculums that were appropriate to each cognitive stage. The curriculums were also intended to foster students' growth beyond their particular stage. Our research is concerned with formal operations as well as a curriculum recommendation that will foster the growth of new college students.

With the advent of adolescence comes the ability to think about abstract relationships, grasp syllogistic reasoning, and comprehend the elements of scientific thought and methodology (Morton Hunt 358, 361). Adolescents can formulate hypotheses, concoct theories, and systematically examine the possibilities in a puzzle, mystery, or scientific problem. Furthermore, adolescents can think not only about the concrete world but about possibilities, probabilities and improbabilities, about the future, about justice, and values (Hunt 362). The new skills brought by formal operations help to foster the broad questioning of old ways, old values, old patterns; this questioning is a central part of the identity formation process. The shift to formal operations enables the young person to rethink many aspects of his life, but it does not guarantee that he will do so (Helen Bee 474). As students mature cognitively, they begin thinking critically; however, transposing this thinking process into writing is a difficult transition that often frustrates educators and writing consultants alike.

"More complex mental activities, such as abstract reasoning, continue to develop into the early twenties" (Glenn Myers Blair 59). The cognitive shift from the concrete operational stage to the formal operational stage is necessary for critical thinking and authentic voice in the writing process. A students' thinking process is confused by the struggle for identity formation, which impacts their ability to write clearly and therefore aggravates the professor and writing consultant. The cognitive stage of formal operations allows students to consider alternatives to their current reality. As college students try out possible roles, they achieve a clearer identity than they had as high school students. In a study by O'Malley & Bachman it was found that, between ages 13 and 23, the self-concept usually becomes more positive. A clearer, more self-affirming identity is forming and with it comes a greater sense of control over one's future. Successful identity achievers are high in both exploration and commitment (Philip H. Dreyer 123). Thus, identity can be fostered by surrounding students with an educational environment that stimulates exploration and commitment. "For most young people a clear identity is not achieved until college age, if then, so the identity process continues" (Bee 473). The opportunity to write in a journal for class provides stimulating exploration that is simultaneously a commitment. Journal writing can help with the process of discernment and ease students into writing with conviction.

Students are undergoing great change in late adolescence. Norma Haan is a psychologist who suggests that early adolescence is a time dominated by assimilation, while late adolescence is primarily a time of accommodation (Bee 470). Assimilation, according to The Developing Child, "...involves the "taking in" of new experiences or information into existing schemes. Experience is not taken in 'as is,' however, but is modified (or interpreted) somewhat so as to fit the preexisting schemes" (485). Contrarily, accommodation is when a "...person modifies existing schemes to fit new experiences, or creates new schemes when old ones no longer handle the data" (485). Faced with a new social structure in college, and perhaps a new city and new home, students are overwhelmed and forced to accommodate in many areas of their life. Accommodation in the classroom as well could leave students feeling completely stripped of the skills that were valuable and useful in high school. Immature writers shy away from struggling with a paper because they are not yet comfortable with the process of accommodation in the classroom; accommodation was probably not needed in high school compositions.

Frank Smith explores the accommodation and assimilation between language and thought in his book Writing and the Writer. He argues that there is an ongoing thought process that is constantly accommodating and assimilating new information and perspectives. This process is unseen; the results are the language and writing that are produced.

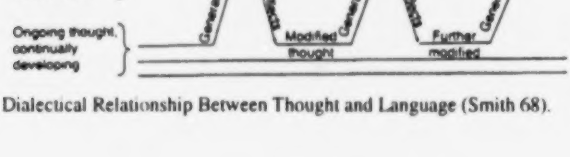

Figure 1: Dialectical Relationship Between Thought and Language (Smith 68).

As Frank Smith's model for the thinking process underlying the writing process suggests, nonconscious elements in writing are important and unavoidable. George Hillocks Jr. suggests that if this model is true, we need to take advantage of it. "Free writing and journal writing as means of generating content and language that helps reveal purposes to the writer are important in this regard" (Hillocks 94). Journaling is one way to bring this thinking process to the student's conscious attention and help them bring the unconscious elements of the writing process under control.

Journaling is writing down what you are thinking. There is most certainly a dialectical relationship between thinking and writing, both enhancing the other and thus fostering a student's cognitive growth. "Specific thinking processes have been found . . . to be demonstrable and teachable and are therefore regarded by many educators as skills" (Zacharias 266). As the need for teaching of thinking processes grows, the implementation of journal writing into curriculum should also grow. "Writing has come to be seen as a tool for learning . . . rather than merely an evaluative measure" (Zacharias 266). There are authoritative statements from educational practitioners that confirm the value of journal writing. In her article, Martha E. Zacharias quotes Strong, who calls journaling an integration of mind and body and "a means -- perhaps the best means -- to make knowledge personal, connected, and accessible to the self" (265). Zacharias elaborates on the relationship between thinking processes and journal writing in three important areas: classifying, criticizing and looking for assumptions, and decision making. These three skills, like Piaget's curriculum suggestions, both rely on and foster cognitive growth. A journal is helpful for "classifying" -- sorting out and grouping to develop order among things -- because: ". . . journals are powerful teaching-learning tools that provide students with opportunities for personal growth as well as language and cognitive development" (267). "Criticizing and looking for assumptions" connects to cognitive growth and identity formation. Zacharias bolsters our assertion about the connection between thinking and writing with specific examples from trained professionals. After all, "...journal writing assists the development of thinking processes. . . . educators believe that this relationship can be enhanced by providing guidelines for specific modes of response in journal writing" (269).

There are many ways to encourage the shift to critical thinking, but including journaling in curriculum has several advantages. Ann Berthoff points out that journaling allows room for ambiguity, while strict academic writing may not. Peter Elbow supports the value of eliminating the audience in writing. Jana Staton argues that a journal can serve as a means of prompting dialogue and communication between teacher and student. Others justify using journals in their classroom by pointing out that writing it down forces students to mull over their own thoughts and lets teachers keep track of this process. Peter Stillman talks about journaling as a private process that offers freedom and multiple purposes to the writer; in contrast, academic writing often limits the writer to a single purpose of informing or convincing.

The most obvious and inherent aspect of journaling is that it is a self-conscious and self-reflective act (Lowenstein 87). This characteristic is possibly the most helpful in aiding the student's shift to critical thinking and mature writing. For many students, writing and thinking are separate processes; writing is a separate, finished product that is distinct from thinking. Journaling gives the student the opportunity to recognize the close link between these processes, and to do so within the realm of their own experience. Pat Belanoff stresses the importance of journaling in the classroom because, "students begin to see them as repositories of their own developing thoughts. In fact, in reflecting on their journals, this is a development they often find fascinating: the way their own minds work" (Belanoff 107). As any mature writer would attest to, this self-knowledge is critical in attaining both depth and clarity of expression. Journaling, whether it is about a specific text or not, helps students nurture their ability to directly express what they are thinking in writing. When students are not overly concerned with performing for an audience, they can ". . . become consciously aware . . . That when they read, they enter into a conversation with. . . themselves about the text" (Belanoff 103). This process is self-interactive and helps the student realize the presence of underlying thought that is continually going into their writing.

One particularly useful method of journaling in the classroom is interactive journaling. While this style sacrifices some of the privacy that a journal can offer, it also promotes dialogue which is one of the most useful tools in a process of self-reflection. The primary purpose of interactive journaling is to give the instructor the opportunity to offer the student thought-provoking feedback about their ideas. Feedback is an essential part of the learning process. However, "the ability to give and utilize feedback, like other measures of communication performance, increases with age" (Asher 191). As students mature cognitively, the feedback and interaction that an instructor gives can be very useful. According to Dr. Iyer, "Journal writing works great for upper division courses because it continues the dialogue of reading."

Jana Staton praises the power of response to student journals as a chance to involve not only the written interactions between the student and the instructor, but their minds as well. Staton says that the value of students writing freely in a journal is understood, but ". . . what needs to be stressed and clarified is the importance of written, interpersonal dialogue as one means for introducing [students] to the open, expressive, thoughtful uses of writing as a mode of knowing oneself and knowing the world" (Staton 47). While dialogue is often viewed as a primarily oral exchange, the activity is easily adaptable to writing. By introducing dialogue to writing, the teacher is taking the monological performance pressure off the student, eliminating the anxiety centered around a solo, graded assignment, and promoting the importance of collaboration in thinking and writing. This approach reduces the authoritarian distance between student and instructor, but at the same time, as Staton points out, " . . . it is the quality of the response . . .that creates endless opportunities for learning" (53). While the college student is at a developmental stage of questioning old ways and ideas, the dialogue journal is designed to create interactions ". . . in which two minds can unite to bring about new understanding, new ideas, new possibilities" (54). A simple question from an instructor can illicit a thoughtful response. Vygotsky hypothesized that writing is more directly connected to internalized thoughts than speech is, allowing closeness of thought and expression to be retained in the written dialogue (124). Research has shown that ". . . teachers who are willing to . . . Make their own writing interesting, quickly draw students into making more elaborate responses" (Staton 56). This process of intellectual growth and self-realization is inherently tied to dialogue in some form or another.

Language and thought are fundamentally dialogical, and are acquired through conversational interaction. Journaling offers a practical way to carry this conversation into the classroom.

While the reasons for journaling are abundant and easy to grasp, the actual implementation of journaling in the classroom is more complex. The implementation of these tools in the classroom can disrupt what may be a comfortable teaching style, and can increase mutuality between students and the instructor. One of the most difficult aspects of implementing a journaling assignment or project in class is the loss of control and authority that the professor may consequently experience. The most staunch supporters of journaling embrace this loss of authority. However, Dawn Latta asks the key question: "How do we instruct students without dominating students' options in writing, and how do we return the control of writing to the students who are doing the writing" (Latta 60)? By implementing journaling in the curriculum, Latta says that the students own their ideas more fully, and are more likely to claim rather than attribute them to some greater authority like the teacher. However, in addition to owning the ideas, students become more conscious writers because, "By using in-process journals students, not teachers, own the problems associated with their writing" (Latta, 62). This ownership of ideas and difficulties does relegate more authority to the students in the classroom. While this idea may be threatening to instructors, it has several positive results -- like increased class discussion and participation.

Other concerns that teachers may have regarding journaling should also be considered. O.T. Kent addresses several of these objections to the method. "Certainly good spelling and grammar are important, but I want my students to take risks in their thinking, and it would defeat the purpose to insist that they perfect their prose first. The appropriate time to evaluate one's prose is *after* one has developed one's thoughts. The journal is a place to do the latter and not the former" (275). Iyer also has concerns about transferring journal writing into good writing; however, the point is not to necessarily create good writing but to develop thinking skills. As the student grows comfortable with thinking critically, they will also grow more confident in their ability to write with conviction. Kent also makes it clear that journaling cannot logically stand alone as a sole evaluative method, but that it should be used in conjunction with papers, tests, and other assessment tools. He admits that in response to the overwhelming amount of time involved in reading an entire classroom's journals, he has had to limit the number of times that students turn them in. Regardless of the time constraint, Kent praises the experience of journaling in his philosophy class: "If I want [students] to experience the joys of critical thinking and to develop their own distinctive responses to the world, then I must help them do philosophy in their own territory. Student journals provide me the opportunity to do this" (Kent 276).

There are precedents for using journals in almost every academic subject, from philosophy to mathematics. Journaling is easily implemented in any class where there is assigned reading in the form of reader response journals. With some additional effort, however, it is possible to implement this method in technical classes, mathematic classes, and science classes. Judy Grumbacher writes about "how writing helps physics students become better problem solvers" (Grumbacher 325), and others write that "journals [in a chemistry class] are a particularly appropriate forum for students' contemplation of the cultural context in which specialist learning takes place" (Meese 346).

There are many different titles that a teacher can give journaling: thinking journal, learning journal (Iyer), learning log, reading journal, reading log, focus log, and topic journals. The journal title can influence a student's perception of the assignment. Teachers also have options regarding the amount of structure that they can use within a journal. Structured journaling was born in the 1970's when psychologist introduced a journaling technique for therapy. The client was instructed to create a three column journal and chart events in their life, their initial thoughts and emotional reactions to that event, and their later, more rational evaluation of the event. This structure was intended to show unhealthy patterns of thought and thus help the client ameliorate them. By applying a variety of columning and sectioning techniques, teachers can get more specific "answers" as well as help students focus their thinking. One student writes: "Sometimes, I notice, I will realize that something is wrong after I write it down. Something about the writing it out makes me realize that it is not so -- like I can see it physically and then mentally know that it is wrong" (Belanoff 107).

This student's insight is a testimony to the value of journal writing. The implementation of journal writing into the curriculum of freshman English classes promotes the interaction between writing and thinking. There is overwhelming evidence from psychologists and English teachers alike that supports journaling as a tool for promoting thinking processes. The evidence from Bean and Iyer suggests that students do not bring fully mature abstract thinking skills to college. Because the transition to college life requires accommodation in almost every aspect of a new student's life, learning how to accommodate new thinking skills in the context of a daunting writing process is difficult. Thus, in the footsteps of Piaget, we recommend a curriculum tool that fosters the shift to full use of formal operations. The variety of journals, such as interactive, personal, and reading journals, coupled with the freedom of structure, allows the instructor flexibility when implementing journaling. The jury is out: there is a dialectical relationship between thinking and writing. Writing in a journal pushes the student to struggle with concepts and ideas (formal operations) that are beyond the empirical realm; simultaneously, a strong grasp of formal operations will inform the writing process. The cognitive connections provided by journaling are valuable and empower the student to discover their own identity, ability, and personal voice. At times, journaling may even be a revelation: "I enjoy finding out what's in my brain, what comes out, because sometimes I don't know what it's doing or thinking" (Kent 331).

Faculty Advisor:

Sarina Chen

INTRODUCTION

In recent years many individuals devoted their time, energy and money just to make themselves "look good"--healthy and fit. The efforts can be seen in the abundant video fitness programs available for purchase and the fitness centers established; not to mention, the exercise equipment which have become popular advertising items one can find in the media. In the media, one can easily find something that is being promoted that can help all of the so called "unfit" people get into shape in no time flat--from Jenny Craig Fitness Program to Nordictrack. A critical issue embedded in this fitness craze is not if these programs or machines can produce the promised results for the consumers or not, but, more importantly, what is the meaning of "health" that is promoted in the media messages. This critical issue warrants the attention of the communication researchers as well as the consumers, since most of the health related activities or products seems to promote the economic interests of the "health industry." A critical researcher or a careful consumer needs to look into the meaning of "health" been presented in the popular media to determine if this is the "health" that one likes to pursue.

To examine the meaning of "health" in the popular media, one can easily find the presentation of healthy lifestyles or exercises in the television, radio, newspapers, magazines or even in cyberspace. To examine the presentation of health in the media, the researcher studied the health magazines which serve a special population with a strong health and fitness concerns, considering that the television and the radio tend to serve the general public. The health magazines were chosen over the web sites in the cyberspace due to the large amount of visual images offered in the magazines, which allow the researcher to perform an analysis beyond the textual content. The researcher studied the images of health and fitness that are portrayed in the health magazines. The researcher is not intending to argue that these magazines are a fraud, but, instead to reveal the images of health and the underlying meaning embedded in these images.

LITERATURE REVIEW

The cultural studies approach (McQuail, 1984) as extrapolated by Stuart Hall (1973; 1977; 1982) was employed as a theoretical framework for this study. According to Hall (1977) the images portrayed in the popular media are not neutral, instead, they are value laden. More specifically, the media images reproduce the "dominant ideology"--the values and interest of the group of individuals who benefit from the existing power and economic arrangements. The media are believed to serve as a tool of domination for the dominant class by propagating the dominant ideology in the media content (Hall, 1982).

Researchers (Gurevitch, Bennet, Curran and Woollacott, 1982) of the cultural studies examine the media images and how they projected the ideological meanings or the "preferred readings". Students of the cultural studies work to reveal that the media, by being part of the cultural structure, reflect, resemble, and reproduce the dominant ideology of the existing social/cultural arrangements. To uncover the dominant ideology embedded in media products, a critical researcher would perform a close reading of the media images. By performing such analyses, the researcher can uncover a preferred reading suggested in the media text. Guided by the cultural studies, the researcher would be able to reveal a dominant convention or "code" that was placed in the media messages. By offering a preferred reading of the media text, the researcher would be able to demonstrate the reproduction of the dominant ideology in the media.

Utilizing the culture studies as a frame of reference, the researcher hypothesized that the images in the health magazines reproduce the dominant ideology of the society. That is, these images would reflect the values of those who hold the political and economic interest in society today.

METHODOLOGY

In the research, ten health magazines for sale in a supermarket in a Midwest town were randomly chosen to be analyzed. A variety of health magazine were chosen for the analysis; ranging from men's only magazines to women's only, and ranging from magazines of physical body building to ones that deal with the mind. The ten magazines analyzed were: *Men's Workout, Ms. Fitness, Longevity, Exercise For Men Only, Stress Reduction and Weight Loss Workbook, Fitness, Heart and Soul, Diet and Exercise Guide, Slim and Fit Diet and Exercise*, and *Men's Health*. In the close reading of these magazines, special attention was paid to the visual images displayed and the advertisements carried. The findings of the analysis are reported in the following.

FINDINGS

The researcher noted the two most significant areas of investigation in the process conducting the close reading, which are the visual images and the advertisements. By studying the visual images, the researcher noted the target readers of the magazines, the amount of work required to be in shape, and the meanings of health and fitness for men and women. In the examination of the advertisements carried, the researcher noted the products promoted in these advertisements which revealed the economic interests of the magazines and the "health industry."

The visual images

The first item the researcher found to be significant was the target readers that these magazines were produced for. Exactly who is the target reader health magazines are looking for? One would think these magazines are out there for the entire public to enjoy, but they are not. The health magazines seem to be designed for a middle age population only. In the magazines that were analyzed the predominant age group that was being targeted was of people who were in their twenties to early forties. The middle age population was projected in the people that appeared and the products promoted in the health magazines.

The people who appeared in the health magazines all belong to a very narrow age group, which suggests that the magazines are intended for these people. Therefore, one can assume that the middle age group is the population that is most preoccupied with the health concern. Elderly, children, or disabled individuals were not presented in the magazines; therefore one would assume that based on these magazines, these populations do not seem to have a health concern as strong as the middle age population. Also, most of the people that appeared in the magazines are Caucasians. Therefore, it seems that health and fitness are predominantly a Caucasian concern in the American society today.

The next issue that these health magazines seem to suggest is, that with a little work the readers can get themselves in shape in just a few minutes or hours per day. The magazines portray that one can look as good as the model on the front cover of the magazine simply by investing the minimum amount of effort. It was never mentioned anywhere in the magazines that the people presented in the magazines are professionals who trained daily to obtain and maintain the physical shape. What an average reader may not realize is that by exercising on the Nordictrack twenty minutes each time and three times a week will never make him/her look the same as the model he/she saw in the magazines.

The visual images of the models appearing in the health magazines seem to call out an image in the minds of the readers that the goal to pursue of being healthy and fit is a perfect body as portrayed in the magazines. Across the different magazines there seems to be a definite trend forming regarding the meaning of being healthy and fit. The meaning varies based on gender differences. For men, the images of health are represented by the size and the tight muscle tone of the arms and the chest. For women, those are represented by the flat abdominal region and the firmness of the gluten--"Buns of Steel.". One interesting observation is that it seems to be a goal for the men to gain weight and muscle mass by doing various exercises and taking various formulas. The opposite seems to be true for women as women are trying to reduce their weight by doing various exercises and taking various formulas.

The meaning of health and fitness offered in the visual images analyzed seem to be one dimensional for men and women. Only certain areas of the human body are emphasized to represent the meaning of health. This narrow definition and image of health and fitness is not easily obtained by the average Americans. The fact that most of the Americans are unable to look like the models as they see in the magazines, may keep most Americans from trying to be "healthy and fit" as prescribed in these magazines. This common belief may lead to further perpetuation of the one dimensional meaning of health and fitness towards men and women. Mainly, according to this narrow definition of health and fitness, most Americans are "unhealthy and unfit," and many may give up trying to be healthy and fit if they cannot look like the models in a short amount of time. Consequently, many live in the guilt of not being healthy or fit.

The Health Advertisement

When one looked at the products that are advertised in the magazines, the picture of the targeted middle age group is even clearer. The products that are advertised mainly address the health concern of the middle age population. There is a wide range of products advertised in the magazines, ranging from those that deal strictly with the female sex to those that present ways to quit losing the hair. Products such as vitamins, muscle-building supplements and weight-gain formula are targeted for the middle age population.

These magazines carried a considerably large amount of health and fitness products. By targeting the middle age consumer, it is clear that the media and the health industry try to exploit the group of the population that is more likely to spend money on the products than other groups. The magazines and their advertisers are addressing the middle age group of consumers that exhibit the most purchasing power in the society. Therefore, by looking at the target population of these magazines, one can easily see how these magazines serve the economic interest of the dominant class--advertisers and the health industry. The argument which is put forth by the cultural studies scholars (Hall, 1982; McQuail, 1984) that the media are a tool for economic exploitation of the mass population by the dominant class, does have a merit.

The products that were advertised in the magazines seem to suggest that these are the products that a person will have to buy if he/she wants to be healthy and stay in shape. The promotional strategy seems to suggest that in order to get healthy and fit, to purchase these products is necessary. Usually, these are ready made products, all one needs to do is to purchase them and consume them, no extra work is needed. For instance, to obtain a toned abdominal region, one would simply have to purchase an abdominal workout in a jar and just rub it on, as stated in the advertisement of "Vaughn Louise Abdominal Workout Cream." It seems to suggest that by taking these products internally, one can obtain a perfect physical shape. Strangely, these advertisements do not suggest that exercise is needed. Moreover, very few exercise equipment were advertised in the health magazines. Mainly, the products advertised promote a quick and easy way to become healthy and fit in this fast paced society. No hard work is projected in the advertisements, simply purchasing and taking these products, one will be healthy and fit.

All the advertisements promoting health products in the health magazines utilized professional body-building models as endorsers. By associating the products with these "healthy and fit" individuals, these advertisers try to convey to the readers that by purchasing these products, you will be able to look just like these professionals. The promise may be unrealistic, but is embedded in every advertisement. For the consumers who purchased these promoted products, they may not be able to look like these professionals. Instead, by purchasing these products, the consumers approach the feeling of looking like these professionals, and the potential of obtaining the healthy look.

CONCLUSION

One of the effective ways to understand the dominant definition of health and fitness in the current American society is to examine the images of health popularized in the health magazines. When one examines those images, one needs to question the underlying messages embedded. A critical reader has to investigate what is suggested in these images. This study found that the health magazines are the tools for the exploitation of the American consumers by offering one dominant meaning of health to the public. This dominant meaning of health may lead to a false perception that everybody can look as "healthy and fit" as the models presented in the magazines. The perception of health may further lead to the exploitation of the consumers' money and time.

The constant wave of advertisement in the magazines seems to brainwash the public into thinking that they need to buy the products advertised in order to be healthy. By shoving this view on to the public the magazines and the advertisement companies form an impression regarding what it takes to be healthy and fit. The advertisements demonstrate the working of the dominant reading in the media, which serves the interests of the "health industry." This type of advertising exhibits a potential exploitation for the simple fact that there are no information regarding diseases and health concerns such as cancers, AIDS, diabetes. The health magazines studied, sell products and propagate a healthy physical image; they not educate.

There may be many different types of health and fitness magazines for the public to consume, but they are all seem to propagate the same ideal of health--a perfect body, and promote the similar products to obtain the ideal. The visual images and products presented all seem to target the group of people who have the financial means to purchase the product. These magazines all seem to tell the public that anybody can look like the models that appeared in the magazines with just a little time and effort. The exploitation and confusion that are presented in the media warrant the attention of critical researchers and careful consumers. The researcher calls for the construction of alternative meanings/definitions of heath and fitness beyond what is offered in the popular media today. Alternative meanings/definitions that are obtainable, realistic, and addressing to the health interest of the general public, and not the economic interest of the health industry.

Blissfully Rude: The Diatribe of ACT-UP

Mark S. Buchanan

Faculty Advisor:

Suzanne E. Lindsey

Since the Greco-Roman era, many groups have resorted to unconventional means in an effort to convey a message. Theodore Windt, a rhetorical critic, defined these bizarre acts as a Diatribe. The Cynics of the Greco-Roman era used the Diatribe, an extemporaneous sermon, to display their dissatisfaction with the public ethics and dominant culture of their time. In modern times, the Diatribe has emerged as a channel for social discontent. The outrageous actions of the AIDS Coalition to Unleash Power or ACT-UP illustrate the power of the Diatribe and very nearly parallel the actions of the Cynics. This paper will explore the genre of the Diatribe, defined by Windt, as it was used by the organization and individual members of ACT-UP. The paper will further examine the rhetorical devices used by the group as well as evaluate their effectiveness.

THE BIRTH OF "DIRECT ACTION"

In Puritan America, the "scarlet letter" was a stigma connected to adultery. Since the early 1980's, it has been connected to AIDS. As the eighties began, the AIDS epidemic threatened to halt the gains made by the gay and lesbian movement in the previous decade. Anti gay forces were quick to take advantage of public concern with AIDS, equating homosexuality with disease. Syndicated columnist Pat Buchanan was in the forefront, "The sexual revolution has begun to devour its children," he wrote in a May 1983 column. He pronounced AIDS to be "nature's revenge...The poor homosexuals: they have declared war on nature and nature is exacting an awful retribution."[1]

But rhetorical attacks from conservatives did not stop in the printed media: the gay community faced a presidential administration which refused to even utter the word "gay" much less address an epidemic which affected them. Ronald Reagan, under whose presidency the AIDS epidemic originated and flourished, had not formally raised the issue until April 1, 1987, in a speech to a group of physicians in Philadelphia--a full seven years after the onset of AIDS in the United States.

As AIDS spread, the government remained impassive, refusing to allocate sufficient funding to the National Institutes for Health to conduct research. While pressuring the government for funds through conventional lobbying efforts during the first few years of the epidemic, gay men in New York and other cities had no other alternative but to raise the needed funding privately. According to Randy Shilts, the only reporter in America on a full-time AIDS beat since 1982 at the San Francisco Chronicle: "No one cared because it was homosexuals who were dying. Nobody came out and said it was all right for gays to drop dead, it was just that homosexuals didn't seem to warrant the kind of urgent concern another set of victims would engender."[2]

A form of group cohesiveness would emerge from this dilemma which proved to be valuable as the gay community sought ways to combat this new disease and continue to fight an old one: homophobia. As time wore on, many in the group began to feel that the normal paths of protest and lobbying were unproductive. They felt that more "direct action"[3] would make them more visible and hopefully taken more seriously in a society that did not. This pattern of thinking evolved into a very vocal and outrageous organization called "The AIDS Coalition to Unleash Power" or "ACT-UP." This organization used a myriad of rhetorical acts to bring its message to the forefront of AIDS policy. Sometimes their methods were reminiscent of the Greek Cynics who had used the Diatribe to convey their messages in the Classical Era.

This essay will explore the genre of the Diatribe, defined by Theodore Windt, as it was used by the organization and individual members of ACT-UP. It will examine the rhetorical devices used by the group as well as evaluate their effectiveness.

ACTING UP: GRECO-ROMAN STYLE

In his essay, "The Diatribe: The Last Resort For Protest,"[4] Theodore Windt traces the history and actions of the Cynics of the Greco-Roman era. He describes them as being concerned with public ethics rather than private morality; as cultural critics rather than politicians. They rejected the strategies of Aristotle to "persuade by drawing on the beliefs of the audience as sources of proof." Instead, they believed that "man's conscience, his logic, and emotions, his perspectives and his attitudes have been corrupted by immoral institutions." To convey their messages, the Cynics incorporated the diatribe, "an extemporaneous sermon"[5] based "on themes drawn from their own doctrines--usually paradoxes which would attract a crowd; and they illustrated them with anecdotes, character-sketches, fables, dialogues against imaginary opponents, topical references, parodies of serious poetry, obscene jokes, and slang phrases."[6]

Windt explains that these tactics of direct action have been resurrected several times in the past few decades: The Beat Generation of the 1950's, the Merry Pranksters of the early 1960's, and by Jerry Rubin and Abbie Hoffman, who formed the Yippies movement of the late 1960's. Indeed, Dr. Martin Luther King, Jr., in his "Letter from a Birmingham Jail,"[7] recognized the need for direct action in certain circumstances because "non-violent direct action seeks to create such a crisis and foster such tension that a community which has constantly refused to negotiate is forced to confront the issue." He continues:

> Just as Socrates felt that it was necessary to create a tension in the mind so that individuals could rise from the bondage of myths and half truths to the unfettered realm of creative analysis and objective appraisal, so must we see the need for nonviolent gadflies to create the kind of tension in society that will help men rise from the dark depths of prejudice and racism to the majestic heights of understanding and brotherhood.

King stated "the purpose of our direct action program is to create a situation so crisis-packed that it will inevitably open the door to negotiation."[8] These types of protests were identical in philosophy to the diatribes of the Cynics. With the emergence of ACT-UP, the traditions of the Cynics seemed to have appeared once more.

ACTING UP: AMERICAN STYLE

The time had come for many gays in America, who were increasingly frustrated with the government's and society's slow reaction to AIDS, to look for other ways to show their disapproval. Their intent was to show that these institutions were hypocritical in their reticence to assist the homosexual community. Radicals within the group had always called for drastic, violent measures to aid the nation in coming to grips with its homophobia, and the AIDS epidemic was no different for them. Others recognized the need for something innovative, refreshing, and controversial that would enlighten the nation to the plight of AIDS infected individuals. One of these people, author Larry Kramer, soon became the voice and driving force behind what would become the organization ACT-UP.

On a Tuesday night in March 1987, the "Decade of AIDS"[9] moved into a new phase. The setting was the monthly speaker's series at New York's Lesbian and Gay Community Center. Onstage was Larry Kramer who started off by asking everyone on one side of the audience to stand up. "At the rate we are going, you could be dead in less than five years," he informed them. "Two-thirds of this room could be dead in less than five years."[10] He went on to criticize the Food and Drug Administration for its slowness in testing and approving experimental AIDS drugs. A billion dollars was being thrown at AIDS, but it was not buying anything that could save the "two-thirds of the people in that room." There were now thirty two thousand cases of AIDS in the United States. Something had to be done. He went on:

> Today's front page of The New York Times has an article about two thousand Catholics marching through the halls of Albany today.... That's advocacy!....Why are we so invisible, constantly and forever?....Did you notice what got the most attention at the recent CDC conference in Atlanta? It was a bunch called the Lavender Hill Mob....They protested. They yelled and screamed and demanded and were blissfully rude to all those arrogant epidemiologists who are running our lives.[11]

The speech was illustrative of Kramer. He was always emotional and always direct. This speech, however, seemed to have caught the popular mood. The audience proposed following up Kramer's rhetoric with action. Two days later, three hundred people met and established a new organization--the AIDS Coalition to Unleash Power. The group decided to focus on one issue--to fight for early release of all experimental drugs that could treat AIDS. Its motto would be "United in anger and committed to direct action to end the AIDS crisis."[12] It was time for action---for screaming and yelling and being "blissfully rude." The politics of anger had arrived.

THE ART OF ACTING UP

Soon after ACT-UP's founding, the new organization got the opportunity to show its mettle. Burroughs Wellcome, manufacturers of AZT, the only drug licensed to treat AIDS, announced that it was pricing AZT at ten thousand dollars for a year's supply. To the ACT-UP members, that price smacked of profiteering. In response, 250 people marched to Wall Street. They hung an effigy of FDA commissioner Frank Young in front of a church in the heart of the financial district. They passed out leaflet condemning Burroughs Wellcome for its pricing of AZT. Then they did something that had not been done before at a gay rights or AIDS demonstration---they sat down in traffic in the middle of rush hour, completely tying up lower Manhattan.

ACT-UP "demos"[13] became renowned for their keen sense of political theatre and ability to attract media coverage and thus an audience. Most famous was its October 1988 effort to shut down the Rockville, Maryland, headquarters of the U.S. Food and Drug Administration, where over a thousand people participated in a series of "minidemonstrations" over a nine-hour period. At one of the day's protests targeting the FDA's refusal to release sixty experimental drugs to people with AIDS, ACT-UP members staged a "die-in" in front of the agency. They lay down on the street and held paper "tombstones" over their heads that read: I DIED FOR THE SINS OF THE FDA; DEAD--AZT WASN'T ENOUGH; DEAD--AS A PERSON OF COLOR I WAS EXEMPT FROM DRUG TRIALS; I GOT THE PLACEBO- --RIP.[14] By the end of the day, 176 people had been arrested.

Sometimes the theatrics of the group turned abrasive, focusing on religious figures in the Catholic church hierarchy. This was particularly true regarding ACT-UP's "zaps" of the Roman Catholic Church. Journalist Michelangelo Signorile describes an incident involving Joseph Cardinal Ratzinger, the German prelate, who was in New York for a speaking engagement at the invitation of that city's John Cardinal O'Connor. Ratzinger had written a paper for the Vatican that described homosexuality as a moral evil. As Ratzinger rose to speak at St. Peter's Church, a group of eight people in the crowd leaped to their feet and began to chant, "Stop the Inquisition!" Someone else yelled "Antichrist!" and "Nazi!" Signorile himself jumped up on a platform, pointed at Ratzinger, and shouted, "He is no man of God--he is the Devil." Then there was the December, 1989 zap at St. Patrick's Cathedral that featured ACT-UP members interrupting an ongoing service and stomping on communion wafers while five thousand others outside the church chanted "You don't say f---, we say f--- you!."[15]

EFFECTIVE ACTING UP?

Whatever the motivations of the members of ACT UP, the effects or results of their actions followed the same pattern as that of the Cynics. Windt points out that the "major weakness of the diatribe is that it is limited in effectiveness." Once the dissenters have spoken, the audience tends to look for "serious remedies" that are "seriously treated."[16] As with the Cynics, "serious remedies" for existing policies in AIDS drug approval were instituted after the Diatribe of ACT-UP. For example, following several years of ACT UP protests, major changes in the FDA's approach to approving experimental drugs took place. Drug regulation was eased, and drugs proven safe but not yet proven effective were made available to AIDS patients. As a result, "ACT-UP is now widely credited for speeding up the drug approval process." One HIV neurologist stated, "The involvement of ACT-UP...has had a very positive influence"[17] on AIDS research. Kramer, who has since left ACT-UP, summarizes the group's accomplishments: "We made AIDS a political issue; we changed the image of gay men from limp-wristed fairies to tough warriors; and we got the drug approval process changed from ten years to, in some cases, less than one year."[18] These changes have not translated into breakthroughs in AIDS treatment; though the drugs have been made available sooner, few have showed much promise. As a result, ACT-UP has lost some of the energy it possessed. Martin Delaney, the head of Project Inform, explains:

> Everybody thought we could jump into AIDS research and make a difference in the short term. Maybe break a boulder that was blocking the path. Well, we did that, but there was always another boulder or we found that there was no path underneath it all along. Everybody's burned out: I am, we all are. [19]

Apparently, the actions taken by ACT-UP had had a positive effect, though the ends to their means were not all they had hoped for.

Conversely, the demonstrators of the ACT UP organization constantly faced negative reception to their rhetorical acts. Their behavior brought about much media attention, but it antagonized the public, and in the case of the Roman Catholic Church, turned strained relations into "permanent enmity."[20] Some called the protests "self-indulgent and counter-productive."[21] President Bush voiced his disapproval of the organization, calling ACT UP protests "an excess of free speech," and told reporters his administration has tried "to be very sensitive to the question of babies suffering from AIDS, innocent people that are hurt by the disease."[22] These attitudes, coupled with the public sphere's reticence to address "private matters" in the public arena, often elicit a negative response to anyone broaching a controversial topic. Perrow and Guillen offer the following analysis:

> AIDS activists...clash with social norms which define matters of sex and sexuality as private. Issues that surround the transmission of HIV and AIDS are among the most forcefully relegated to the private sphere. Early discussions of AIDS, for example, focused almost exclusively on the ties between AIDS and male homosexuality. Even given the increasingly frank public discussion of sex and homosexuality, however, social norms preclude the open discussion of male sexual practices, and especially anal intercourse, the practice most closely linked to the transmission of HIV. Nor do the other modes of transmission of HIV and AIDS lend themselves to public discussion. A large number of cases of heterosexual transmission of HIV and AIDS are linked to intravenous drug use and prostitution, about which public discussion is rare. Thus, social stigmas prevent AIDS from becoming a public issue in any real sense. [23]

It would seem that Windt's ideas proved correct in his theory of the Diatribe.

FUTURE ACTING UP

The diatribe of the group ACT-UP enhanced the public's perception of a private issue, portraying gays to some as courageous, caring individuals and not the sex-crazed pleasure-seekers depicted by the media and certain conservative groups. To others, the diatribe portrayed its participants as extremists and rude fanatics. Just as the Cynics of the Greco-Roman era sought to confront the establishment with its own inadequacies, ACT-UP 's "in your face" tactics mimicked those strategies. But some differences have emerged. Windt states that "the Cynics did not possess power and by all accounts did not seek political influence. They were cultural critics, not politicians."[24] ACT-UP's Diatribe is far from just a mere criticism of society; indeed, they fully intended to gain political influence, and they possessed both financial and political clout from the start. Obviously, the genre has evolved since its inception.

The AIDS decade brought about many changes in the gay and lesbian movement. It created a deeper sense of community and put gays and lesbians in the public eye. The appalling neglect of the Reagan and Bush Administrations helped to mobilize homosexuals as a political force and pushed some groups into a militancy that had not been seen since the early days of gay liberation. No doubt a stronger, more committed gay community evolved poised to face the adversities of the 1990's.

EYEWITNESS VS. PSEUDO REALITY: A COMPARATIVE ANALYSIS OF STUDENTS' ACCOUNTS AND THE MEDIA REPORTS OF A UNIVERSITY DISTURBANCE

Ben L. Daniels

Department of Communication Studies
University of Northern Iowa
Cedar Falls, IA 50614

Faculty Advisor:

Sarina Chen

INTRODUCTION

On Saturday, October 12th, 1996, in Cedar Falls, Iowa, the students of the University of Northern Iowa were celebrating their homecoming. Unfortunately the night did not end on a happy note. On the "College Hill," an area where taverns and restaurants were located, near the university campus, a "riot" broke out; and by Monday, the 14th, television news reports and newspaper articles about the incident were spread around the country.

The author, a student of the University, was out of town when the incident occurred. Like most of the concerned students who were not present when the disturbance took place, the author sought information regarding this incident from various sources. The result of the search, brought conflicting accounts of the incidents. According friends of the author, who were the witnesses of the incident, the disturbance was instigated by the local police. However, from reading the newspaper reports of this incident, one could easily see that the students were solely to be blamed for the disturbance.

A research interest developed as the author compared the conflicting accounts. The author then set out to conduct a systematic study of the accounts of the event from these two sources: eyewitness and newspapers. More specifically, this study is a comparative analysis of students' accounts and the newspaper reports of the incident. The author conducted a content analysis of the news reports regarding this incident on two newspapers. Also, to collect the University students' accounts of the event, the author analyzed the data resulting from interviewing students who were witnesses and non-witnesses of the disturbance.

By comparing the newspaper reports with the witness accounts and non-witness accounts, the author attempted to achieve two goals. By contrasting the media reports with the eyewitness accounts, the author would like to show the different perspectives taken by each party. Also, by comparing the media reports with the non-eyewitness accounts, the author would like to reveal the impacts of the media reports, that is, how the media reports helped shape the non-witness accounts of the incident.

LITERATURE REVIEW

Communication researchers have pointed out that media have the potential for structuring issues for the audience (Lippmann, 1921; Shaw and McCombs, 1977). One of the leading scholars who discussed the structuring impact of the mass media is Walter Lippmann. Lippmann maintained that as a result of the structuring act performed by the media, the audience responded not to actual events in the environment but to a "pseudo-environment" (Lippmann, 1921). As a consequence, the media are responsible for "the pictures in our heads" (Lippmann, 1921).

According to Lippmann, the structuring act performed by the media seems to be necessary to assist the audience to comprehend, manage, and act upon the complex environment. If the structuring act is necessary, then the question is whose views were presented in the media?

This study is an attempt to answer the above question by analyzing the media reports of a recent "melee" occurred near a university campus. To reveal the views and interests adopted by the media toward this incident, the author would contrast the media reports with the witness accounts of the event. The views and interests of the media can be further revealed by studying the views of the non-witness of the event, who mainly obtained the information about the event from the media. The contrast of views between the witness and non-witness serves to intensify the differences between the "environment" as described by the witness and the "pseudo-environment" as presented by the media.

METHODOLOGY

In the research, the news reports of the disturbance on a local and regional newspapers--Waterloo Courier and Des Moines Register--were analyzed. The news reports are news articles written by the news reporters, which do not include editorials, special columns or letters to the editor. The time frame of the news articles studied was set at a week period following the incident. In total, eight news articles were collected and analyzed.

In addition, the researcher utilized the interview data collected by students who were enrolled in a Reporting class at the University of Northern Iowa. In total, one hundred and thirty-two university students who served as the volunteers for this study, were interviewed, which included 66 eyewitnesses and 66 non-eyewitnesses of the event. In the face-to-face interviews, open-ended questions were casted. Volunteers who were the witnesses of the event were asked to describe the incident as they experienced it, and also to contrast their experience with the media reports which they later came into contact with. The non-witness volunteers were asked to describe the incident as they knew it and to recall the sources where they obtained the information about the incident. The interviews were conducted within the week following the incident to ensure the accuracy of the volunteers' recollection of the incident.

EYEWITNESS ACCOUNTS VS. PSEUDO REALITY

In this study, the author examined the eyewitness accounts of the disturbance by analyzing the interview data of the students who were at the scene of the "riot." The author also studied the "pseudo environment" presented on the media by analyzing the news stories on the newspapers. The following discussion presents the eyewitness accounts and the media reports of the incident, which present two drastic different points of view. Also, the author investigated the effects of the media reports by reporting the accounts of the non-witnesses who obtained the information about the incident mainly from the media. By noting how the non-witnesses sided with the media reports, it is easy to see how the media are responsible for the "pictures in our heads."

The Pseudo Reality

By analyzing the two newspapers, the author located two common themes running throughout various reports, which include (1) blaming the students for the disturbance and (2) propagating and defending the institutional standpoint and official conduct during the incident.

First of all, each paper maintained their focus on blaming the students for causing the disturbance. In the reports analyzed, the students were characterized as initiators of the incident, and the police were simply trying to respond to the destructive acts of the students. The incident was reported as "triggered by the overturning of a car about 12:45 a.m." (Des Moines Register, 1996a). "Officers righted the vehicle, and the mob then rolled it onto its roof, overturned a second car and attempted to set one of them on fire" (Des Moines Register, 1996a). The newspapers reported that the police officers decided to disperse the crowd as a response to the crowd's irrational behavior. However, the police's decision was responded to by "lobbing beer bottles and cans" (Des Moines Register, 1996a). "As officers pushed the mob north on College Street, rocks and bricks also were thrown" (Des Moines Register, 1996a). The irrational and destructive nature of the students were communicated by using the "mob," to characterize them.

Each newspaper spent a considerable amount of effort backing the mayor of Cedar Falls, Ed Stachovic, and his controversial decision to ban alcohol sales before midnight of the Homecoming evening, which was two hours earlier than the normal closing hour, 2 a.m. The newspapers showed their support of the mayor by giving the mayor the opportunity to explain his decision. It was reported that, "'We already had a problem well before 12:15 a.m.,' said Stachovic. 'I felt it was prudent and wise to shut off the fuel that was feeding the unrest'" (Des Moines Register, 1996a). The newspapers quickly came to the aid of the mayor by publishing many interviews of him, which allowed the mayor to defend his side of the story. By reporting the mayor's point of view, not the students', the newspapers supported the mayor and suggested that it was not the mayor's decision, which was to be blamed.

The papers also sympathized with the police officers and their efforts. The reports of the action taken by the police portrayed the police as nonviolent or nonaggressive. "Cedar Falls police were setting up skirmish lines and falling back while waiting for reinforcements during a melee Saturday night..." (Des Moines Register, 1996b) On the other hand, the crowd was portrayed as aggressive, unruly and resistive. Paul Hoffey, Cedar Falls Public Safety Director, was reported to say that "We (the police) attempted to move the crowd out of the area and met with considerable resistance. Rocks and bottles and pieces of glass were being thrown at the officers" (Des Moines Register, 1996b). The newspapers continued to state that the "Officers were under orders not to use their batons; they were told to 'use the force of persuasion or pepper spray,'..." (Des Moines Register, 1996b). The newspapers reported that the police officers "showed great restraint" (Des Moines Register, 1996a).

The police took action toward the crowd, pepper spraying the crowd, as the last resort to react to the irrational crowd. The police took action only when the crowd overturned the cars, one officer was assaulted by a brick thrown from the crowd, and several officers were pelted with rocks. It was reported, when the mob began throwing beer bottles, cans, rocks and bricks, "two officers were felled by flying objects; one was treated at a hospital.... Four police vehicles and an ambulance were damaged" (Waterloo Courier, 1996c). During the incidence, the police used the least amount of force as the situation allowed--pepper spray and persuasion.

Newspaper reports mainly described the police action as a means to ensure public safety, not to crack down or retaliate the crowd who were taunting the police. The reports stated several incidences where the police was forced to take action to protect the public. A newspaper reported the accounts offered by Paul Hoffey, Cedar Falls Public Safety Director.

BEST COPY AVAILABLE

Hoffey was reported to had said, "...when crowds began filling College Street, the police blocked off the Hill business area at 11:30 p.m. to protect people from passing vehicles" (Waterloo Courier, 1996c). Also, when the first vehicle was overturned, Hoffey also was reported to say that "Fearing rocking or spinning of the vehicle would injure someone, Hoffey dispatched four police officers to reflip the car onto its wheels" (Waterloo Courier, 1996c).

The newspapers were sympathetic to the danger faced by the police officers in the disturbance. The sympathetic standpoint is revealed in a report about the necessary use of batons in a incident like this. It is reported that, "Waterloo Police Chief Bernal Koehrsen was reported to say that the riot never approached a threat serious enough that officers had to pull out their weapons, but he believed that it reached "a baton response level" (Waterloo Courier, 1996b). The newspapers showed their support to the police not only by giving Koehrsen's viewpoint an extensive coverage, but also reported the injuries and threats the policed experienced. For example, Koehrsen was reported to be pelted with three rocks during the riot, and he said, "a riot is the exact case when you really want the baton with you. We were outnumbered 30 to 1" (Waterloo Courier, 1996b).

The Eyewitness Accounts

Students who are the witnesses of the event began their descriptions of the incident with the initial stage of the disturbance. A male sophomore, Electronic Media major, stated, "There were tons of people in the street, and the crowd got out of control when the bars were forced to close down early, and unleashed the angry drunks on to the street." Another male sophomore stated that people flooded out of the bars and were very angry. A female senior said that after the bars closed early she was mad because she and her friends just got in and had to pay the cover, and they did not even get a drink. A female sophomore, a Marketing major, said, "I was very mad! I had just paid four dollars to get in and they were turning around and kicking me out!" She continued that when she and her friends were outside of the bar complaining with some other people when the pepper spray started to come down without warning.

A male freshman said, "When the bars cleared out, the cops were already out there." And, "There were more cops on the street than I have ever seen in my life," said a male sophomore majoring in Accounting. A female junior, a Finance major, said that the cops were everywhere dressed in full riot gear. She said that it appeared they were expecting "All hell to break loose." A female, junior with a Marketing major, said that the cops were armed with riot gear, desperately looking for trouble or to create trouble. According to her, "This 'pissed' people off." She said that the rage grew once the pepper spray was used to chase the crowd down the Hill.

According to the accounts of several students, it seems to be the police that initiated the incident. A male senior majoring in Business, stated that students were basically peaceful until the police became forceful. A 23-year-old male senior with an Elementary Education major said that he was in the street talking when he suddenly heard shots of the pepper spray cannon. According to him, nothing was going on when the police shot off their cannons. He said that people began to run and "just went nuts." He then saw the officers apprehending students who were too rowdy. A 21-year old male said, "It was all fun and games till the cops messed with us. I got hit in the shoulder with something from a cop and I was just there to have fun."

Students also provided accounts stating that the police used their batons, even though the police department denied the use of such a device. A male freshman with an Electronic Media major, said that he showed up at two in the morning and the police were chasing people all over. He saw the police were pepper spraying and beating others with billy-clubs. Another male student also raised the issue of the night sticks. He said, "The cops say they didn't have them, but I saw people being hit by night stick wielding officers."

Some described in the interviews about the experiences of being tear gassed. A female student majoring in Physical Therapy stated that she was in a group that was directly maced. She said, "...it stung my eyes really bad, and it was hard to breathe for a little while." A sophomore male with a Business major said, "It sucked! The damn police sprayed that pepper spray and it was hard to breathe."

Several students complained that they were gassed even as by-standers. A 19-year-old sophomore majoring in Communication and Computer Sciences, stated, "The tactics that were used by the cops were really unnecessary because innocent people got gassed and hit for trying to get out of the way." A female junior said, "I was just standing on the sidewalk with some of my friends when just out of the blue the police started spraying us with mace for no reason. I wasn't drinking or breaking any laws and I got sprayed. To me, that is not right. I feel betrayed by the police."

Witnesses said that the police didn't handle the incident properly. Some said that the police overreacted which triggered students to become violent. One 21-year-old male junior majoring in Business said, "The cops...were really to be blamed for causing the problem because the riot wasn't really any worse than the riots in years before." A 20-year-old male freshman with a Pre-business major, said that he didn't feel that this situation "was that big of deal" and that "the police overreacted by storming the street..., and fueled the situation by pissing off the students." A male freshman felt that the riots would not have happened if the police did not use, in his words, "excessive force" in trying to keep a handle on the situation.

Generally, the occurrence of the riot amazed the students who witnessed it unfold. Many said that it was just a select group of people that were being violent, and throwing things; the rest, as they put it, "just stood there in awe, because we hadn't ever seen anything like it. It was kinda cool because nothing exciting ever happens here." A male freshman with a Business major said that the cops took off running toward anything suspicious "just like you see on T.V. and in the movie." An amazed sophomore summed up his observation and said, "It was crazy, but hey it's college!"

The witnesses's evaluations of the media reports of the disturbance are unanimously negative. Most of them believed that the media reports had been one-sided, that is, the media sided with the law enforcement against the student body. In the media reports, many believed, more weight was being put on what the city officials had to say, and not the college students who experienced it. Many observed that the media placed most the blame on the students, and not commenting on the mayor's decision or the police's behavior as the the problem. As a Construction Management major said, "The media only focused on the few disruptive students and the "brave policemen," and not on the full spectrum of occurrences that evening." Consequently, the media made it seem as though it was all the students' fault--the students were totally responsible for the riot. One female student said that the media had made the students seem like an out-of-control group of delinquents.

Many students believed that the media blew the incident out of proportion by trying to add drama to the story. One male student felt that the media portrayal of the disturbance was way off base, and said, "Some papers made it seem like the LA riots after the Rodney King trial." "It's not like they (the students) were killing anyone," said a female student.

Some were angered by the false media reports which differed from their first-hand experiences. One female student cited a statement in a newspaper that said the police were being tossed around like rag dolls, which she said was a total fabrication. A male student was upset at the media's reports on the riot as he said, "The media said that the police didn't use their billy clubs, but myself and a friend were clubbed after we were repeatedly sprayed with pepper spray. It was a lie."

The Non-eyewitness Accounts

Of the sixty-six students interviewed who were non-witnesses of the event, some received the information about the incident from friends, but most of them became aware of the incident as a consequence of their exposure to media reports. To illustrate the effects of the media reports on the non-witnesses, the accounts of those non-witnesses who received information from face-to-face communication were discarded, only the statements of those who received information about the incident from the media were examined.

Those non-witnesses who obtained the information from the media which adopted a position sympathetic to institutional conducts, exhibit some common reactions toward the event. Mainly, they were influenced by the institutional viewpoint of the media. Generally, they were angry at the students who caused the riot, they were ashamed of the incident, and they firmly believed that the police were in the right. Needless to say, these common reactions toward the incident are different from the experiences of their peers who experienced the incident first hand.

By reviewing the interview data of these non-witnesses, expressions of anger toward the students who caused the riot were noted. Many believed the incident had given the university a negative image on the media, and the entire university's reputation was damaged by a few students. "I am embarrassed to be a part of UNI right now," said a 23-year-old Business Management major. A male freshman majoring in Mathematics felt ashamed after reading the stories on the newspapers regarding the disturbance, as he said, "I would think people would have more respect for their school, community, fellow students, and themselves to participate in such a demeaning act of drunkenness. I hope that the students who took part in this disgraceful act are severely punished for what they did."

Almost all of the non-witnesses studied believed that the police action was justified. A male, junior, Mass Communication major, felt that the police were justified to retaliate to the mouthy kids with the action they used. Another male student said, "The police did their job as best they could. It sounds like the students were too wild."

Even though the non-witnesses studied generally took a point of view different from those of the witnesses, they did share the same shocking experience regarding the occurrence of the incident with the witnesses. A male junior, an Accounting major, said, "It's a shame people have to do this, but its only happens once a year so I guess it's alright. It would have been neat to see, I wish I could have been there to experience it." A male freshman with an Education major felt that homecoming should be fun and people shouldn't be destructive. "But hey we made it on MTV and CNN," said the male student.

CONCLUSION

In the comparative analysis of students' accounts and the media reports, it was found that the newspapers mainly adopted a pro-institutional standpoint, the eyewitnesses defended the students' viewpoint, whereas the non-eyewitnesses studied were influenced by the media reports and believed that the students were to blame. The author concluded that the pseudo-environment presented on the media is mainly an institutional interpretation of the events occurred, which is different from the eye-witness accounts. What is interesting to note is that within the University community, people may have different perceptions of the disturbance based on different sources via which they obtained the information about the incident. Some students were angry at the police, whereas some others supported the police, and were angry at their fellow students whom they believed caused the incident. For future studies, researchers can look into the media reports not only on the newspapers but in a wide range of media sources such as the television, the radio, the magazines or electronic sources of information, and to determine how these channels of information may generate their own pseudo-environment for their audience/users.

HAWAI'I: "PARADISE" OF THE PACIFIC?

The State of Hawai'i, according to travel and vacation guides, is a traveler's "paradise" with exotic people, food, and beautiful beaches. Known as the "Aloha State," Hawai'i has been part of the United States since 1959 and is a playground for wealthy vacationers and home port for the Pacific Fleet of the United States Navy. On the surface this state seems to be a stable and a content member of the Union; however, this is only a facade. Hawai'i (and America) has a dark past which continues to influence the present. On January 17, 1993--one hundred years after the overthrow of Queen Lili'uokalani and the Kingdom of Hawai'i--a Commemoration was held to mark the illegal armed invasion of the sovereign nation of Hawai'i by the United States of America. This event became a flash point in the fight for Hawaiian Sovereignty, which over the years has had little attention from the rest of American society. Expressions of outrage and lamentation marked the Commemoration ceremonies as Kanaka Māoli (Native-Hawaiians) gathered together in solidarity as a colonized and subjugated people. On that day, 'Iolani Palace--former residence of Hawaiian Monarchs--was draped in black and served as a backdrop for the thousands who gathered with tears in their eyes and chants of lamentation and protest on their lips. This is the reality of Hawai'i's history--according to the Kanaka Māoli--the forced colonization and annexation of a sovereign and independent people to the United States.

An understanding of the colonial situation of Kanaka Māoli within their own homeland and their struggle for sovereignty frames our reading of *Light in the Crevice Never Seen* (1994), by Haunani-Kay Trask, as one of the very first literary works by an indigenous Hawaiian to be published on the mainland United States. Trask is a leader in the sovereignty movement as well as an educator and writer. This collection of poetry becomes an example of "resistance literature" akin to the writings of Pablo Neruda and Rigoberta Menchu in Latin America, and Naguib Mahfouz in the Middle East. Each of these writers have become the voice of the colonized and oppressed--a voice that has employed the literary medium as a political tool. Authors such as these have used prose and poetry as a means for both creating cohesion within a group and expressing political resistance. This is a foreign concept to the Western literary establishment which delineates a separation between art and politics. However, this is not an unusual occurrence in the cultures of indigenous peoples and those who suffer under the yoke of colonialism. Barbra Harlow in her study, *Resistance Literature* (1987), argues that "Poetry [literature] is capable not only of serving as a means for the expression of personal identity or even nationalist sentiment. Poetry [literature], as a part of the cultural institutions and historical existence of a people, is itself an arena of struggle" (33). As an "arena of struggle," literature becomes a medium through which opposing ideology and beliefs are juxtaposed to reveal a battle for dominance between these conflicting political discourses. Resistance literature, as discourse, attempts to reclaim a people's history, culture, and identity from their colonizers. The very nature of this kind of writing is rhetorical as it explicitly attempts to persuade its audience to join the battle.

Now, the question is raised: how does literature function to create hegemonic resistance? Hegemony refers to the dominant ideology functioning within a particular society, and thus, is the cause of oppression for those not in power. This hegemonic oppression is what resistance literature attempts to fight against and dismantle. The linguistic tactics and strategies used in the creation of resistance literature functions rhetorically. Thus, the answer lies in the province of rhetoric which discerns the nature of how language functions in the world. Rhetoric, argued Kenneth Burke, is based in an essential function of language, a symbolic means by which cooperation can be induced. The speaker, according to Burke, persuades an audience through the

168

use of symbolic action; drawing upon shared symbols in order to build a rapport with the audience (*A Rhetoric of Motives* 43). This essay will focus on Trask's work as rhetorical discourse, explicating the way language, specifically metaphors, is used to create the sentiment of resistance. I will argue that identity, solidarity, and resistance is shaped metaphorically. The specific objective of this essay is to demonstrate the advantages of metaphoric analysis as a means of articulating counter-hegemonic discourse by a Kanaka Māoli writer. To support my thesis, I turn to linguist George Lakoff and philosopher Mark Johnson's theory of metaphor found in their study, *Metaphors We Live By* (1980). They contend that metaphors are not purely stylistic devices; rather, they are integral to the way in which social reality and resistance discourse are constructed.

Lakoff and Johnson argue that "metaphor is pervasive in everyday life, not just in language but in thought and action. Our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphoric in nature" (3). Metaphor functions on the level of an enthymeme, drawing the audience into participating in the completion of the rhetorical construction. Enthymematic argument, according to Aristotle, is a primary form of public persuasion. This kind of argument relies upon shared cultural experiences by the audience to complete the proposed argument and to lend the rhetor credibility. In this study, the key to analyzing metaphor is found in looking at cultural experiences shared by native Hawaiians. For Haunani-Kay Trask the audience is her own people, the Kanaka Māoli, and she draws upon cultural metaphors and experiences in the construction of her resistance arguments.

A METAPHORIC ANALYSIS OF *LIGHT IN THE CREVICE NEVER SEEN*

Light in the Crevice Never Seen illustrates how resistance literature functions on a metaphoric level, creating a participatory, and thus, stronger argument for the reader to accept the case for resistance. Two general thematic metaphors were identified as being exemplary of how ideology can be used to create cohesion within a group and a counter-ideology against hegemony. The two metaphoric themes found were (1) death and destruction metaphors, and (2) life metaphors. Because language is shaped by cultural experience the experiences shared by the Kanaka Māoli are critical in shaping the language Trask uses.

Death and Destruction Metaphors.

Death and Destruction metaphors illustrate the great injustice and harm caused by American colonial oppression; they deal with the degradation suffered by the Kanaka Māoli. Trask uses various metaphors related to the main concept of death, which according to Lakoff and Johnson is an extension of the principle of experiential gestalts. This construction links distinct metaphors with a larger concept, lending to metaphoric cohesion. This occurs when distinct metaphors have similar functions within a particular discourse, supporting the larger category. The "system" of death metaphors includes (1) images of cold/weather, (2) animal images, and (3) images of a personified nature. These metaphors are taken from the Hawaiian cultural experience and are used to create a sense of community and identity within the native population. Trask also uses these metaphors to counter the dominant American ideology.

An example of the cold/weather metaphor can be found in the following passage:

nothing familiar in
the Arctic wind how
did this happen here?
my ill-clothed people
black hair freezing

in the American air
sores and frost on their tender
lungs, gasping for life
in our native Hawai'i (3)

The metaphor functioning here is the "Arctic wind," which represents the American presence in the islands. The "wind" is seen as a cold intrusion into the normally tropical weather of Hawai'i. However, beyond a physical level, the ideology of America is viewed as destructive to the Hawaiian people. This metaphor calls upon the current knowledge of the indigenous group which uses the foreign concept of "Arctic" to illustrate something negative. The use of this foreign term is justified by the fact that all Hawaiians have been taught English in the American school system. This, then, becomes a common term or experience in the cultural repository. White Americans are thought of as intruders who have "driven into the snow / God's justice white / death   white cold / cleansing the land / of blackness   sin" (43-44). The wind is cold and white, leading to the assumption that this wind of "death" comes from white (haole) people and their destructive ways.

The metaphor also functions by creating a community for indigenous people, as they are not equipped to handle the "American air," synonymous with "Arctic wind," both of which bring a "cold" death. The metaphoric allusion is extended to include a descriptive effect of the "Arctic wind" as it causes "sores and frost on their tender / lungs, gasping for life / in our native Hawai'i." This unnatural weather in the experience of the Hawaiian people has caused a form of suffocation, an oppression of their normal way of life. Metaphorically, Trask creates and highlights the experience of victimization within the culture by a colonial power.

Another death metaphor is generated through the use of animals. In particular, Trask uses the metaphor of a kōlea or Pacific golden plover to refer to haole people:

> The kōlea stilts its way
> through drooping ironwoods
> thickened by the fat
> of our land. It will eat
>
> ravenous, depart rich,
> return magnificent
> in blacks and golds.
>
> Haole plover
> plundering the archipelagoes
> of our world. (33-34)

The plover is a migratory bird that arrives in Hawai'i in August and then leaves for Alaska in May. In her notes after the poem, Trask describes the kōlea as "arriving as a thin, almost emaciated stilt [sic] but leaves fattened and beautiful" (38). In the Hawaiian culture the expression haole kī kōlea refers to a "plover-shooting white man," a descriptive expression used to delineate the contrast between the haole way of shooting birds and the Hawaiian way of capturing plovers without killing them. Today, based on the cultural context of the expression, any haoles "who exploit Hawai'i, especially developers and tourists, are referred to as kōlea by many Hawaiians" (38). This metaphor of the kōlea is extremely tied to the land and the culture and is linked with the experience of the Hawaiian community as a whole. Just like the plover who migrates to feed and be "thickened by the fat / of our land," the "Haole plover" ravages the islands of Hawai'i, leaving nothing for the indigenous inhabitants. The plover metaphor clearly counters the accepted impression of the benevolent and civilizing American presence. This metaphor reminds the native community of the loss of their culture, language and identity at the hands of the haole. The creation of both a cohesive community and a counter-ideology is exemplified in this metaphor.

The metaphoric images of cold/weather, animals, and a personified nature are all component parts of how the larger concept of death is structured within this example of resistance literature. Trask uses these death and destruction metaphors predominately in the first two sections of her work, illustrating the complex stages of her anti-colonial ideology. These sections "Chant of Lamentation" and "Raw, Swift, and Deadly" are focused on the destruction of the Hawaiian people and culture through expressions of outrage and anger. These metaphors are embedded in the Hawaiian cultural experience. Therefore, the indigenous audience is able to complete the metaphoric construction, and as a result, gain a sense of ownership over the idea and build a sense of community. The community created is one of shared loss and anger that fulfills the objective of resistance literature--rallying the people. Also, in the process of evoking a sense of community, these metaphors clearly indicate a counter-ideology to the American system, as it has been the cause of so much death and destruction in the Hawaiian community. This reappropriation of old metaphors by Trask serves to build upon shared experience and effectively promote an anti-colonial ideology that attempts to garner support for the sovereignty movement. Death and destruction metaphors ultimately challenge the dominant discourse of American colonialism by attacking the linguistic symbols at the heart of its power base and by creating new symbolic structures for the Hawaiian people.

Life Metaphors.

Trask's work also includes life metaphors, and their use evokes images of hope and renewal for the Hawaiian people. Again, Trask uses a plethora of metaphors related to a major concept. The system of life metaphors includes (1) light images, (2) sexual images, and (3) personification of nature. These metaphors are based in the Hawaiian conceptual system,

BEST COPY AVAILABLE

allowing Trask to build a sense of regeneration and rebirth of the Hawaiian land, people, and culture. The creation of hope for the lāhui (nation) is an essential function of these metaphors. However, they also help to spark action--a sense of personal responsibility in overcoming the colonial system.

The light metaphor which is particularly important in this discourse is that of "light in the crevice never seen" (75), which is also the title of the work. "[L]ight in the crevice never seen," is used as a metaphor in the poem "Ko'olau" to describe the hula (sacred dance) in Hawaiian culture and religion:

light in the crevice
never seen mosses
palai kāla'au
bamboo

crescent moon
stones
fragrant clack clack
from the shadows (75)

The hula itself is a metaphor, symbolizing the culture and spirituality of the Kanaka Māoli. "Palai" are ferns, sacred to Laka, the goddess of dance and "kāla'au" is a dance using sticks of bamboo. These images recall the familial structure of the cosmos which is expressed through the hula. "crescent moon / stones" refer to another instrument of dance which are held in the hands of the dancer and used to make clacking noises. These noises (and dance) are described as coming "from the shadows," indicating that the hula is a an example of the hidden culture which exists in the darkness, symbolizing life and spirituality of the people. The metaphor functions here to develop hope for the resurgence of the culture and of the traditional ways. The hula is a powerful cultural symbol which builds within the audience a desire for what has been lost.

Nature metaphors are also important in the development of the larger concept of life. The metaphor of the Taro (a starchy root that is the staple of the Hawaiian diet) is a personification of the natural world in the poem "Ko'olauloa:"

this earth glows the color
of my skin sunburnt
natives didn't fly

from far away
but sprouted whole through
velvet taro in the sweet mud

of this 'āina (80)

The taro is the mythical ancestor of the Hawaiian people who sprang forth from the 'āina (land). Thus, the Hawaiian people sprang from the land. This metaphor is a reminder of where the Kanaka Māoli came from and what claim they have to the land. This illustrates the cosmological bond that the Hawaiian people have with the land that ties them spiritually and historically to Hawai'i, but also, gives hope for the future. The association is made that since the taro still exists, then the Hawaiian people still have a connection to the land and therefore, must work towards liberation.

The images of light, sex, and a personified nature are components in the larger metaphoric concept of life. Trask uses these metaphors in the last section of her work completing the final stage in her anti-colonial ideology. Building on the first two sections that focus on death and destruction metaphors, this final section evokes images of hope and renewal for the Hawaiian people. The progression of metaphoric images in the first two sections rhetorically builds a community which is based on shared loss and anger over what has been done to the Kanaka Māoli and sets the foundation for action to be taken. However, it is in this last section where the images of regeneration and life are used to create a utopian vision of what Hawai'i can be again. Thus, the combination of anger and sadness with hope and renewal, creates a community of indigenous people who have a vision of what their home, culture and people can become. Along with the sense of community and a utopian vision of Hawai'i these life metaphors rhetorically attempt to incite action by the indigenous population to work towards this goal of liberation. Functioning as a whole, the cultural metaphors in Trask's work rhetorically creates a community and evokes action that is the heart of resistance literature.

CONCLUSION

"Metaphors" according to Lakoff and Johnson "create realities for us, especially social realities" and "may thus guide future actions" (156). The function of metaphoric analysis is to uncover the cultural and experiential factors on which the metaphoric construction is based. In this essay, the voice of an indigenous Hawaiian writer was analyzed for her use of metaphor to create enthymematic arguments woven into her poetry. For Haunani-Kay Trask the function of writing is to decolonize the Hawaiian mind and to leave a record of the resistance movement. Her use of poetry in particular lends itself to a metaphoric analysis, as she appropriates cultural metaphors to create cohesion within the native audience and to propagate her own ideological stance of resistance.

Trask's writing falls into the genre of resistance literature, which seeks to undermine the dominant ideology of colonial oppressors. In the case of Hawai'i, America is the colonial power which has subjugated the Hawaiian people and left them destitute both physically and spiritually. *Light in the Crevice Never Seen* is Trask's metaphorical and ideological "declaration of war." Any resistance movement needs an ideological basis from which to act. For the Kanaka Māoli, Trask's work becomes such a foundation, dispelling the myth that art does not have a real effect in the world. This work is both beautiful and powerful at the same time, creating a counter discourse to the dominant American ideology.

When dealing with resistance literature, studying the indigenous voice becomes critical, as they are often the group under colonial oppression. Resistance literature is propagated to oppressed masses and finds its popularity and power within this group. The resistance writer becomes the voice for and to the people. In this role he or she must use stories and experiences from the land in order to connect with the indigenous population. For Trask, the use of cultural metaphors specific to Hawai'i lends strength and credibility to her argument--creating both cohesion and a call to action in the fight for Hawaiian sovereignty. The progression of metaphoric images from death and destruction to life completes the stages of Trask's ideological "war." In the construction of these metaphors, the indigenous audience is drawn into the ideology argued by Trask and makes it their own through their participation. This participation is extended when the sense of ownership of the metaphor underlies the audience's desire for action to be taken. Thus, the audience takes ownership of the struggle and is rhetorically induced to fight for liberation. The ultimate goal of resistance literature is to create a cohesive community and to induce action by its members. Through the use of metaphor, Haunani-Kay Trask has fulfilled these objectives and has made *Light in the Crevice Never Seen* her "spear of memory" in the struggle for Hawaiian Sovereignty.

INTRODUCTION TO SEMIOTICS

The world can be viewed from many perspectives. Although people see the same objects, they may still interpret them differently. How people perceive things is influenced by semiotics. From a societal view, Webster's dictionary defines semiotics as "the science or language of signs" (Allee 286). Semiotics has been studied from many views. But, from a marketing perspective, Ferdinand de Sausaurer states that the definition of semiotics is "the science that studies the life of signs within society" (Winfred 174). To illustrate, if a person associates the color pink with girls, then when purchasing a gift for a girl, that person may look for a product with pink coloring.

The semiotics influence can be caused by many variables. One of the most important of these is personal experience or observed example. As people experience life, they are exposed to particular objects and learn how to react. Likewise, learning can also take place by viewing other people's reactions and behaviors in given situations. As a child is growing up, he or she is exposed to many new concepts. By watching his or her parents, the child learns to imitate behavior. But, most importantly to semiotics, the child also will mimick the parents' beliefs and attitudes toward objects. For instance, if a young girl is drawing pictures with her mother, and observes the mother drawing a heart to symbolize the feelings of love, then when the girl sees a heart again, she will correlate it with loving emotions. Based on consumption studies, marketers want one specific question answered: do symbols persuade goods and services purchases? Noth Winfred believes the answer to this question to be "yes." He suggests this example: "If inferences are thus made from goods (e.g., cars) to their users (e.g., their personality type) the commodities are interpreted as *indexical signs* . . . the public discourse *about* the commodity generates meanings which transform the commercial object into a sign. Once the consumer has learned its meanings, he or she is liable, at a certain level of consciousness to rediscover this sign on the marketplace" (Winfred 174). In other words, when the consumer sees the signs or objects in the marketplace that he or she has associated certain meanings to in his or her personal life, the consumers parallel these feelings and the sign takes on the meaning originally assigned to it. This report will focus on the following segments of semiotics: symbols, shape, font, and color. These will then be interpreted to show how they relate to the packaging of children's products and how marketers can take advantage of this information.

Variables in Semiotics

To begin with, different symbols can induce certain reactions or thoughts. Over time, objects can attain specific meanings. The heart (   ) symbol has come to mean "love." For example, there are bumper stickers that say "I   my dog." Marketers could use hearts on their packaging to create a sentiment toward a product. A doll's package could have a heart on it and portray warm feelings. Another symbol that has gained a universal meaning is a star (   ). The connotation with a star is positive. It can be used on a child's homework to show an excellent job has been done, or people often draw a star when they want to highlight an important idea. Some symbols can be used to show danger or be used as a warning. In fact, the skull and crossbones was originally used in pirate ships and on the pirates' flags. Today, the skull and crossbones is frequently utilized as a warning on harmful medicines or chemicals (   ). Since people see the skull and crossbones symbol analogous to that of danger, it is a reliable way to show hazardous materials. Marketers and artists have also used certain shapes to create specific feeling or give meanings to products. Over time, specific shapes have been paired with meanings to create certain moods or effects. The square has become a symbol of strength and masculinity due to its sharp edges and straight lines. The circle, on the other hand, often elicits feminine feelings: the circle may symbolize the "curves" of a woman or the more traditional role of woman as the sensitive and caring part of the species. Next, the triangle is the ultimate shape of stability. The base is wide and the weight is in the middle. The placement of lines on a page has also been paired with meanings due to the feelings the lines create. A vertical line represents strength and substantiality. The columns hold up the buildings and give a dignified influence. Horizontal lines give a feeling of peace or rest. Also, diagonal lines represent action or movement. Moods are also created through different display types, which are fonts, usually over 18 point, used to attract attention. For example, Roman typefaces give a feeling of dignity, austerity, and grace, just like early Roman inscriptions (Craig 137). EGYPTIAN TYPEFACES are forceful and insistent (137). San serif types, those without serifs, or little tails, are modern, and give a contemporary and efficient feeling (137), while serif types, such as the one being used, are more relaxed and flowing.

Other characteristics of symbolic representation also have influential attributes: the use of color has a semiotic effect. For instance, the color red has typically been associated with love, war and battle, danger, and alarm. Blue, on the other hand, has a cool feeling and is often associated with water and heaven. It also can be used to portray sad feelings, hence the phrase, "I feel blue." On the other extreme, navy blue may represent war. When one mixes the two previous colors (red and blue), the result is the color purple which expresses "royalty, self-sacrifice, depth and rage" (Sheet 7). Expressions of these can be used effectively by marketers to influence buyers that their product is superior or royal. Next, the color yellow also has significant meanings. Parallel to the other colors, yellow has positive and negative connotations. Positively, yellow suggests wealth, royalty, prosperity, and harvest. But, negatively, yellow suggests cowardice and sickness. Similarly, green portrays various meanings, and its name stems back to the word "growth or growing" (Spink 34). Since spring is a season where new life begins in plants, trees, and flowers, green has come to symbolize youth and rebirth (Spink 34). Unfavorably, green suggests envy and jealousy or immaturity. Next, black often represents everything that is evil or bad. In western movies, the "bad guys" always wore black attire. Some other places where black is found are as follows: at night, in caves, and in the color of bats. These reflect "death, crime, terror, mourning, dirty, [and] impure" (Sheet 7). The opposite of black is white which represents everything that is pure. The color white can be found in snow, sheets, clean laundry, Easter lilies, sacrificial animals (doves, oxen, lambs) which contain not a speck of color, and a white flag (Spink 40-41 and Sheet 7). Since white is seen as clean and pure, it suggests the following things: innocence, youth, and virginity. Because white expresses this, it is worn by girls who are getting confirmed and by brides. Also, because of the clean and pure aspects of the color white, it has been used extensively in the medical profession. Likewise, "akin to white as the color of innocence is its role as a symbol of friendship and peace" (Spink 41). In order to show peace a truce, or even to surrender, a white flag (as opposed to a black flag as suggested earlier with the pirates) is waved or flown.

History Of Children's Marketing

Now that the foundation of semiotics and some of the definitions are clarified, our attention can be turned to who is affected by semiotics and how they are affected. This paper takes an extensive look at how semiotics influences purchase decisions made by children and how marketers use semiotics on packages of children's toys to elicit certain feelings. To fully understand this, the children's market must be defined and completely understood--starting with a history of the children's market. The role of children as consumers has changed drastically over the past few decades. The 1960s viewed children primarily as influencers of consumption decisions made by parents. The 70s declared children as consumers in their own right when parents let children make their own purchase decisions. By the 1980s, child-based retail flourished as children consumers were placed on somewhat equal ground with adults. Now, marketers are spending a billion dollars a year on marketing communications aimed at children and marketing research is investing millions more a year to further tap this lucrative market (McNeal 4-6). After World War II and beginning with the baby boom, the attitude in the United States changed to "have fun, die young." Along with this attitude change came a certain self-centeredness that has carried into the 1990s and continues to grow stronger (McNeal 4).

Not only have historical events changed the role of children as consumers, but sociological factors also play an important role. The changing structure of the family offers us four main reasons for children to be identified as consumers. The first factor is the fact that there are fewer children per parent. As women became more career-oriented and gained more equality, the size of the family decreased. Thus, with fewer children and less time to spend with them, the children may get showered with attention and gifts. Secondly, there are fewer parents per child. The divorce rate has risen over the past few decades and it is no longer uncommon for single, unmarried individuals to raise children. These children are expected to fill in for absent adults and assume more responsibilities—including shopping. Deciding to have children later in life is another factor that leads to increased spending on individual children. Finally, the number of dual working families in the United States continues to grow. These families often have more money, but less time to spend with the kids.

Marketing Implications

The children's market is not simply viewed as 37 million young individuals (McNeal 14). Children spend over $6 billion annually and save about $2 billion annually. So, not only do they spend an enormous amount each year, but they also save money which will gain interest and be spent in the future. They will become consumers of all product categories as they grow older. Since one out of every five adults is an anti-shopper, it is important for marketers to make the shopping experience for children enjoyable so a positive attitude about shopping will be carried into the future (McNeal 15-16). Because children learn to shop at such a young age, the package is a critical part in identifying the product. In order to target children effectively, marketers must have packaging that children will understand and visually approve. The package must be an honest presentation of the product's features and it should use colors, words, and symbols that match the child's cognitive level (McNeal 194-197).

GENDER DIFFERENCES

Not only is it important to realize the importance and potential of the children's market, but it is important to realize the gender differences within the market. In society, girls and boys are treated differently from a young age, even by marketers. For example, Smith states that "By watching members of their own sex and then copying or modeling that behavior, children can discover how they are supposed to behave and feel" (323). This illustrates that children learn behavioral actions by example. Since advertisements and marketers "play" on these known actions, they can target the genders separately. Also, research shows that "through age four, children's activities were similar, but for the five- and six-year-old children, four significant differences in activities emerged" (Smith 326). The study showed that girls engaged in passive activities, while boys engaged in motor or active functions. If marketers use this technique in their packaging (showing girls in passive activities and boys in active situations), they will better parallel the tendencies of the market and attract a higher percentage of the market.

Gender differences may be natural, not strictly societal. In the article "Boys Vs. Girls," by Nancy Hall, she states that "boys and girls differ physiologically from birth, and such variations in hormones and brain structure probably account for the disparities in early childhood" (64). Research has even shown that boys are usually taller, heavier, and have more muscular strength when compared to girls (Hall 64). This could lead to the difference in children's aggression levels. Boys are more active and "are slightly more likely to engage in large motor behaviors," whereas, "girls engage in more expressive behaviors, such as vocalizing and smiling" (Hall 64). Boys and girls differ in many ways, although there are also many similarities. Children's marketers should utilize this information in order to better relate to the market.

METHODS

In order to determine which semiotic characteristics marketers use to influence children's purchasing decisions, primary research is necessary. By visiting a Toys R Us children's toy store, we will examine different products. To begin with, the population of our study is all children's toys available on the market today at the Toys R Us store in a city of 60,000 people in the Midwest. Due to the colossal number of products accessible today, it is necessary to take a sampling of the most popular products as opposed to studying the whole population. The products that generate a great deal of money from sales are ones that retailers give the most expensive and extensive shelf space (the closer to eye level or the consumer, the more it will cost), thus they are considered (for terms of this study) some of the more popular toys. Therefore, products with at least 10 feet (wide) of shelf space and at least three rows (high) will be chosen as individual examples. By collecting data from every 10th item of the most popular toys in the store, we will be able to narrow our scope and focus on specific items.

In addition to choosing every 10th item among the most popular toys, products will be further separated by the gender who buys the product most often. We will then analyze how marketers attempt to influence girls versus boys in the packaging of the toys. Utilizing the segments of the store, or studying the store layout is one way to decipher which toys are for boys and which are aimed at girls. Another way to choose which gender a toy is targeting is by who is pictured on the package design. Again using Barbie as an example, young girls are featured on the packages rather than boys. When the marketers show girls on the package, they are illustrating who they envision using their product. Also, children tend to imitate same-sex models with greater frequency than opposite-sex models so it would be logical that packages featuring girls in the pictures will be aimed at girls and vice versa (Smith 324).

This project will encompass studying and analyzing 80 different toys from the Toys R Us store. Of these 80, 35 of the toys are marketed primarily to boys, 35 will be marketed primarily to girls, and the other 10 are marketed to either boys or girls. Most importantly, the Toys R Us Chain has 45% of the children's U.S. toy sales. By having such a high percentage of the market, Toys R Us can afford to introduce new toys and products; an opportunity that smaller stores would have to pass up. This gives Toys R Us sales advantage since it has such a large variety in its products. To maintain consistency, all products will be tested using the same semiotic variables: symbols, shapes, font, and color. The literature research has given an informational background, but primary and functional research must be made. From this information we have concluded certain hypotheses:

H_1: Certain action symbols will be associated with boys, such as 💬 (used to illustrate talking) and ⇨ (used to show motion). Whereas, passive symbols will be used for girls, such as hearts.

H_2: The shapes that will be utilized most for boys will be bold squares, as opposed to the feminine circles and curves will be used more for girls.

H_3: The fonts used for girls will be more feminine in nature when compared to those for boys. For example, script may be used for girls. While, something more bold may be used for boys.

H_4: The colors that are used for girls will be softer pastels and pinks, whereas, the colors for boys will be darker colors like black, green and dark blue.

RESULTS AND DISCUSSION

After reviewing our results, we have come to the following realizations which toy marketers can implement in order to target gender groups. To begin with, certain symbols were found to be associated more often with specific gender groups. For example, the heart was found on eight girls packages and no boys packages. Based on our hypothesis, we predicted this to be true due to the association of love and caring with the heart. Females in general have been socialized to be able to express feelings much more freely than males. Therefore, the heart symbol can psychologically influence girls to parallel the product with their caring emotions; this in turn can lead to a purchase because of the effects of semiotics. The flower can be used in a way similar to the heart when marketing a girls' product. Flowers are natural and give off soft smells that convey feelings of peace and harmony. Men typically want to be rugged and aggresive--any association with flowers may contradict this image. Thus flowers can be used by marketers to influence girls, as opposed to boys, to purchase their products. Finally, the flash was determined to have a significant difference between marketing toward boys and girls. Ten boys' packages had a flash (🗨) symbol, whereas girls' packages featured only three of these symbols (in fact, one of the three was actually a sun). The points on the flash give a rough apperance, and the constant flow of the edge portrays motion and activity. In the first hypothesis, we also made reference to the fact that the symbols used for girls would be passive in nature, while boys' symbols would be active. The heart and flower symbols are very passive and had significant use on girls' packages which supports this hypothesis. We considered these symbols passive because they are generally not associated with physical activity. The flash, on the other hand, is active and was used often on boys' packages to indicate action.

In the second hypothosis, we predicted that rounded shapes would be used to target girls and pointy or sharp-edged shapes to target boys. Shapes such as the circle and square were predicted to be targeted towards girls and boys, respecively. However, this was not the case according to our results. We infer this is because the shapes are very commonly used and seen in every facet of life. Other shapes, including the triangle, rectangle, and oval are not as common as the circle and square which is why we feel that they better proved our hypothesis.

First, the triangle and rectangle have defined, hard edges. These both proved to be utilized more frequently on the packages aimed at boys. In fact, the triangle was not used on any of the girls' packages. From the previous shape discussion, the triangle is seen as a sign of stability. This sign may relate to and semiotically influence boys who have been socialized to see themselves as the stable partner or head-of-the-household.

While the diamond has hard edges, we feel that it was used to target girls on four packages and none on boys because of the correlation to jewelry. From an early age many girls hear the phrase, "a diamond is a girl's best friend." This phrase can influence girls to see the diamond as a positive attribute when purhcasing toys. On the other hand, if a boy would see this shape, he may react negatively and not buy the product. Boys have been culturalized to be "macho" and wearing jewelry is often seen as "girly" or "wimpy."

The oval, with its soft curves, gives a feminine feeling which is why is was mainly used on girls' packages. Traditionally, women have been seen as soft and caring, as well as having feminine curves. Even in cartoons and children's shows, children often see the male characters referring to females by making curvy or wavy hand gestures.

Next, the third hypothesis suggested that bold and boxy fonts would be used on the packages for boys; while, curvy and soft fonts would be used for girls' products. In our results, we found that outline (a more bold font) was used much more frequently on boys' products. To illustrate, outline was used almost twice as much for boys' packaging. On the contrary, girls' products put to use the serif type fonts four times as often. This font's tails give a script-appearance. Script was used on five of the girls' packages, while it was not used on any of the boys' products. Script or serif fonts are usually narrower fonts, while san serif vary in size or thinkness. The narrowness has the effect of a lighter, airy sensation which relates to how girls show their free-flowing emotions.

Lastly, color was tabulated with some interesting results!! To begin with, we must allude to the fact that we did not take into account all of the pastel colors, such as light purple. Although, we did include light blue and mint, because we analyzed girls' packages first. We noticed that the blues and greens were much lighter that the blues and greens on the boys' products. The mistake that we made was in assuming that purple would not be used for boys' products at all. So, when we noted girls' products with the color purple in them, we did not classify that most of them were truly pastel purple as opposed to dark purple. For the main product colors (primary color), pink was significance, the likelihood ratio came to .0000 because fifteen girls' products had it and boys had none. See Table 1.0 for exact data figures.

Table 1.0: Primary Color Results

	Pink			Purple			Black		
	No	Yes	Yes (%)	No	Yes	Yes (%)	No	Yes	Yes (%)
Girl	20	15	75.00%	25	10	40.00%	32	3	9.38%
Boy	35	0	0.00%	28	7	25.00%	25	10	40.00%
Unisex	9	1	11.11%	10	0	0.00%	6	4	66.67%

Significance (Likelihood Ratio)	
Pink	0.00000
Purple	0.05358
Black	0.00000

One specific example of this, was in the bicycle helmet section which was in a unisex aisle, located between the girl and boy sections of the store. The helmet that was labeled "Girl Helmet" was hot pink and had flowers on it. But, the boys' helmet was black with dark purple and dark blue streaks. Not only does this illustrate and support our hypothesis for color, but it also goes along with the passive and active aspects of the products. Once again, flowers are passively used to influence girls to purchase products, and active, moving streaks are used to influence boys.

The purple significance level was very close. We wanted to include this to show that had we differentiated between dark and light, the light purple would have probably been used significantly more with girls.

The last primary color that was of great significance was black. This strongly parallels our hypothesis that light colors would be used for girls, and dark colors would be used for boys. Not only did pink have a significance

BEST COPY AVAILABLE

level of 0.000 but black did as well. The contrast between these two colors is great, and the fact that they both scored as significant and mutually exclusive enforces the initial hypothesis.

As for secondary colors, red, green, orange, and black proved to be used more often on boys' packages than girls'. To begin with, red may have been used as a secondary color for boys because of its association with danger and war. This also follows closely with the active and passive relationship when evaluated against boys versus girls. See Table 2.0 for data statistics for secondary colors.

Table 2.0 Secondary Color Results

	Red			Green			Orange			Pink			Black		
	No	Yes	Yes (%)	No	Yes	Yes (%)	No	Yes	Yes (%)	No	Yes	Yes (%)	No	Yes	Yes (%)
Girl	32	3	9.38%	32	3	9.38%	35	0	0.00%	21	14	66.67%	33	2	6.06%
Boy	23	12	52.17%	25	10	40.00%	31	4	12.90%	32	3	9.38%	24	11	45.83%
Unisex	5	5	100.00%	6	4	66.67%	10	0	0.00%	8	2	25.00%	8	2	25.00%

Significance (Likelihood Ratio)

Red	0.00491
Green	0.03103
Orange	0.03197
Pink	0.00636
Black	0.01578

The fact that green was used more often for boys' packages than for girls' may be due to the traditional tendency for boys to be more competitive. One of green's semiotic interpretations is feelings of envy or jealousy. The competitive side of a boy may be triggered when viewing products with this color, and may in turn influence a purchase. Also, green may represent nature and the outdoors. Many of the boys' products are intended to be used outdoors and the green may stimulate instinctive outdoor inclinations.

To conclude our discussion, unisex packages are quite different from those of girls or boys. They have a high use of primary colors and had a low use of unique shapes or symbols. They seemed to have a more simple and classy appeal to them. A familiar example to most people is the Crayola package which mostly uses primary colors. The packaging is quite simple and consists mainly of a golden yellow color. Because these products are aimed at both genders, using the primary colors is a marketer's way to avoid packing color conflicts. To further illustrate, the majority of the sporting goods consisted of primary colors. This seems to be the first step toward gender equity in the toy market. Black was infrequently used, and pinks and light blues are emerging. However, we are not of the opinion that this will continue to change drastically or rapidly because boys' sports still get more attention when compared to girls'.

This paper is also a helpful tool for parents to inform their children of marketers' tactics. Not only should children be aware of the influences in their lives, but in order to help them make rational decisions, it is important to be aware and have all the packaging and semiotic knowledge possible. For instance, parents may wish to inform their children that marketers socialize girls to be associated with pink and boys to be associated with black. In order to help children have confidence and make their own decisions, these statistics can help. A situation may arise where a girl would want to purchase a "boy's" product. Instead of making her feel ashamed for wanting a product not meant for her gender, parents can inform their children that these choices are okay.

CONCLUSIONS

Overall, our hypotheses were supported by the statistical results that we compiled. In our opinions, color had the greatest effect and influence on children's packaging. It is apparent that marketers use different semiotic influences to target genders separately and also to target a unisex segment.

Marketers have extensive power over children's perceptions. By using this knowledge to their own advantage, marketers can persuade children to feel certain emotions which in turn will sway them to purchase their products over the competitors. Parents should also be aware of the tactics used by marketers to properly inform their children and make worthwhile purchase decisions.

Because semiotics can be such a strong influence, people need to remain aware of the world around them. Society will be constantly targeted by marketers today and in the future. By staying knowledgable and aware, they can help to ensure that the language of signs and semiotics will not be used against them.

Same-Sex Marriage Politics:
The Politicizing of Sexual Orientation

Phillip Voight

The radical feminist statement, "The Personal is Political" was once meant to test the boundaries of political discourse about women's rights by rejecting the present rhetoric and calling for a new perspective. Jean Bethke Elshtain writes in *Public Man, Private Woman*, "there are no neatly defined limits on the boundaries of politics. Boundary shifts in our understanding of 'the political' and hence of what is public and what is private have taken place throughout the history of Western life and thought" (201). The specific rhetoric surrounding women's work, women's role in society and family and the definition of women in general went through profound changes in the last century. The changes in rhetoric coincide with the overall politicizing of private issues into public policy concerns. "The relatively open-textured quality of politics means that innovative and revolutionary thinkers are those who declare politics to exist where politics was not thought to exist before. Should their reclassifications stick over time the meaning of politics – indeed of human life itself – may be transformed" (201). Feminists are one group of revolutionary thinkers whose impact has changed the meaning of politics as well as human life in significant and permanent ways. Today, the private issue of sexual orientation is emerging as another public, political reclassification.

The politicizing of sexual orientation began relatively recently in the United States, and has been seen in *presidential* discourse only within the last two election cycles. Although gay rights advocates have fought for equality for many years, the discussion of these issues on a presidential level indicates a movement into the mainstream political rhetoric of the United States. This paper will attempt to illuminate the politicizing of sexual orientation by examining presidential rhetoric on same-sex marriage. Same-sex marriage became an important political issue during the 1996 election cycle and provides a clear and up-to-date lens for viewing President Clinton's discourse on sexual orientation. Same-sex marriage is a complicated issue because there are many different types of public discourse involved. Judicial discourse can be found in the Hawaii sexual discrimination case. Legislative discourse can be found in the Defense of Marriage Act and the various state laws recently passed. Political discourse can be found in the election year posturing of the two major parties and various political analysts. And presidential discourse can be found in various messages from President Clinton and his surrogates. The common thread among these different types of discourse lies in Clinton's actions, position and rhetoric. The president can influence each area of public discourse, and his patterns of rhetoric can shape the *type* of debate within each sphere. Theoretical literature on presidential rhetoric identifies the president as a key player in the politicizing of sexual orientation because he plays a large role in same-sex marriage politics. Therefore, this paper acts as an initial attempt to summarize, analyze and crystallize the President's role in the politics of same-sex marriage. The research presented is designed to highlight President Clinton's action, position and rhetoric as a shaper of the issue.

Before diving into the analysis of the President, it is important to review the events that led to the election year activities. This issue originally entered the legal scene in 1991 when three same-sex couples sued the state of Hawaii for denying their marriage license applications. Hawaii's state constitution, as well as most other state constitutions, has an equal-protection clause that forbids discrimination "because of race, religion, sex or ancestry" but does not directly protect sexual orientation (Leo 19). The couples claimed in *Baehr v. Lewin* that denying them a marriage license was discrimination based on sex (Harris 106). In 1993, the Hawaii Supreme Court ruled that prohibiting same-sex couples from obtaining marriage licenses may violate this equal-protection clause (Stengel 52). The Court sent the case back to a lower court for trial and directed the State to show "compelling state interest" to justify the ban (Leo 19). The State was ordered to "articulate interests compelling enough to justify burdening the fundamental constitutional rights of due process and equal protection" (Harvard Law Review 118). Legal experts say this is one of the toughest legal standards. It is rarely met except in cases of national security or public safety (Boxall A4). Although the case is not finished, on Tuesday, December 3, 1996, Honolulu Circuit Court Judge Kevin Chang ordered Hawaii officials to stop denying marriage licenses to same-sex couples. Chang wrote that the state had "failed to present sufficient credible evidence... that the public interest in the well-being of children and families or the optimal development of children would be adversely affected by same-sex marriages" ("Judge Rules" A4). Chang put his ruling on hold while the State appeals the decision (Lawton A1). An appeal of the ruling will send the case back to the Hawaii Supreme Court (Dunford A5). This means that it will still be some time before same-sex couples will be able to get married in Hawaii.

In the mean time, legislatures all over the country pursued actions that would protect them if Hawaii ruled in favor of same-sex marriage. "In the heat of a Presidential campaign, an issue that lesbian and gay organizers had planned to advance much more deliberately has suddenly become a top priority" (Dunlap A12). Over 32 states looked at proposals to ban same-sex marriages and to prohibit recognition of same-sex marriages performed in other states (Kaplan & Klaidman 29). Sixteen states have passed laws and two GOP governors have signed executive orders banning gay marriages ("Judge Rules" A4). At the federal level, the U.S. Congress passed, and President Clinton signed, the Defense of Marriage Act which addresses two main issues. First, it says that states cannot be forced to recognize same-sex marriages performed in other states. Second, it defines marriage as the union of one man and one woman only (Barr 27). "Marriage so swiftly became the emblematic gay rights issue of the season that lesbian and gay organizers were left with little time to build political alliances" (Dunlap A12). The issue created a whirlwind of anti-gay politics and caught the gay and lesbian organizers off guard.

Eventually, these legislative measures could be judged unconstitutional due to the "full faith and credit" clause of the U.S. Constitution (Murray 30). Congress does have the power to determine the "effects" of this provision (Barr 27), but the ultimate decision concerning the constitutionality of these laws must be determined by the courts. "The courts will be asked to decide whether other states are obliged to recognize Hawaii same-sex marriages under federal constitutional requirements that states observe one another's official acts" (Boxall A4). So far, only Hawaii courts have addressed the issue as a constitutional right. The U.S. Congress and various states have taken preemptive measures to try to delay the legalizing process, but the real legal battle will continue to be waged throughout the nation, both in the courtroom, and the rooms of public discourse.

As the same-sex marriage issue gathered speed all over the country, the entire nation was interested in President Clinton's position. Bill Clinton has been characterized as the most pro-gay president in the history of the United States. He has "increased AIDS funding by tens of millions of dollars, granted security clearance to openly gay men and women, and endorsed measures such as the Employment Non-Discrimination Act" (Bono 43). Bob Hattoy, one of the openly gay White House aides, told the New York Times that he thinks the President will play an important part in the lasting picture of equality. He said "Bill Clinton has stuck with us through a lot of important issues and is capable of historical progress" (Clines A22). The President has also personally expressed his continued support for the gay and lesbian communities. At an informal press conference in the White House Rose Garden on June 7th, Clinton said, "I don't think any President has ever been as sensitive to the legitimate interests of gay Americans than I have. And I have been roundly criticized for it in many quarters" (Ayres A8). In a late June interview with *Advocate* magazine, a national gay and lesbian publication, he added "My administration has taken more steps than any previous in bringing the gay and lesbian communities to the table. I am proud of my record, and it is a record to build on" (Moss 46). Despite this history of support for homosexual advancement, the President has strongly expressed opposition to legalizing same-sex marriage. George Stephanopoulos, the President's senior advisor stated in early May that Mr. Clinton said in his 1992 campaign that he opposed same-sex marriages and therefore was merely reiterating long-held positions. He maintained that, "It never hurts you politically to stand by your positions, even if it causes some temporary disappointment among your supporters" (Rosenbaum A10). This position did become a controversial political move during the heat of the election.

The republicans were hoping for this controversy and temporary discomfort to throw a wedge in the president's campaign. Howard Fineman, political writer for Newsweek magazine, wrote that "In a distrustful age, a presidential election is less about inspiration than mayhem: locating popular issues that divide the enemy camp and cast your opponent as a cultural extremist" (30). The issue of same-sex marriage fits this strategy. Hattoy says, "To support same-sex marriage at this particular cultural moment in America is a loser" (Clines A22). A June 3, 1996 Newsweek Poll showed that while 84 percent of Americans say gays should have equal access to job opportunities, 54 percent say gay marriages should not be legally sanctioned (Kaplan & Klaidman 26,29). By increasing the visibility of the same-sex issue, republicans pressed the President into a corner where he had to choose either a liberal pro-same-sex marriage stand or maintain the middle ground against the tide of gay and lesbian critics. "Advocates of same-sex marriage maintain that conservatives forced their hand when they initiated a nationwide legislative drive to foreclose recognition of such marriages if they were legalized in any state. The object, these advocates contend, was to close off any meaningful discussion of the issue and to drive a wedge between the President and his gay supporters" (Dunlap A12). The President chose to hold the mainstream position and take the risk that his homosexual constituency would withdraw their support. Fineman asserts that Clinton "knew he could say no to same-sex marriage. Though gays have poured millions into Clinton's campaigns, the movement's leaders understand the numbers" (30). New York Times political analyst Todd Purdum further reported that White House aides acknowledge "their calculation that gay supporters would be unlikely to abandon Mr. Clinton over this issue" ("White House" B9) and "that they were eager to squelch it now" ("President" A1). The best political move for the President was to sign the bill and quickly move on to other, less controversial issues. White House press secretary, Michael D. McCurry, said, "The President believes the motives behind this bill are dubious and the sooner he gets this over with the better" (Purdum, "Gay Rights" A22).

The fact that this issue mushroomed during an election year is critical for interpreting the President's conduct. Purdum argues "the White House soft-pedaled the issue at every turn" ("Gay Rights" A22). This approach upset the gay and lesbian community, and was widely

criticized for its obvious nature as election year politics. The President's actions were clearly "intended to remove a potential controversy with republicans over a divisive social issue" (Purdum, "President" A1). Elizabeth Birch, executive director of the Human Rights Campaign, expressed her frustration over the Defense of Marriage Act by saying, "The bill is a ploy by the floundering 'Dole for President' campaign to drive a wedge between the gay community and President Clinton, and it's very disappointing and sad that he has felt the need to take the politically expedient way out." David Mixner, a California fund-raiser and old friend of Mr. Clinton's, added: "Both Harry Truman and J.F.K. were reluctantly drawn into the civil rights battle, but when they had to choose between political expediency and the moral high ground, both chose the moral high ground. Regrettably, this President has not" (Purdum, "President" B10). The political battle during this election cycle was a loss for proponents of same-sex marriage. Not only did the legislative battle mentioned earlier catch them off guard, but their most supportive president ever abandoned them in their hour of need.

The support for gay and lesbian issues was further eroded by the patterns of the President's rhetoric surrounding same-sex marriage. As the interview with *Advocate* magazine illustrates, there are two opposing sides of Clinton's rhetoric. For the more politically popular sexual orientation issues, Clinton uses liberal rhetoric. For same-sex marriage and other more controversial issues, he abandons his liberal position for more conservative rhetoric. For example, his answers on the specific issues of appointed positions, workplace equality, and AIDS funding as well as responses to general gay rights questions, repeated words such as "inclusion", "acceptance", "compassion", "tolerance", and "understanding" (Moss, "Interview" 46, 48). He appealed to common American values by saying, "We all want liberty and freedom. We want the embrace of family and community. We want to make the most of our own lives. That is why I've always said that our great diversity is a source of strength to unite – not divide – our country" (Moss, "Interview" 50). This rhetoric is consistent with his usual pro-gay position.

However, on questions concerning same-sex marriage, sexual education and adoption by same-sex couples, he used more traditionally conservative phrases such as "remain sensitive to the traditional values of our communities", "what is taught must be left to teachers, local school districts, parents, and students", and look "first to state and local governments, as well as the private sector, to consider issues like these involving community values and matters of conscience" (Moss, "Interview" 50, 52). These statements seem diametrically opposed to the previous ones and are indicative of a major rift in Clinton's politics on sexual orientation. The President's inconsistent messages about the various gay and lesbian issues renders his support for the gay rights movement as unstable and unreliable. This creates a state of political confusion about the status of sexual orientation in our nation's rhetoric. In a press interview during his 1992 campaign Clinton said, "My own view is that this should be a country that is free of discrimination.... [but] I don't think there should be affirmative steps to promote the homosexual lifestyle" (Moss, "Interview" 46). This inconsistency was further exemplified during the 1996 campaign season. Although he signed the Defense of Marriage Act, the President characterized the bill as "unnecessary and divisive" ("Senate's Votes" A22). Presidential Spokesman Michael McCurry stressed that this issue is a "nettlesome one for the President as he tries to balance the interests of a core constituency with those of moderate voters" (Purdum, "White House" B9). Rhetoric experts Karlyn Kohrs Campbell and Kathleen Hall Jamieson identify the importance of Presidential legislative messages in their text *Deeds Done in Words: Presidential Rhetoric and the Genres of Governance*. They focus on veto messages, but begin with an explanation of the various choices available to a president when presented with new legislation.

> A president can also sign without fanfare. This occurs most often when enactment is politically necessary but distasteful... they are likely to do so unobtrusively or to bury the act in a flurry of ceremonies celebrating the passage of more popular pieces of legislation. A president who disapproves of a piece of legislation but lacks a strong rationale for rejecting it or considers rejection politically inexpedient may allow a bill to become law without his signature.... Presidents also can register a formal protest when signing a bill into law or submit a message to Congress narrowing the interpretation of the act. (77, 78)

Clinton chose to sign the law late at night, therefore with little to no fanfare, and at the same time publicly protested the law. This middle ground position was indeed politically wise, but the White House pressed the issue further by not maintaining a quiet signing. The rhetoric used by Clinton and his surrogates both before and after the signing was filled with conservative messages. Repeatedly the President has been outspoken about his view that "marriage is an institution to be shared by a man and a woman" (Moss, "Wedding" 20). And McCurry said, "[The President] believes this is a time when we need to do things to strengthen the American family, and that's the reason why he's taken this position" (Purdum, "White House" B9). These statements are even more pervasive than the actual bill because they accentuate positions against sexual orientation equality and indicate a pattern in Clinton's rhetoric overall.

The evident transition toward the middle has become a key part of Clinton's politics. "After mocking Dan Quayle in 1992, Democrats have adopted family-values rhetoric with a vengeance.... Instead of advocating family values [Clinton] spoke of a 'government that values families,' then expanded that definition of the American family to include single-parent and homosexual alternatives" (Crabtree 8-9). One general problem with this rhetoric is that the continual use of conservative phrases confuses liberal interests with more conservative values.

Ed Miller, director of research at the conservative Polling Co., asserts that Clinton's "liberal base realizes that they have lost the rhetorical battle – that they will never get the president reelected by demanding that he talk like a liberal" (Crabtree 9). Hattoy further pointed out that people should not expect such a complex cultural issue to be settled in the flash of a Presidential campaign (Clines A22). This is exactly the reaction that many gay and lesbian leaders had to Clinton's decision to sign the Defense of Marriage Act. "Gay rights advocates have agreed to disagree with him on same-sex marriage" (Purdum, "President" B10). They've let Clinton's rhetoric go largely unattacked so that they can move on to other issues.

This reaction may prove to be deadly for the movement and is problematic for our nation in general because presidential rhetoric has tremendous power in shaping our national identity as well as our federal policies. The president is clearly an important figure in the same-sex marriage issue. His position and rhetoric have tremendous power to shape national opinion and the parameters of legal, political and rhetorical debates. Campbell and Jamieson write that the office of the president entails an important public rhetorical role. "Public communication is the medium through which the national fabric is woven" (6). State of the Union addresses, for example, offer one of many opportunities for the president to define this rhetorical national identity (54). These addresses specifically call for meditations on underlying communal values. "Public meditations exemplify the symbolic processes by which a collectivity of individuals comes to see itself as an entity – a group, a community, a nation – with an identity that unifies its members and distinguishes them as a group" (55).

The political rhetoric surrounding same-sex marriage is not the first issue that has challenged our national identity. As mentioned at the beginning of this paper, the struggle for women's rights also forced our politics to be reevaluated. "From the earliest colonial beginnings, the tenor and quality of politics in the United States have been reflected in the tenor and quality of our national public rhetoric" (Stuckey 27). The national public rhetoric in the case of same-sex marriage has in large part centered around Clinton's position and his decision to sign the Defense of Marriage Act. This is logical given the role of presidential rhetoric in shaping our public images. Whatever the president does will naturally draw national attention and can have drastic implications for the acceptance or rejection of legal and political rights. "The President has become the nation's chief storyteller, its interpreter-in-chief. He tells us stories about ourselves, and in so doing he tells us what sort of people we are, how we are constituted as a community. We take from him not only our policies but our national self-identity" (Stuckey 1). The identity currently being evaluated is possibly one that touches our long-held understandings of American history as one of accommodation, democratic freedom and moral integrity.

The issue pushes the boundaries of our sense-of-self in very specific ways. Edwin Black writes in *Rhetorical Questions: Studies of Public Discourse*, that "the issue of self-definition is commonly manifested as an urgent crisis" (23). The same-sex marriage issue has been called a crisis by many conservatives throughout this entire election cycle. "Conservative groups contended that permitting same-sex marriages would alter one of society's most fundamental institutions" ("House Panel" 447). The political smoke screen they created was intended to circumvent or even halt the evolution of this national identity. American University law professor Nancy Polikoff says "the fight for marriage rights has closed off any critique of the institution itself" (Dunlap A12). Polikoff argues that organizing society around sexually connected people may be the wrong approach entirely (Johnson 48). "The question is not, as opponents would have us believe, will marriage survive the legalization of same-gender partnerships? Instead, the questions are how do society and the state support stable households in a world where the composition of families is changing, and how might same-gender relationships contribute to that end?" (Johnson 50). These, admittedly more difficult questions, are not being addressed at all in the larger social debate about the issue.

This stagnation is undercutting the power of sexual orientation as a defining American issue. Nevertheless, the same-sex marriage issue has created tension throughout the nation and has been successful in sparking meaningful discussions. The current political meditations on marriage and family have produced the rhetorical definition of marriage as Clinton's phrase that "marriage is an institution to be shared by a man and a woman" (Moss, "Wedding" 20). Because of the Presidents' shaping power, Americans are therefore called to value heterosexual relationships – without any discussion on the importance of love, fidelity and lifetime commitment "When we say that presidents constitute the people, we mean that all presidents have the opportunity to persuade us to conceive of ourselves in ways compatible with their views of government and the world" (Campbell & Jamieson 5-6). That is exactly what is happening in the debate over same-sex marriage.

The larger debate about the value of family and marriage in our society has not yet been addressed at a national level. But because of the way our nation was created, it is likely that sexual orientation will eventually force America into the reevaluation process. This country was arguably the only country ever established with a specific purpose in mind. "The United States of America is a social unit that derives its identity primarily from a set of political convictions" (Black 40). Some have said that these convictions led to the most influential constitution in history and the most powerful society in the world. However, because these convictions are based on abstract principles, the particular national identity at any given instant is fluid and capable of evolving over time. "A social identity grounded on conviction may at any moment be the subject of moral choice. It can be relinquished in favor of an alternative social identity" (Black 45).

The issue of same-sex marriage is asking this country to make a choice – accommodation or tradition. "The acquisition of a social identity, then, is not only the relatively simple matter of embracing a term or a set of terms" (Black 50). Terms currently in question include the legal definition of marriage as one person to another person as opposed to one man to one woman. "It is, also, the infinitely more complex act of assimilating whole networks of affiliation, value, and vocabulary" (50). The entire notion of individual rights and familial happiness is up for debate. Black emphasizes the magnitude of this debate by saying that when "a substantial number of people confront together a choice of defining who they are, what they come finally to believe about themselves may leave its mark on history" (21). This is precisely why same-sex marriage and the presidential rhetoric surrounding this issue are so important. They may have tremendous impact on our future, and consequently, our history.

Therefore, when viewing this issue through the lens of rhetorical theory it becomes clear that presidential rhetoric about same-sex marriage is a powerful force in the politicizing of sexual orientation because it has the potential to create a particular national identity. Questionable legislation passed in an effort to forestall a judicial definition of marriage inclusive of same-sex couples was used as election year posturing. The president's response to this legislation and his repeated use of conservative rhetoric has defined the country as a nation concerned about the family and the breakdown of the institution of marriage. Gay and lesbian leaders would like a thorough evaluation of these aspects of society but the identity being maintained is one of conservative and unevolving positions. The tension between these two forces may eventually cause a great change in our society. This will happen only as sexual orientation becomes more and more politicized. As Elshtain demonstrates, the current revolutionary thinkers have already begun this process.

'Do As Little As Possible'
The Transformation of Film Noir's Myths in Chinatown

> "Hollywood likes to tease the audience, but the law always comes along at the end and kills the bad guy. It's not that way and I didn't want to film it that way."
>
> -Roman Polanski on Chinatown

Roman Polanski's Chinatown belongs to a group of films commonly referred to as the second generation of film noirs. Noir itself was considered to end by 1958 with Orson Welles' Touch of Evil. These films share similar attitudes regarding their presentation of a familiar formula. They do not simply imitate the noir characteristics, rather, they reinterpret these myths as it suits their purpose. Chinatown does this expertly, using the noir conventions to redefine and ultimately dismiss them. Polanski uses the old formulas self-consciously in order to lead the audience to realize his agenda; that of presenting these ideas as false and destructive. He wanted the film to be a look at the world of the 1930's through the technology and camera eye of the 1970's. The film is situated entirely within the genre; he wants to evoke a generic experience from the audience. He needs prior noir knowledge as a backdrop against which he can tear down its conventions.

Whether or not film noir is a genre or simply a style, there are certain characteristics that link all noirs together. As their name suggests, they are generally dark, both in lighting and in theme. Shadow and light play off each other and show contrasts. Noirs generally take place at night (Chinatown's climax). A big city is the usual setting, often Los Angeles (as is Chinatown). The use of a real city creates an open story, one that deals with contemporary social realities. The use of a fake city, that is a set, closes the story up, focusing it more on the festering neurosis of a character (Hirsch, 17). Chinatown incorporates both; the scene at Chinatown was a set, but many other scenes were shot on location, including the scene at the orange groves. Low and high angled shots are often employed in noirs; the former to show one character's power over another, the latter to emphasize a sense of impending doom. Chinatown uses such shots, most notably in scenes of J.J. Gittes (Jack Nicholson) tailing Hollis Mulwray (Darrell Zwerling). These stories are often told in flashback and/or voice over narration. While Chinatown lacks overt examples of each, the movie as a whole serves as a flashback, looking from the present onto the past in order to tell a story.

Noirs generally have three basic character types; the criminal, the femme fatale and the detective. For the most part, they center around a detective, invariably a man, on a quest for answers. He uncovers these truths through his own powers of observation and deduction. The hero has a code of honor that he must abide by, or he will become a victim of fate. Often this code corresponds to society's ideals, but not in all respects.

The motivation for the hero's quest is usually in the form of an encounter with a woman, usually a femme fatale. These women are cold, calculating and mysterious, never giving themselves completely to anyone. They shrink from familial roles such as wife or mother. They use their sexuality merely as a means to an end, usually money and/or power. Their intimacy is purely sexual; they do not need love. The only way these women are able to dominate men is through the use of their sexuality. They will use it without remorse, trapping and controlling men. In the end, these women typically are killed, arrested, ignored, or, realize the error of their ways and are reincorporated into society.

The criminal part of these stories is usually found in a transgressive male. These men are often effeminate foreigners. They are presented as less masculine than the detective and/or other males in the story. Physical presence is often downplayed, the criminal having a noticeable physical deformity; obesity, shortness, use of a cane, etc. Greed for money and power frequently motivate the criminal.

Although the general feeling of noirs is one of defeat and despair for the characters, there is always a sense of justice at the end. The characters have done wrong and deserve the punishment they received. Society rights the wrongs, law and order prevails. The audience leaves knowing that the criminal world they spent an hour and a half inhabiting was not able to sustain itself in the face of society. Criminals are punished, the good side wins. There is always a hint at the characters ability to make a go of it in the real world, outside the life of crime they explored briefly.

This is the aspect of film noir that Chinatown dismisses. It uses noir characterizations to render this transparent and in need of a reworking. Polanski counts on the fact that the audience has seen other noirs. He presents a familiar situation and lulls the audience into thinking that it will be like previous noirs they might have experienced. However, in the end, he demolishes the moral universe that noirs sought to establish. He felt that "the dramatic impact would be lost unless audiences left their seats with a sense of outrage at the injustice." (Polanski,348). It is as if Polanski is chiding the American public for ever having bought into the myths that noirs perpetuate. He says that individuals have no control over or say in their destinies; they are helpless bystanders.

"By upsetting the genre, Chinatown exposes the self-justifying structures through which the popular myths of our culture naturalize ideology" (Wexman, 106). Movies are often used to reinforce or even tell the public what they should think, feel, and do. Noirs did this repeatedly, showing promiscuous women to be dangerous, foreigners to be criminal, and only the lone detective was good. Chinatown shows the audience how not to think, and in doing so shows the audience where their previous ideologies were rooted. The "femme fatale" is not evil, the criminal is not foreign and the lone detective is ineffective. Justice does not prevail in the end. Order is not restored. The evil element is left free, with the hint that he will repeat his actions on a second generation.

Typical noir characterizations allow Polanski to prove the inadequacy of prior noirs. Chinatown involves a very complex, twisting, confusing plot born of one man's extreme greed. The woman is the catalyst for action, and is presented as embodying many characteristics of the femme fatale, while being more complex and human than her predecessors. The detective is almost completely noir, in attitudes and actions, but strikingly differs in his degree of success. However, in the end, the humanized female is killed, the detective is rendered impotent, and evil rules.

Evil is incarnated in the person of Noah Cross. He is the precipitating factor in each crime committed, both in the public and private spheres. Greed for power and money is his primary motivation, not any greater sense of good for the community. He had given up part of his power when Hollis Mulwray, his business partner, forced him to sell the water and power company to the public. When his daughter Evelyn ran to Mexico and married Hollis, Cross lost his power to exert control over her. He will not allow that power to slip through his hands again. Controlling water and his daughter/granddaughter, Katherine, (the product of his incestuous relationship with Evelyn) are his ways of insuring his power for the future.

Cross is reconciled to his past and has no regrets. In fact, he seems somewhat proud that he has done what most men can't even consider. Most people never have to deal with the fact that "Given the right time and right place, they are capable of anything." This could easily serve as a catch phrase for earlier noirs; they implied that all men held potential for criminal activity, that it was just below the surface. It only took an accidental occurrence to bring it to the foreground. Cross has given in to this noir idea and has never sought to escape it as earlier noir characters do. He strives for the reenactment of his earlier crimes.

Dominance is the power of Cross. He is able to dominate society by controlling their water supply. Cross also is able to exert power over the other characters. Evelyn becomes flustered and starts stammering whenever her father is mentioned. Gittes, much as he tries, is unable to dominate Cross. He is constantly pushed to the side of the frame when he is shown with Cross. Gittes, as the detective, goes to the Albacore Club to ask questions. Yet, it is Cross who dominates the conversation, mispronouncing Gittes' name and even ordering him to sit down.

Cross is unable to distinguish between public and private, seeing each much the same way. This duplicity of vision is represented by his bifocals. These glasses are what eventually lead Gittes to the truth. This double vision carries into his attitude about his business and his personal life. He did not want the public to own their own water because it would grant them more power than he had. In California, water is life. He is also able to see both his daughter and granddaughter as his lovers. The incestuous nature of his vision, both in private and public arenas, is represented by the smashed lens of his glasses.

Unlike older noirs, Cross is not depicted as "other" or alien in any way but dress. He helped build the city. He is not a foreigner, but is more transgressive than most noir criminals. This forces the audience to realize that evil dwells in their backyard. It is not just foreigners who deal in crime. It is those they deal with every day.

The portrayal of Evelyn Mulwray, Cross's daughter, also offers a dark twist to noir sensibilities. She is first presented as a typical femme fatale, in complete control of Gittes and the direction their relationship would take. Her observation of him while he was reciting a dirty joke, at the expense of the Chinese (with whom she is constantly aligned) shows her ability to fulfill the role of the gazer as well as being the object of the gaze.

Her next scene shows that, while she is still viewed as a femme fatale, she is becoming a three dimensional person as well. She starts off in control of the situation and Gittes, but ends by meekly saying "call first" to Gittes as he leaves. When Gittes brings up the young girl, she loses her composure.

Evelyn does show many other femme fatale characteristics, but these do not render her as pure black widow. In the end, these items are undermined. She admits to having frequent affairs and not being able to see anyone for very long, showing a freedom in sexuality apparent in previous noirs. However, once her past is discovered, the audience can sympathize with these statements. Her father's incestuous behavior would traumatize anyone. She is cool and reserved at first, but, by the end, she has relaxed and begun to open up to Gittes and the audience, much as is the case in any growing, real relationship.

She dominates Gittes, not sexually but in language and even in action. From the beginning, she ruled their mode of discourse, with Gittes changing his usual mode of speaking when she was around. He either stopped in the middle of a curse word to find a more "appropriate" one or he would apologize to her after using profanity. She had to translate "cherchez la femme" to him because he did not understand French, in spite of his earlier usage of it. She was able to lie to him on several occasions without his knowing immediately; he merely thought she was hiding something. She made fun of him, asking "Do you get it or is it too difficult for you?" and repeating his earlier line "I think I would have remembered" with clear ironic overtones.

She also dominates him several times by saving him. She saves him from a difficult situation by claiming she hired him. She picks him up at the orange groves where he was beaten up and knocked unconscious. At the rest home, he is able to jump into her car to make a getaway from the thugs.

She is complex, not just deceptive. She is a victim, not a victimizer. She has her reasons for keeping secrets and for once they are understandable. However, Polanski does not allow this complex woman to survive. His presentation of her as such shows the limited vision of earlier noirs. The audience, along with Gittes, are not able to see past her outside appearance of a femme fatale. She is three dimensional, not a creature born of evil intentions. She has been caught in a world that she is unable to escape. Earlier noir women deserved their punishment because they were evil. When Evelyn is killed, Polanski shows that the world is not as black and white as used to be thought. She is killed while trying to escape from her problems, problems she did not bring on herself.

The characterization of J.J. Gittes is where Polanski is able to present the ineffectual nature of most of the myths of film noir. Gittes embodies noir detective's values: he aspires to actions on a grand scale; is motivated by his ideals of courage, justice and altruism (when compared to Escobar, Looch, Cross); believes women and minorities and those associated with them are subordinate and often a cause of evil; is on his own to save himself from other's ideals; and is trying to at least resolve an isolated instance of injustice.

Polanski uses this formula and representation to question and ultimately dismiss these ideals as inadequate and destructive. Gittes is a failure; he is doomed to repeated failures in the same areas. He is caught in a cyclical history. He finds little out for himself; instead he is given direct clues by others. His chosen profession dictates that he spend his time observing others, but he is unable to deduce what is really going on.

It is obvious that Gittes has bought into the image of a femme fatale because he continually blames everything on Evelyn. He is stuck on the fact that she is holding back and does not take into consideration the amount of truth in what she did tell him. He cuts Evelyn off as she tries to explain to him and he offers his own solution, to which Evelyn readily agrees. His failure to extricate himself from the stereotypes of noir show it to be a limited vision. He does not believe anyone, much less a woman, could be in possession of greater knowledge than he.

While he jokes about his powers of observation, he does not observe all he should. He is unable to keep others from observing him and discovering truths about his character. Evelyn notices that "no question from you is innocent". The man in the barber shop comments on the derogatory nature of Gittes' work and causes a defensive reaction from him. Cross is able to see what Gittes' relationship with Evelyn will become. While Gittes is easy to figure out, the case is not. This explains his troubles with it. His vision will not allow him to see what he is not directly involved in.

Polanski forces the audience to identify with Gittes and his shortcomings. They travel through the case with him, sit in his back seat, look through the binoculars with him, and share his point of view. The "man with the knife" (Polanski in a cameo part;) speaks directly to the audience. When Gittes beats up Mulvehill, he cracks Mulvehill's head against the camera, making the audience aware of their participation in the movie. In as much as the audience is implicated as partaking in the look, Polanski invites an examination of "what it is like to get caught gawking" (Weschler, 92). The audience catches their breath as Gittes has to jump back to avoid being caught. Because they identify with him on a physical basis, they are forced into identification with him on a mental basis as well. When he fails, so has the audience.

Gittes is a sexist and a bigot, typical failings for noir detectives. However, Gittes' views are invalidated by his degree of dependence on these minorities. Evelyn saves his life twice. She supplies the answers to his questions. When she reveals that the glasses did not belong to Hollis, the audience and Gittes realize that the true source of corruption is not a woman. This invalidates Gittes prior idea that Evelyn was behind everything. To find the solution, he must return to Chinatown, a place where he has no influence on the outcome, where it is outside of his control.

It seems though that the rest of the world shares his views. Escobar believes Evelyn is behind everything. The cut on Gittes' nose could be taken to represent not only his failure as a detective, but also his flaw. In Chinatown, society is just as transgressive as the criminal, but their transgressions are accepted as the status quo. The other men in the film also have physical problems, showing that they share Gittes' beliefs about minorities. Both Lou and the overweight mortician have colds. The "weasel" at the Hall of Records has a boil. Mulvehill appears at the end with a bandage on his head. Polanski's thug and Looch are each shorter than average. Cross is aging and needs bifocals. None make any reference to a serious relationship with either men or women.

In the end, Gittes is impotent. Once again, while trying to save a woman he cares about, he succeeds only in getting her killed. His control over the world, as well as his powers of investigation, are merely illusory. Polanski shows the audience that noir traditions are ineffective and even destructive. He brings his audience into a comforting, familiar generic experience, only to change the formula and force a new ideology on the audience. He undermines the conventions of noir by playing within the genre itself. He destroys it from the inside out.

The private perspective holds space for the occupant's benefit and holding a surrounding area as part of the occupant's personal territory. Although public orientation sees space as available for anyone's use, the encroachment of personal or sacred space brings decisive action. Preservation of a private realm occurs as one withdraws from the intruder or asks the offender to move. In Taos Pueblo, protecting sacred space is a way of life. Sacred space is revealed in the Tewa's cosmology, symbolism, and architectural design.

The hazard of disregarding the cultural factors of space can be extremely costly. Tewan ancient instruction on the necessity of protecting sacred space concludes with a warning prophesy stating the Tewa tribal territory would be invaded by men who would eventually outnumber the native Americans. The Tewa are alerted to counter the invasion by resisting new ways (Miller, 104). Today, resistance to modern ways is manifested symbolically through adherence to early architectural philosophical ideals. Tribal council approval is required for placement of doors, windows, and any other structural changes (Ortiz, 44-45).

The Tewas' symbolic configurations are elaborate and follow spiritual co-centric circles. Understanding the symbolic process depends heavily upon pattern recognition (Harvey, 205, 209, 212). For example, Alfonzo Ortiz points out that Taos traditionalists use symbolism to delineate boundaries and define the center of their cosmology. Ortiz uses the example of a Taos painter beginning in the center and moving out to the borders to illustrate the necessity of boundaries and sacred center (Ortiz , 143). Through symbolism, Native American philosophy indicates that all things are considered living and united as one being. Nothing is inanimate. Traditionally, belief in natural harmony and relating architecture to sacred, functioning landscapes is an act of respect. There is no discrimination between man and nature. Pueblo natives use language appealing to the intellect, with meanings that cross over between architecture and sacred landscape. For example, *ye makini* means inner room as well as cavern; *te'wi* means set back on a mountain or bench in a *kiva*. There are no abstract terms for space and time. These words are only as valuable as defining the distance between two points (Hale, 104 -110).

Just as language indicates respect for sacred landscape, the manipulation of the watershed by the Tewa's brings reverence to focus. Red Willow Creek bisects the plaza at Taos. Similar to the creek, the Rio Grande River gorge cuts through the Taos plain. Taos Pueblo cosmology is further honored by echoing Blue Lake, found within the center of the Sacred Mountain. The entire watershed is sacred. As the Tribes attorney relates, "The watershed creates the Rio Pueblo de Taos. Blue Lake and the numerous sacred springs are the source of Red Willow Creek. The waters of the Rio give life to the watershed and to the Indians who dwell within. ... Blue Lake, as the principle source of the Rio Pueblo, is symbolically the source of all life; it is the retreat also of souls after death, the home of the ancestors who likewise gave life to people of today... Blue Lake, therefore symbolizes the unity and the continuity of the Pueblo." The Tribe recognized this lifeline centuries ago, prior to their 60 year struggle over returning their exclusive rights to the watershed. It is argued by Howard McCutchan that without exclusive rights, the intricate weave of Taos Pueblo will shred from the inside out by mining, decline of forests and Tourism (McCutchan, 86).

Other threads in the Taos weave concern the buildings themselves. As Suzanne Blier (2) and Alfonso Ortiz (86) agree, it is necessary to look at each building as an active, living organism. Since the Pueblo grows slowly in response to time and outside influences, artifacts are the best illustrations of Pueblo development. The walls surrounding sacred areas of the community are the most obvious example of artifactural evidence. This defense mechanism evolved from the Comanche raids of the 1700's. Its current use is a line of demarcation between public and sacred areas.

To further comprehend the Pueblo as an animate work of art, one must also understand the law of reciprocity as it pertains to pueblo architecture. Reciprocity is defined as a " mutual or cooperative interchange or relationship (Harvey III, 208)." Living within this law facilitates creation of sacred space in structures that mirror nature. Texture, color and shape link the Pueblo and Sacred Mountain and establish a natural reflection.

My first observation in 1994 revealed the pueblo sprawling in front of the Sacred Mountain. The structures appear to always have been there. The architecture echoes the surrounding arid, mountainous landscape. The plaza is within the pueblo as the valley is within the mountains. A wide, clear stream rushes through the center of what seems to be a parking lot. The open doors reveal limited views of shops and dwellings within. Large wooden poles horizontally embed the structure, resembling a tree line on the side of a mountain. Ancient manifestations reveal themselves, ranging from quite subtle to obvious correlation.

Ancient intent is visually implied within the very weave of the pueblo's architecture. Vincent Scully (48) describes the texture as one "of strawed adobe with that of grainy cedar." Hand sculpted clay was replaced with adobe brick walls after the arrival of the Spanish in the 1500's. The understated appearance of brick style changed the less formed appearance of the adobe wall to a coarser, more even appearance. This change also lent strength to the forms and provided a means to more easily modify the architecture. The adobe structures are repaired yearly in the same manner they have always been repaired, maintaining the man-made, soft lines.

The color of adobe compliments the encompassing landscape. The light tan/ beige appearance remains consistent, and visually connects the pueblo with the surrounding elements. At times the Pueblo glows golden against the background of the Sacred Mountain. The structures are established through color from the

189

mountain much the same way the mountain itself is part of the Sangria de Cristos Range. This overall impression is added by the shining windows and bits of green and blue colors from the mountain shadows. The Sacred Mountain supplies an inspirational background to the pueblo's confirmation: one much more dramatic than available photographs reveal (Personal analysis from photographs of Northern Pueblo by Kenneth Clayton).

Analysis suggests four major physical line directions presented within the pueblo configuration; vertical, horizontal, diagonal and round. Wood used for construction was stripped of bark and limbs then, post and lintel framework techniques were used. Ladders and framework, while honoring the trees, reinforce the impact of the grid. Line arrangements are dominated by horizontal pueblo roofs and the implied horizontallity of the mountain tops. Vertical slants of the framework act as a counter balance while diagonal lines of the mountainsides, ladders, and other structures add to the equilibrium. Photographs of the Pueblo suggest a pyramidal or box formation however, there are no absolutely straight lines. The exterior configuration of the community is softened by the roundness of corners, kiva walls, ovens, and natural timbers. Centuries of hand forming and smoothing have maintained a man-made earth from relating to the mountain. While the overall flow of the structure is fluent, photographic views of the North Pueblo expose divisional rock fractures between rooms which create recesses and ledges. Rocks placed around the foundation of the pueblo resemble a talus slope, furthering the correspondence with the Sacred Mountain (Personal analysis of Pueblo architecture by contrasting and comparing photographic evidence by Clayton and Scully).

The interior impression received is three dimensional. Immense logs, darkened by smoke and time, dominate the inner framework. One native artisan reminded me that the room we were standing in, as well as the aged framework, had been there since the beginning of time. I later understood his reference to time as Tewa genesis and not my cultures cosmology as a marking point for the architecture (Personal interview B. Hanson, October 1994).

Taos reciprocal relationship with the church of San Geronimo honors the sacred landscape. Although European in style, the church has adjusted within it's structure and color to resemble a snow capped mountain resting between two peaks. According to Scully (58), the portico is "overtly intended to echo the mountains profile. In this way the intrusive European attitude was deflated by Pueblo culture and drawn by it more naturally inclusive web of divinity." The white portico reflects the sun in much the same manner as the sun glistens off the mountain ridges (Personal analysis of San Geronimo using written and photographic evidence; Clayton and Scully).

From the very beginning of Taos recorded time, living within the law of reciprocity created a home in harmony with the environment. An intricate strategy of complicated symbolism was developed to protect the Pueblo. Manipulated patterns consisting of spiritual co-centric circles and elements of design establish their nature based cosmology. The Pueblo, feeding from the source of all life, grew throughout the centuries. Through persistent adherence to a prevailing philosophy, Taos Pueblo became an animate work of art.

Acknowledgments:

The author wishes to express her appreciation to Kenneth N. Clayton for the use of his original photographs in her research.

Cris Hassold

Cindy Sherman has claimed that her work is not a commentary on the masculine gaze, the feminine masquerade, or narcissism, yet all three issues are integral to an examination of her photographs. "...[Her] images are a critique of a world-view which sees the female body as coherent, beautiful, idealized and glamorized"(Day, 271). Whether or not she is addressing issues of gender is disputed by her critics. Ken Johnson claimed that, "becoming the Other, [Sherman] therapeutically releases the contents of psychic disturbance" through her roles of photographer and performer"(Johnson 53). What Johnson has failed to recognize, is that, because she is a woman, Sherman is already the Other. Margaret Iverson accepts this Otherness and argues that Sherman is searching for a means to "represent women without patriarchal precedents"(Iverson 52). Sherman may have this goal in mind, but her images also demonstrate the artist's awareness of the culturally constructed gender roles which are ingrained. Her very act of creation sets up the dichotomy between the active masculine and the passive feminine which recognizes that these constructs persist and must be manipulated.

It is important to recognize from the outset that by undertaking the role of photographer, Sherman has clearly taken an active/masculine position. This alone is not unusual, many women have chosen this active position of creation. Every woman is placed in this masculine position whenever she views any type of art work. The gaze is a power construct which is only applicable to active masculine characteristics.

The power to possess the gaze is formulated on desire for the viewed object. For the masculine, this desire requires a displacement of the primary love-object, the mother. Since it is the mother who is the first object of desire for the boy, he need only shift this desire onto the object of the gaze. For the female, however, desire is not such an easy process. Although the girl also begins with the mother as the primary love-object, the father quickly takes this role. Since the father is the possessor of the phallus, he is not an obtainable object of desire. The feminine recognizes that she is, like the mother, an object of desire. Thus, the feminine has no means of identifying the object of the gaze, except by identifying with that object. In order to possess the gaze, to feel desire rather than desired, the woman must take on a masculine role.

In this first approach to the artwork of Cindy Sherman her photography can be seen as a usurpation of the masculine gaze. In her photographs, Sherman maintains complete control over her medium, composing each photograph as a record of her own femininity. It is through her controlled composition that Sherman utilizes the masculine gaze in the presentation of a feminine spectacle. This is especially apparent in her early series, The Untitled Film Stills (late 1970's) and the Centerfolds (early 1980's) which are images of herself which Sherman composed by referencing depictions of women in the male dominated art of the cinema.

Sherman clearly poses herself in an awareness of the gaze in a number of the Film Stills. She often uses walls and doorframes to direct the gaze and as a frame, further distancing the viewer from the reality of the figure. She makes exceptional use of this device in Untitled Film Still #2 . On the left, the picture is cut by the frame of a door and on the right the viewer gets the edge of a shower curtain. What is most meaningful in this Still, however, is Sherman's use of the mirror. It is the mirror which lends an identity to the figure. Without the mirror, her face would not be visible, and the exaggerated motion of her right hand would not be clear. Sherman placed the pertinent information within the mirror; we understand that this is another woman obsessed and concerned with her own outward appearance. Here Sherman has consciously focused the viewer's gaze, playing it for her own purposes.

The later series, Centerfolds, explores a more psychological representation of the feminine. Attempting to replicate feelings of fear or longing, Sherman places herself in almost empty environments, assuring the primacy of the emotion as well as that of her body. She remains empowered through the masculine gaze, recording the emotional aspect of the feminine.

Sherman turns to the day dreaming figure in Untitled #96. Unlike the image from the Film Stills, this girl is not concerned with her self as a spectacle. Although she is physically there to be viewed, psychologically she is more deeply involved in herself. She may not openly acknowledge the gaze, but ultimately, these early images are created from an understanding that woman is an object to be seen.

It is the masculine who possesses the phallus (authority, action) the feminine is only lack. Nonetheless, the feminine plays an important role to the possessor of the phallus; her lack is a constant reminder that what he has might be lost. Thus, the feminine is appealing because she is subordinate, but at the same time she is threatening because she represents the potential of castration. If the feminine could actively participate in issues of control, such as the gaze, then the phallus would be meaningless, effectively castrated.

The gaze is the primary masculine power at stake in Sherman's art. It could be that she is placing the viewer in a masculine role in order to properly see the photographs. In this case, Sherman would be using the objectification of women to question the manner in which they are perceived in society. Her use of the gaze is foregrounded by her use of the masquerade. Sherman clearly is aware of the gender issues which define her as artist and as woman.

When a woman shows herself to be in possession of the phallus, as Sherman does by using the masculine gaze in her role as photographer, she fears retribution from the Father (i.e. the masculine possessor of the phallus). This is where the concept of the feminine masquerade comes into play. Sherman, at least in her early work, does not remove this masquerade, instead she utilizes it as the other half of her art work; her performance.

According to Joan Riviere, the masquerade is the means by which the feminine veils the phallus. The phallus, the symbol of power and activity is constructed as masculine, but this does not mean that a woman cannot obtain that power. Whenever a woman succeeds in a field which depends on intelligence or creativity, she is empowered with the phallus. Through that empowerment, the woman perceives herself to be a threat to the Father, so she fears punishment for her transgression. In order to hide this transgression, the woman must assume the "proper" feminine attributes. The masquerade consists of the woman's attempt to be sexually attractive to the male. In order to be an object of desire, she must cease to display phallic characteristics, becoming flirtatious in order to protect herself from the retribution.

Cindy Sherman's masquerade reflects her transgression of masculine power. As photographer, she makes use of the masculine power of the gaze and as performer she attempts to veil her transgression. In the majority of the series which Sherman has produced, she uses herself as the figure for each image, transforming her body into representations of many different types of women. In effect, she is offering herself as object of the gaze, using this masquerade to veil her simultaneous appropriation of masculine power.

In her enactment of the feminine masquerade, the artist tries on the various roles of femininity. The Film Stills are the first, timid step; allowing Sherman to experiment with the accepted feminine concerns of beauty and presentation. Film is the ideal place to begin addressing these concerns; cinematic images of women, especially those in Film Noir, consistently present the figure as a glossed over beauty. Sherman begins with the surface presentation, giving minimal attention to the underlying emotions. She focuses on the outer image because it is the aspect of the masquerade which first defines the perceptions of others.

In Untitled Film Still #6 Sherman lies prone on rumpled sheets. The mirror in her right hand represents her vanity, a common attribute of the feminine. She is an attractive figure, and the mirror suggests her own interest in her appearance. The vacant expression added to the skimpily clad figure's placement on the sheets indicates that she is in the midst of a private reverie, dreaming possibly of a sexual encounter. In effect, she has offered herself as an object to be seen and desired, rather than as a threatening, phallic woman.

The crucial question is "how to draw the line between genuine womanliness and the 'masquerade'"(Riviere 38). According to Riviere, there is no difference between the two. To be a woman is to be masked. She may masquerade in masculine or feminine personas, but woman in our phallo-centric culture is only not-male. Obviously, this is not an appealing thought to any woman, and in her later series, Sherman attempts to remove herself from the constraints of the masquerade. As she matured, Sherman continued to masquerade as spectacle in order to make up for her active masculine role of photographer, but she slowly began to erode these masks.

The exposure of the masquerade is evident in the Fantasy photographs and the Portraits. Sherman increasingly incorporates prosthetic appendages in these works, making no attempt to integrate them with her body. These false body parts first appeared in the Fantasy Series, in which Sherman's vision of the world seems to grow much more disturbing. Here she has no desire to masquerade, as though she is tired of the entire game. Instead she goes to lengths to make us notice her masquerade.

The masquerade is made visible in Untitled #216 one of the Portraits. The orb which substitutes for a breast cannot be rationalized away; even if it had been covered, it would not appear to be a normal breast. The masquerade cannot survive when its devices are revealed. Sherman seems to instinctively realize this, and consciously (at least in the Portraits) seeks to expose the accoutrements of the masquerade.

Her more current body of work moves a step further, completely taking her figure out of the issue. In the Mannequin Series, Sherman removes herself from the role of spectacle, thus ending her masquerade while developing statements on the nature of sexuality in general. Untitled #261 is an ambiguous image since the mannequin has both male and female attributes. By offering these confusing images, Sherman is able to reduce desire, and move her art work further from the issues of masculine activity and feminine spectacle.

The Mannequin Series also represents Sherman's move away from the narcissism which characterized her earlier works. Although her role as performer has been interpreted as feminine masquerade, there is also a clear narcissistic character to the Film Stills, the Centerfolds, and even the Portraits. No other figure would be adequate for the images Sherman wished to create. She manipulates her body into hundreds of different roles, but they are all remain pictures of Cindy Sherman.

As both performer and recorder, Sherman clearly focuses on the culturally perpetuated roles of femininity. Her early images seem to encourage voyeurism, allowing the viewer into the world of the subject without her knowledge. Yet, since it is Sherman herself, she is obviously aware of being watched; she has willingly made herself the spectacle.

Freud wrote that "the development of the ego consists in a departure from the primary narcisissism and results in a vigorous attempt to recover it" (Freud 121). Sherman's work is self-reflective; she seems to be searching for that lost narcissism, consistently using herself as the subject, but varying each character. It is not that any one of these images defines who Sherman is, or even who she wants to be. No one of the images will perfectly capture the person, but nonetheless, they are all pictures of Cindy Sherman. Taken as a whole, these untitled portraits serve to demonstrate the many roles of woman in society, while they also depict Sherman's own fascination with herself.

As Sherman's work moves away from the masquerade, exposing it, Sherman herself seems to move away from her narcissistic tendencies. In the _Fantasy Series_ and the _Portrait Series_, Sherman begins to change how she composes her photographs. Instead of direct images of herself, Sherman chose to subordinate her figure in a number of the _Fantasy_ images. At first glance, _Untitled #175_ appears to be the aftermath of a bulimic orgy, without sign of the perpetrator. However, Cindy Sherman is seen as a reflection in the sunglasses that lie among the debris. Unlike her previous works, this image of Sherman does not evoke any sort of sexual desire, instead the image is repulsive. Like a number of other images in this series, _Untitled #175_ is a comment on women's relations to consumer culture. Sherman does not want the image to be attractive; it is possible that she no longer wants to present herself as attractive.

Even when she is the center of the composition, Sherman often uses extreme costume and makeup effects, turning herself into witches, monsters, and mythical figures (female and male). Her body is less the subject of these compositions and has become a means to create an interesting image. This is not to say that Sherman was not always concerned with producing an interesting image, but that her earlier works show a greater interest specifically in her body image and figure.

Sherman began working with mannequins because she was tired of photographing herself and did not wish to photograph anyone else. Thus, the mannequins become Cindy Sherman, manipulating the body far beyond the true capacities of any human. With this definite turn away from narcissism, Sherman abandons her performance of the masquerade, yet continues to utilize the masculine gaze in her role as photographer.

It is at the point that she ends the masquerade and turns away from her narcissism that Cindy Sherman's work moves away from the traditional gender roles which dominate our culture. Clearly, by replacing her figure with oddly arranged mannequin parts, Sherman has also removed the object of desire from her images. This is exaggerated by the fact that the _Mannequin Series_ focuses on far more eroticized imagery than the earlier series. Despite the sexual nature of the subjects, it is not likely that a viewer would desire this collection of parts as he would desire a woman. By altering the discourse on the topic of sexuality, Sherman has succeeded in diminishing the power of the masculine gaze. The gaze cannot be destroyed. It is a cultural construct which is ingrained and when the object to be desired ceases to be desirable the power must certainly lessen.

Throughout her career, Cindy Sherman has struggled with the issues of gender which affect relations between the sexes. Her photographs reflect the position of most women in our society; trapped into feminine and masculine constructs of personality and power. Like many women, Sherman does not seem satisfied with masking her masculine activities with an assumed feminine identity. It may not be possible for anyone to find a set identity which is not limited by culture's gender constructs, but it seems that women are especially disadvantaged. In our patriarchal culture women are only negatives and in order to accomplish change, they must take a masculine position but then immediately redeem themselves in the masquerade. Sherman, like many contemporary women, must find the medium point where she can be accepted as a woman, carrying out the feminine masquerade, while exercising actual power, and moving into the masculine domain.

Reinterpreting Roman Morality

Dr. Marleen Flory

Modern pop culture and Christian apologists and moralists have traditionally portrayed the ancient Romans as having decadent, excessive, and immoral sexual habits. Taking historical texts at face value would lead one to agree with this assessment, but a closer examination of sources shows many Romans of late antiquity upheld, or attempted to uphold, the moral values of their ancestors.

ROMAN HISTORICAL TEXTS

Traditionally, one of the most revealing sources of Roman sexual morality was histories written by the Romans themselves; for example, the histories of Livy and Tacitus. Both of them wrote their works during the empire, although they also both had a longing for the republic, which is easily noticeable in their works. Tacitus' description of the emperor Tiberius is an excellent example of imperial Rome's immoral image:

> On this island [Capreae] then, in twelve spacious, separately named villas, Tiberius took up residence. His former absorption in state affairs ended. Instead he spent his time in secret orgies, or in idle malevolent thoughts.[1]

Both Livy and Tacitus represent Roman history in general decline since Romulus. Livy depicts the early republic as the pinnacle of Rome, which is evident from Livy's writings on the subject. Livy's and Tacitus' outlook causes them to continually compare contemporary events to past events. They are out of touch with the times in which they lived; they lived in the past, not the present:

> I shall find antiquity a rewarding study, if only because, while I am absorbed in it, I shall be able to turn my eyes from the troubles which for so long have tormented the modern world, and to write without any of that over-anxious consideration which may well plague a writer on contemporary life, even if it does not lead him to conceal the truth.[2]

Their outlook on history was also quite different from our modern concept of an objective history for both believed history should be a means of teaching morals:

> I would then have him [the reader] trace the process of our moral decline, to watch, first, the sinking of the foundations of morality as the old teaching was allowed to lapse...and the dark dawning of our modern day when we can neither endure our vices not face the remedies needed to cure them. The study of history is the best medicine for a sick mind.[3]

The idea of a moral history is not the only factor resulting in Roman historians depicting their culture as base and immoral. *The Politics of Immorality in Ancient Rome* by Catherine Edwards explores a more political interpretation of the historians' motivations. She explains attacks on immorality as a means to keep the elite defined and separate from the rest of society.[4] The Roman morality of the elite was not regulated or

defined by an authoritative institution--like the Christian church is today--but was instead internalized by members of the society. Because Roman morality was internalized, morality was arbitrary, and, therefore, needed to be defined often by public figures like Livy, Tacitus, and Seneca. The existence of an arbitrary Roman code of conduct was a means by which one Roman was subjected to the power of another through his definition of the code. Therefore, Roman morality was a power wielded by some Romans to empower themselves and disempower others. The social standing of many Roman "moralizers" attests to this. The most stringent "moralizer" of Roman history--as much mythical as historical due to later "moralizers"--was Cato the Elder. Cato was a *novus vir* or "new man" as was Cicero. They made themselves powerful forces in the senate by redefining the Roman elite and its morality. They did this through aspects other than their ancestry, such as wealth or personal abilities. Others who defined morality had similar low beginnings. Horace was the son of a freedman, the Senecas were from Spain, the Plinys were from Transalpine Gaul,[5] and Tacitus was also from the provinces, possibly France or Cisalpine Gaul.[6]

Overall, the Roman historical texts point to a use of accusations of immorality to empower the authors and to give evidence to the idea of Roman decline, which may or may not be historically correct. The "moralizers," by glorifying the past, made their contemporary world appear inferior. They depicted Rome as such to make the populace aware of themselves as inheritors of a great civilization and as impious children who are unable to emulate their forefathers' high standards. Therefore, the historian held a place in society closer to a social critic than an archivist.

ROMAN PORNOGRAPHY

One medium that gives us an indication of Roman sexuality is pornography. There were different types of pornography in ancient times, but the one that comes closest to out modern conception of pornography are works done by *an-aiskhunto-graphyoi* or "writers of shameless things." The texts were restricted to manuals for sex. The manuals primarily contain schemata for intercourse, although there are parts on seduction and perhaps oral sex.[7] The earliest accounts date from the 3rd and 4th centuries BC from Greece, but continue into Roman times and beyond. During the times in which they were produced and especially during the Christian period, the texts were considered luxurious because they only listed possibilities and did not counsel the reader about moderation.[8] Thus, the guide could only lead to weak, self-indulgent behavior that was characterized as "feminine." Because of this association between these texts and femininity, the material was considered soft and indulgent, and was the base form of pornography by which all others were judged. Although the material content of the "handbook" texts was feminine and irrational/uncontrolled, the existence of the genre--which was read predominately by men--allowed men to rationalize and "masculinize" sex by making it logical as if it were a mechanical process or a baking recipe. This rationalization of sex gave men a logical view and, consequently, the power to understand sex, i.e., the knowledgeable power to overcome the irrationality of sex.[9]

ROMAN MEDICAL TEXTS

The medical records from antiquity are excellent resources for understanding Roman morality. As pointed out in *Porneia* by Rouselle, medical texts gives us an indication of how sex was viewed in everyday life. This is because medicine is a human understanding of the body, not a supernatural or philosophical explanation. The way doctors in antiquity viewed the body functions as a good paradigm for the way in which all Roman society viewed the body.[10] In their thinking, Romans clearly made a mind-

body split. The body had its wants and needs which were in often conflict with the wants and needs of the mind. The body had to be conditioned so as not to interfere with the high aspirations of the mind. The Romans believed in administering the body only for its own health to release the mind from the body's drudgery. This a-matter-a-fact attitude about the body does not mean that there was not anxiety about desire in Roman medicine and philosophy:

> Passion for another's body disturbed, obsessed, and obstructed reason and the freedom of the mind...it was considered important to dissociate the mind from physical desire. The medical writers of the time echoed this view, and the scholars and politicians, like the philosophers before them, agreed that desire should not be allowed to intrude into intellectual or political life.[11]

This quotation shows how the body fit into Roman morality, i.e., a personalized morality regulated by and centered around the individual. Therefore, one measure of a man's moral worth was how much he regulated his body. The workings of this principle are most observable through sex, which sometimes led pagans like Julian and Sophocles to chastity:

> ...[H]e [Julian] was so conspicuous for inviolate chastity that after the loss of his first wife it is well known that he never gave a thought to love: bearing in mind what we read in Plato, that Sophocles, the tragic poet, when he was asked, at a great age, whether he still had congress with women, said no, adding that he was glad he had escaped from this passion as from some mad and cruel master. Also, to give greater strength to this principle, Julian often repeated the saying of the lyric poet Bacchylides, whom he delighted to read, who declares that as a skillful painter gives a face to beauty, just so chastity gives charm to a life of high aims. ...[T]his kind of self-restraint was made still greater through his [Julian's] moderation in eating and sleeping, which he strictly observed both at home and abroad.[12]

Julian's chastity was based not only on the idea of a personal moral code but also on certain medical principles which mainly concluded that sex was unhealthy. First, ancient doctors believed men to be distinguished by an internal "heat," giving them their masculine attributes. Because men had more "heat" than women, they were more aggressive, intelligent, and able. The ejaculation of semen was though to release this heat, and, therefore, make a man more feminine or "cool." Second, sex was considered dangerous for it involved an orgasm of uncontrolled convulsions. The convulsions were considered necessary for they were believed to have shaken a man's blood up into a white foam or semen. Yet, the orgasm was dangerous because it resembled an epileptic seizure. The production semen gave evidence to this belief since semen was considered analogous to the white foam appearing from the mouth of an epileptic.

Overall, the medical texts suggest sex to be unhealthy,[13] calling on men strictly to regulate their sexual lives, which entails maximum abstention from intercourse but still allows for a great possibility of pregnancy. After all, Rome was built around the family; being completely chaste and not having any children would have gone against an important societal norm. Roman men--especially those of the upper-classes who needed an heir--strictly regulated their diets and instances of intercourse to ensure pregnancy. Men ate certain "cool" foods to retain their sperm for too much heat would destroy it: lettuce, melons, berries, and cucumbers.[14] They also abstained from sex until the most opportune time for fertilization. Soranus believed the ideal time for intercourse was in the evening after a woman's menstrual period. After ejaculation, the woman should have crossed her legs and stayed in bed for a few days to be guaranteed of conceiving.[15] The arduous process the Romans went through to procreate demonstrates to what ends the Romans would go to regulate their lives for a health ideal and a moral ideal.

[12] Ammianus Marcellinus, *History*, books XXV, 4, 2-4. Cited by Rouselle, (above, n.10), p. 7.

[13] Soranus, a Greek physician, disagreed with his colleagues on this point. He argued, in the debate over hysteria, that virginity and continence are unhealthy and sex in moderation could cure this disease. Galen, on the other hand, believed chastity to be the highest good. He went so far as theorize that an athlete would be superhuman if he castrated himself for this would cause all his internal "heat" to be kept within himself. See Galen, *de semine* 1.8, Kuhn, p. 571. Coincidently, Artemidorus, who wrote *The Interpretation of Dreams* alluded to the same idea, quoted by Michel Foucault in *The Care of the Self*: "[H]e dreamed that he cut off his genitals, bound his head and was crowned [as a victor]...As long as he remained a virgin, his althletic career was brilliant and distinguished. But once he began to have sexual intercourse, he ended his career ingloriously (p. 16)."

CONCLUSION

The Roman patron was the target of "moralizing" throughout the Roman republic and empire because he held the only "active" or "autonomous" role in Roman society; he could alter his situation if he chose to do so, whereas women, slaves, and children were "passive" in that they could not. The individual morality of the patron gave not only himself but also all these "passive" members of his household their individual character. The character and morality cultivated by the patron defined his household's level of respectability and success. Therefore, it was logical for a patron to follow the "moralizers" example.

Also, the "passive" characters in Roman society, and many of the "active" members as well, were not in the practical position to be immoral. Only the Roman patron had a position from which he could take advantage of others; it was perfectly legal for a Roman man to do what he wanted with his "property," which included all those who were part of his household. Yet, in a world Peter Brown has referred to as "a society that was more helplessly exposed to death than is even the most afflicted underdeveloped country in the modern world,"[16] only a fraction of men could be part of the elite. Only a fraction of men had the time and the wealth to be immoral.

The evidence and theories presented in the paper do not prove the Romans were moral people. It is impossible to prove that the Romans followed all the advice of the doctors and exhortations of the "moralizers." Instead, this paper simple shows that the Romans had an acute concern about moral issues and about upholding the moral "greatness" of their ancestors.

Edna St. Vincent Millay: A Feminine Perception of Love

Mandy C. Carlson
Department of English and Linguistics
Northern State University
1200 S. Jay St.
Aberdeen, S.D. 57401

Lysbeth Em Benkert and Jay Ruud

Edna St. Vincent Millay presents her version of the love sonnet in "I, Being Born a Women and Distressed," but it is far from being a Shakespearean backslide into obsessive idolatry. Shakespeare's sonnets represent two separate states of love - bliss and misery. From Shakespeare's point of view, life is not worth living if you are a single person without sexual love and offspring, "Make thee another self, for love of me,/That beauty still may live in thine or thee" (Sonnet 10); any state of being, whether in bliss or in misery is all worth it when you are with the one person you love, "but if thou live remembered not to be,/Die single, and thine image dies with thee" (Sonnet 3). A love is supposed to be the center of your world, making it revolve, change seasons, determine the weather, sustain all that matters in life. These five aspects of love are presented in Shakespeare's Sonnet 14:

> Not from the stars do I my judgment pluck,
> And yet methinks I have astronomy-
> But not to tell of good or evil luck,
> Of plagues, of deaths, or of seasons' quality;
> Nor can I fortune to brief minutes tell,
> 'Pointing to each his thunder, rain, and wind,
> Or say with princes if it shall go well
> by oft predict that I in heaven find.
> But from thine eyes my knowledge I derive,
> And, constant stars, in them I read such art
> As truth and beauty shall together thrive
> If from thyself to store thou wouldst convert
>   Or else of thee this I prognosticate
>   Thy end is truth's and beauty's doom and date.

The world is perceived through the eyes of two lovers. The entire universe revolves around two people, a man, a woman, and the love that they share. Love is the largest object in their universe. Smaller entities like seasons, weather, and time only provide for the material well-being of these two people. These elements merely fade into the background when compared with the romantic relationship. It is as if the lovers are metaphorically living on the love they have for each other rather than on the world that is supposed to provide them with everything they need to realistically stay alive. Love is all that matters. Love means everything because there is nothing else. This idea falls nothing short of the fatal Romeo and Juliet scenario in the last line, "Thy end is truth's and beauty's doom and date." In other words, all that comes from perpetual loneliness and loss of love, is a bleak death.

Does love really need to go to such desperate ends? No. At least it doesn't if you can save your life by reading the opposing Edna St. Vincent Millay. Millay, in contrast to Shakespeare, establishes her independence by examining the reality of her situation. As a woman, she questions society's rigid and idealistic expectations of the love two people are supposed to give to one another. The idea of giving up her individuality by blending herself with another does not appeal to her. The poem is uplifting in a personal sense because it shatters the image of the fatal, sacrificial lover. Millay takes on the challenge of a more modern perspective of love in which partners are separate and equal individuals. Neither could be considered a slave to the other. In the early twentieth century, society was becoming more open to equality, and in the process of these changes, perspectives on the age old concept of love also change. Edna S. Vincent Millay becomes a poet beyond her time, and possibly beyond the time that we are presently in. Millay challenges her readers and her critics as she rebels against unrealistic standards of love and poetic art in her society.

Critic Jane Stanbrough believes that Millay's sense of independence is captivating as it, flows through lines that do not fail to take liberties. In the early twentieth century, Millay took certain freedoms in expressing somewhat controversial feminist and socialist ideals. At this time, people were uncomfortable with such expansive new ideas on how men and women should be governed, and thus uncomfortable with Millay's poetic belligerence on these subjects. This is a woman who became a notorious figure, a legend in the making. She published poetry, was an impressive actress, and a dramatist of growing reputation. In all her pursuits, she impudently flaunted her independence, establishing a reputation even before she entered Greenwich Village in New York. At Vassar, her almer mater, Millay had distinguished herself as a defiant public figure, smoking against the rules, cutting classes that were boring, earning a severe reprimand from college officials, one that nearly bereft her of her graduation ceremony (213).

Critic John Timberman Newcomb cites that some of Millay's critics were clearly opposed to her use of the traditional sonnet. They attempted undermine her work by trying to homogenize and control definitions of "modern poetry" in two ways: by questioning a female's comprehension of personal or serious issues, and by denying the use of poetry as a source of political power (270-71). In questioning women's knowledge about personal and social issues, the critics reflect the social inequality and oppression of women that Millay most criticizes. By denying the value of Millay's poetry, the critics parallel the typical historic public perception of women. In the 1920s and 1930s, women were denied the right to vote for the very same reasons Millay was denied as a poet. Millay's critics rendered her poetry politically powerless because they could not see women, her possible readers, as politically motivated, intelligent, or concerned about serious political issues.

The persona of Millay's love figure, in "I, Being Born a Woman and Distressed," is exemplified in the word distress, which defined by Webster's Dictionary, means: "considerable mental or physical discomfort from pain." The woman feels discomfort as she is controlled, against her will, by the standards of society. The lines that read, "I, being born a woman and distressed/By all the needs and notions of my kind," may mirror not only the expectations of her society, but the "needs and notions" reinforced by other members of her sex. She feels driven, despite her own feelings, to care about love in the same way that other women do. Other women feel a sense of security whereas the rational poet finds her lover too close for comfort, "I..., am urged by your propinquity to find your person fair, and feel a certain zest/To bear your body's weight upon my breast..." an image obviously sexual, revealing a metaphorical oneness in love and sex. The image expresses the closeness or "propinquity" the woman feels as the man is bearing down upon her, possibly too heavily. As he closes in on the woman with feelings of love, he does the same in the sexual sense. This experience may involve feelings of inferiority on the woman's part. As she writes, "bearing your body's weight upon my breast," she alludes to the common practice of sexual intercourse where the man is above the woman, an image that may represent a hierarchy in control of her.

The woman either speaks for a particular experience or from reflecting on a past incident in which she felt "undone, possessed," following a sexual experience. According to Patricia A. Klemans, the author most likely reflects upon past experience. Klemans conjectures that the poet of "I, Being Born a Woman" was not only a woman of perception, as all poets must be, but also of experience. She had, by the age of thirty-one, led a life of personal and sexual freedom generally reserved for the men in her society. Her poetry presents a new viewpoint to literature - the liberated woman's view (201). The portrait of the woman is one of tousled hair, no makeup, clothes on the floor, a look of wonderment at what she has just done and why, but the persona shatters the controlled feminine image of herself as she meticulously displays reasons why she is a woman "distressed." The distress comes not from following the "needs and notions" of her kind, but from not wanting to follow them. A social and biological plan is already assumed for her - one that she resents, "So subtly is the fume of life designed/To clarify the pulse and cloud the mind." The "fume" is continually fed by a society that supports it in a way that no one can see its process or its effects. This design of society's is supposed to sustain the momentum or "pulse" of life. But instead Millay writes, "Think not for this, however, the poor treason of my stout blood against my staggering brain..." She fights inner conflicts between biology and reason. Reason tells her that she is unsure of her love for the man, while biology accounts for her irrational lust for him. As lust overrides her more rational sense of uncertainty, she seems to speak to him as she writes these lines, expressing the guilt of her false devotion.

Millay examines her own perception of love - not society's. Klemans determines that the terse conclusion, "I find this frenzy insufficient reason/For conversation when we meet again," characterizes a woman who refuses to conform to society's dictates (201). A confused love for a man has caused the persona of the poem to delve into a state of "frenzy" or panic, one that might not exist without the man's presence. The use of the word "conversation" in the context could express her desire to communicate in a different manner, one where she would be rational, not frustrated, indecisive between thoughts of love and lust.

According to Klemans, Millay's skill and message of feminine individuality is timeless. Her poetry, which may have been pushed to the back shelf many times, will appeal to the men and women of today. Millay belonged to that generation of women who gained the right to vote and who looked up to Amelia Earheart for crossing the Atlantic Ocean in a plane (211). As she integrates herself into the thoughts and feelings of lovers, she concentrates on something so universal and timeless - sexual love. In most cultures, it is a feeling held superior to all others.

In a world of couples, the individual perception becomes clouded. No one really wants to hear about it because it really should not exist, never mind that "the fume of life designed," referred to by Millay may be inefficient. While separating ourselves into couples, instead of individuals, brings much joy and happiness to many, it may bring tragedy to others. In a world where the individual is valued, women may find courage to leave husbands who abuse them and girls may not feel that they have to have sex with their boyfriends just to hang on to a partnership. Millay's perception is not "angry feminist," nor it is a threat to traditional family values, but it is a force that strengthens these high priorities.

Love is wonderful, but often the pressure to find or sustain that love overshadows the happiness it is supposed to bring. Lack of love causes much of the trouble in the world. Not only must it exist between two people, but it must exist within communities of people in order to be truly effective. Community is the core area in which love has failed. As couples, people sometimes forget that they are two unique individuals. Millay, despite circumstances, has managed to overcome the pressure she faces from her society, one that refuses to accept her uncoupled. She has rejected a love she finds senseless, one that jeopardizes her happiness. In her refusal To accept society's plan, she finds independence ant the strength to be a woman, and most importantly - an individual:

I, being born a woman and distressed
By all the needs and notions of my kind,
Am urged by your propinquity to find

Your person fair, and feel a certain zest
To bear your body's weight upon my breast:
So subtly is the fume of life designed,
To clarify the pulse and cloud the mind,
And Leave me once again undone, possessed.
Think not for this, however, the poor treason
Of my stout blood against my staggering brain,
I shall remember you with love, or season
My scorn with pity, - let me make it plain:
I find this frenzy insufficient for conversation when we meet again

The Romantic Paganism of Niccolò Ugo Foscolo: Infancy, Greece, Venus, Exile, Pain, and Death in the Foscolian Artistic Sensibility

Mark Anthony Espinosa

Department of Italian
84 College Avenue
Rutgers University

Faculty Advisor
Dr. Andrea Baldi

That Foscolo's paganism was a motivating force in his artistic philosophy has long been recognized, but his veneration for childhood, ancient Greece, exile, and death have rarely been ascribed to it, although careful study of his works, especially his sonnets and early poems, reveals this crucial connection. Foscolo derives from conventional paganism that life is but exile from fame and that death is a new childhood awaiting the exiled man.

PURPOSE

Foscolo's philosophy is consistently expressed throughout all of his works, yet confusion has persisted with regard to its specific tenets. The famous critic Giuseppe Cittana wrote, in fact, "Foscolo, as we shall see, was not a true love poet. The sentiment of love never found in him an adequate poetic expression." Yet in a letter in which he dedicated the poem *To Beauty* to his friend Costantino Naranzi, Foscolo asserts, "Love, that divinity most beneficial to man, that animates our existence and fills us with the images of our will and hope, love delegated these verses to me, which I offer to you my sensible friend, the dearest companion of my persecuted and afflicted days." Here Foscolo establishes the position of love as one of his most important artistic deities, placing criticisms such as those of Citanna in a dubious light. Clearly this illustrates the need for a more comprehensive analysis of the poet's philosophy than has been undertaken thus far. Yet hardly does there exist a significantly large enough number of variations from his central philosophy thoughout his works to warrent this confusion. Foscolo consistently proves how crucial his philosophy was for him and his art.

His more famous works, such as The Final Letters of Jacopo Ortis and The Sepulchers contain all of the elements of Romanticism and paganism which were tenets of his artistic ideology. While these masterpieces clearly deserve even more study than they have recieved, many observers have erroneously overlooked the importance of entire sections of his early poetry because of normative and stylistic reasons. Citanna is among that group, having written, "If Foscolo was, as Carducci observes, "a precocious master of verse," he didn't show in the poems of his adolescence true poetic qualities. His first verses, the hymns and elegies, are yet the nursery rhymes of a child who has been exposed to a little classical culture and lives in the time of the Arcadians." He goes on to say of Foscolo's early verses that they are "nothing more than rhyming words, intonated in a tedious and archaic fashion." Yet even if Citanna's criticisms were true, they would still not lessen the importance of Foscolo's early poetry in any meaningful analysis of his poetic philosophy. Such normative analysis only obscures that fact that, regardless of anyone's opinion of a particular work, it's importance alone warrents study and analysis. Furthermore, Foscolo's veneration of his youth magnifies the importance of his early poems tenfold, so to exclude them from any study would be a perilous route for the researcher to take.

Not only are they beautiful, but his poetic works, especially his early sonnets, provide an especially useful vantage point for analysis because of their concise and intricate structure. Thus, the purpose of this study is to illustrate the connection between those works and Foscolo's artistic philosophy.

INTRODUCTION

At the root of Foscolo's philosophy is a veneration of infancy and youth, including Romantic and paganistic elements. Infancy is seen as the time when man is closest to innocence, purity, beauty, and the fertility of nature. The Romantic substructure of such a veneration is clearly evidenced when Foscolo is juxtaposed against contemporaries such as Wordsworth, whose *To Laura* is a testament to his veneration of childhood.

Converse to this view of childhood as a moment of peace and eqilibrium is Foscolo's view of the life of mortal man. Life is clearly the antithesis of infancy for the poet, comprised of hardship, pain, and affliction. In his letter to Naranzi, Foscolo clearly expresses this feeling of affliction and exile. This accompanies his view of the world as a place incapable of appreciating greatness until it is gone. From this view, and the hard exiled life which prompted it, comes his veneration of death as a means of achieving the fame of which he felt deserving and escaping from the life that is the antithesis of the beauty of childhood. Foscolo's Romantic ideology also puts him at odds with the methodical dogmas of the Enlightenment, and he affirms passion above reason as the guiding force of his actions. Included also in his philosophy is the affirmation of the individual. All of these elements comprise the Romanticism which Foscolo shares with poets such as Leopardi, Keats, Wordsworth, and Shelley.

In addition to Romanticism, Foscolo incorporated his paganism into his poetic philosophy. His romantic veneration of childhood espoused his paganistic veneration of ancient Greece, which he saw as the infancy of civilization. Foscolo saw civilization as necessary for art to thrive, especially the poetic art that he saw as the idealogical apex of human development. Since ancient Greece was the first civilization, it was, to the poet, the most sacred, and since Homer was its greatest poet, Foscolo took him as his artistic idol. Included in this philosophical reference frame is a veneration of Venus as love's most beautiful protector.

The result of this conglomeration of ideas and artistic values is a consistent veneration of infancy, Greece, Venus and Death in all of his poetry. But, this veneration is equally accompanied by an acceptance of the pain and exile that comprised his mortal life. The only hope that Foscolo held within his heart was that with death his greatness would be vindicated by the fame that would thereafter prove his greatness and the world's foolishness.

THE SONNETS

While Foscolo's philosophy is distinct because of the elements of paganism which it espouses, nevertheless he was also a romantic. All of the major elements of Romanticism are evidenced in his poetry, but they are most succinctly expressed in his famous sonnet, the *Self-Portrait*. In the first eight verses, Foscolo gives a physical and psychological description of himself unprecedented in Italian literature except for one letter written by Petrarch. Even this description, however, conveys the romantic philosophy. His lips are "slow to laugh," he writes, illustrating the somber reality that romantics experienced as a reaction to the trials of life. These trials and the poets reaction to them are eloquently surmised by the verse, "{I am} hostile to the world, events are hostile to me." The melancholic, solitary, and pensive components of the romantic composure are clearly expressed in the ninth verse, "Melancholy most days, and alone; thoughtful always. . . ." Anger, also an important poetic sentiment of such idols of Foscolo as Dante, makes the poet "brave," and although the logic of the Enlightenment cautions him, Romantic passion "raves" within and is his ultimate guide. In the end, death alone gives him "fame and rest," symbolizing not only the peace which for pagans is the closest approximation to divinity but also the glory which is the pagan substitute for the immortality of the Christian paradise. Thus, along with some paganistic sentiments we find here a clear expression of Romantic philosophy.

"Never again shall I touch the sacred shores; where my infant body lay; my Zante. . . .," begins the famous sonnet *To Zante*, illustrating not only the close connection Foscolo felt to his infancy and the Greek island which fostered it but also the sense of hopelessness brought on by his inability to ever regain the youth and the home that he lost. While his youth was lost as a consequence of time's passing, his home was lost as a consequence of his exile. He implies that Zante's shores are also sanctified by the ocean which surrounds it and from which Venus was born, who represents all beauty, fecundity, and purity. In turn, her fecundity sparked the growth of and sanctified ancient Greece. The civilization of ancient Greece produced Homer, who in turn venerated Ulysses and made his painful exile praiseworthy. In the end, the mother earth who herself is a deity for pagans shares the mortal fate of the poet, for to both of them is "preordained by fate an unwept sepulcher." The poem begins with the veneration of birth, and ends with an equally forceful veneration of death. Ultimately, it is death, or more specifically the poet's mortality, which prevents him from returning to Zante and his infancy. Thus all of the Foscolian elements are present, and the sanctity of youth and Zante begins a chain of

veneration, making of his philosophy a logical acceptance of the reality of beauty.

Death is further venerated in the sonnet *To Evening*, where Foscolo compares night to that "fatal quiet" that was the peace that his life so much lacked, and which so "gently" followed the "secret paths of {his} heart." Only with the hope for death, symbolized by the evening, does the "evil time go, and with it go the swarms of cares, where, with me, both of us it destroys." His Romantic "warrior's spirit" raves, but his hopes of paganistic immortality in the form of death allows that spirit repose.

Conversely, love replaces Death as the object of hope in the sonnet *To His Distant Love*. "Love, amid the infernal shadows, will follow me, immortal, omnipotent," he concludes, thus allowing him comfort from his "long exile among accursed peoples." His exile is further reiterated in *Upon the Death of His Brother John*, in which he laments over "always fleeing from people to people" and the inability to even approach his native land without sensing "the hostile Gods and the secret cares which to your life were a tempest." Of his youthful hope, the only hope remaining is that the foreigners among which he is exiled will "return {his} bones then to the bosom of {his} mourning mother."

Thus, although we have seen the elements of infancy, Greece, Venus, exile, pain and death consistently throughout his sonnets, some historical analysis is useful in putting this philosophy into perspective.

ANALYSIS

Niccolò Ugo Foscolo, commonly known as Ugo Foscolo, was born on the island Zante, then a Venetian possession but originally one of Greece's Ionic islands, February 16, 1778. His father was of an ancient Venetian lineage and his mother was Greek. The exposure to those two cultures coupled with his childhood on an island rich in history and nostalgia for Greek antiquity, producing a strong hold on the Foscolian imagination. Mario Pazzaglia says of the figure of Zante in Foscolo's imagination, "In that he saw the symbol of beauty and harmony which the great poetry of antiquity had expressed and which he continually sought as the supreme ideal of his life."

Foscolo's painful and tumultuous life further caused him to fantasize about his childhood, and what began as an admiration of youth developed into an obsession that ignited his idealization of the Greek antiquity that he associated with it and furthered his desire to somehow regain his "Greek youth." Clearly, he inherited his artistic sensibility from the Greek Homeric poetic tradition which he so eagerly sought. The morbid tinge on his works was further darkened by his mother's tragic life, who was the elder of two brothers and one sister, all three of which had committed suicide.

Foscolo expresses his paganism in an extremely pragmatic sense, venerating his most cherished pagan gods at every opportunity and making of the others the source of his difficulties in life. "I feel the hostile Gods, and the secret cares which were a tempest to your life, and I too pray for quietness in your haven," he wrote in the sonnet, *Upon the Death of His Brother John*, clearly illustrating that the Gods for Foscolo, unlike the Judeo-Christian God, can be as unjustly vindictive as equally as they can be venerable. Yet even though Foscolo felt some of the Gods were hostile to him, in Venus he saw a symbol of beauty and perfection that he personified into a virtual heroine. Venus was born a virgin out of the Ionian Sea that surrounds the Greece that the poet so much loved, and her famed beauty played on the strings of his romantic sensibility. But, even though Venus was a virgin, her beauty was not limited by abstinence in his imagination. Lacking the stigma placed on sexuality, Foscolo venerated her also for her fecundity, from which ancient Greek civilization had grown. Her birth was the birth of perfection, and even though she had the powers of a God, her youth went hand in hand with Foscolo's idealization of infancy to further increase the degree to which she was venerated. The ode To Venus is a beautiful expression of his veneration of Venus "above all other Gods."

Unfortunately for Foscolo, in the world of the living the hostile Gods seemed to have more power over his life than the venerated ones. The "Italy" of Foscolo's day was not a nation but rather a culturally linked group of city states, often ruled by the papal state or foreign potentates and too often at the mercy of foreign mercenaries with loyalties only to themselves. As an artist, Foscolo was quick to take a role in the tumultuous political life of the land he loved so much. The Lombardy in which he lived changed hands between the French, Austrians, and others several times. Eventually, Foscolo was exiled and after a short time in Switzerland made his way to England and spent what remained of his life there.

Foscolo did not simply accept his exile, but took his romantic pagan philosophy and made of his own life an icon. Homer venerated exile in his works as an obstacle that proved the worth of man when it was overcome, and the character of Ulysses in *The Odyssey* clearly obtained his greatness in that way. But Foscolo didn't have to search among the remnants of his literary cultural history to find a model of the exiled man, because he had in more recent Italian history a sufficiently venerable model: Dante Alighieri. Dante was exiled from his native Florence at a young age, but he wrote all of his masterpieces while in exile, and Foscolo expected the same of himself. Setting aside theology, in a purely artistic sense Foscolo took Dante as his modern model of the exiled man. He demonstrates this in poems such as his ode, *To Dante*.

Foscolo took the view of exile as an obstacle to greatness a step further and derived that he was great almost as a cause of his exile. In sonnets like *To Zante* and *Upon the Death of His Brother John*, Foscolo repeatedly expressed that the pain of exile was as much a part of his philosophy as the beauty of youth.

Exile's pain was a reality of his life, and in England he undertook "a tiring editorial work load which slowly but surely his health could no longer take" (Binni). The pains of day to day life were very real for him, and he writes of them just as frequently as of his artistic symbol of exile. Despite his taxing work load, Foscolo was never paid more than a pittance. Thus, not only was his health a source of constant worry, but he lacked the means by which to correct it, and his financial worries were quite often even more taxing. Darkness was certainly a reality of his life. After being in exile from Italy for 11 years, he died at the age of 49, still hounded by creditors, and living in one of London's poorest quarters. The pain of his life continually made Foscolo look further to his childhood and to Greece as the symbols of beauty and perfection that pervaded his art.

Interestingly enough, after death Foscolo's fame did increase tremendously, though still not to a level of which a writer such as he proved himself deserving. Nevertheless, even if he didn't achieve the fame which he deserved, at least he acquired the peace which he so much desired.

CONCLUSION

Foscolo's sonnets, though often overlooked, are among the most intricately composed expressions of artistic philosophy in world literature. Careful study of them affords tremendous insights into his other works. It also makes possible a comprehensive study of the semantics and structure of the sonnet, since Foscolo's genius is in being able to convey in poetry what it would take volumes to convey in prose. While the most perfunctory analysis affords insights, any legitimately comprehensive analysis would necessarily have to be undertaken in the original Italian. Nevertheless, regardless of the language in which they are studied, the sonnets provide an inlet to the highly complex philosophy of one of literature's most underappreciated artists.

In a very real sense, infancy is the ideal moment for man in Foscolo's philosophy, because it is the moment when, in his innocence, man is closest to the ideals of purity, innocence, and beauty which were so prized by romantics and which Venus so completely represented. Ancient Greece was seen as the infancy of civilization, and this myth is coupled with the image of Foscolo's own infancy in Zante, the beautiful Greek island to which he could never return. Foscolo was in his philosophy a romantic in the most all encompassing sense, and his insistence upon the individual evidences this. But along with the traditional elements of Romanticism, such as passion, sadness, solitude, thought, love and beauty, death and the fame which it brought were equally venerated due to his paganism. While in and of themselves pain and exile are never venerated, they are valued by Foscolo because they are essentially the obstacles which he felt all great men had to surmount. From this he derived that he was great as a result of his exile, not just because he overcame it. He saw himself as a great writer in the tradition of Dante and Ovid. In fact, the first project he undertook when exiled in London was to write a book on Dante. In addition, the ode written by him in his youth, *To Dante*, illustrates how greatly he idealized a poet whose theology was so much at odds with his own.

The consistent veneration of infancy and death create such a powerful cornice around the painful exile of life that life itself becomes but exile from fame and death is but a new childhood awaiting the exiled man. As children know nothing of life, men in Foscolian philosophy know nothing of death, and thus only by surmounting this ultimate obstacle may their innocence and purity be renewed.

Subject Pronoun Usage in Mexican Spanish in South Texas

Dr. Sandra Baumel-Schreffler

In the United States prolonged contact between Spanish and English has led to the creation of a large group of bilinguals whose capabilities in each language vary. One of the most obvious differences between these two languages is the requirement of English that every sentence have an overt subject. Unlike English, Spanish speakers have the option to eliminate overt subjects. This absence of overt subjects is coupled with other linguistic characteristics into what has come to be termed the "Pro-drop Parameter."

(1) (a) *We* went to the store.
(b) Ø fuimos a la tienda.
Nosotros fuimos a la tienda.

The presence of unnecessary overt subject pronouns in Spanish creates a "heaviness" which native speakers often feel upon hearing an abundance of subject pronouns which is attributable to their special contrastive function.

(2) (a) *They* think that they can do whatever *they* want (to).
(b) *Ellas* piensan que *ellas* pueden hacer lo que *ellas* quieren.
(c) *They* think that Ø can do whatever Ø want (to).
(d) *Ellas* piensan que Ø pueden hacer lo que Ø quieren.

Their usage or lack thereof is not merely a stylistic difference amongst speakers, but rather may correspond to differences in syntactic structure (Cf. Lipski 1991). An increased usage of overt pronouns has already been observed in the Mexican and Mexican-American populations of Los Angeles by Silva-Corvalán and Gutiérrez. The Spanish-English bilinguals of South Texas provide a similar population which has not been studied previously although it is one of the largest in the United States. Furthermore, it will furnish empirical data for future comparative studies.

The central hypothesis of our study is that there is a positive correlation between a decreasing ability in a bilingual's oral Spanish and an increasing number of obligatory subject pronouns in his Spanish which we can attribute to a superior ability in English. As the speaker's ability in Spanish diminishes, the use of certain structures such as obligatory overt subjects in environments where they are absent from the speech of monolingual Mexican Spanish speakers increases. Although pro-drop in Spanish is optional, except in the case of obligatory null subjects, insecurity in Spanish allows the English patterns to serve as defaults for these bilinguals.

The main focus of our study is to determine whether second and third-generation Mexican-American bilingual speakers in South Texas are employing overt subject pronouns more often in syntactic environments where they were previously either missing or optional. By second-generation bilinguals we mean Spanish-dominant bilinguals who are persons who are more comfortable speaking and have a better grammatical grasp of Spanish. We define third-generation bilinguals as those participants whose primary language is English and who express themselves more easily in English than in Spanish. Our

210

population sample consists of a group of thirty individuals chosen at random from the area in the immediate vicinity of the city of Kingsville in South Texas. We carried out the study by means of a written questionnaire which asked monolingual Spanish-speakers to make grammatical judgments on a series of thirty Spanish sentences in order to establish the basis for comparison with both Spanish-dominant and English-dominant bilinguals, who were asked to provide acceptability judgments on the same thirty Spanish sentences and on an additional sixteen English sentences which contained or lacked the same traits present in the Spanish examples. Let's examine a few of the sentences:

(3) (a) *Yo* creo que *yo* soy muy inteligente.
I believe that *I* am very intelligent.
Yo creo que Ø soy muy inteligente.
I believe that Ø am very intelligent.
Ø creo que Ø soy muy inteligente.
*Ø creo que *yo* soy muy inteligente.
(b) En el canal 3 Ø dicen que Ø va a llover.
On channel 3 *(they)* say *(it)* is going to rain.
(c) Ø Les digo a mis hijos que Ø se porten bien.
I tell my children to behave themselves.
Ø Les digo a mis hijos que *ellos* se porten bien.
I tell my children that *they* should behave.
(d) En la biblioteca Ø hay unos libros de poesía interesantes.
In the library *there are* some interesting poetry books.
*Ø Lo hay unas películas buenas en la televisión esta noche.
There are some good movies on TV tonight.

Among the types of obligatory null subjects in Spanish can be found the expletive subjects of weather and existential sentences:

(4) (a) Ø Llueve mucho en la primavera.
It rains a lot in the spring.
(b) Ø Hay muchas personas aquí.
There are many people here.

Arbitrary or indefinite subjects are exemplified by sentences such as:

(5) (a) Ø Dicen que va a llover.
They say that *it* is going to rain.
(b) Ø Lo anunciaron en un programa de televisión.
They announced it on a television program.

And finally we have sentences referring to non-human subjects as found in the answer to the following question:

(6) (a) ¿Dónde están mis zapatos?
Where are my shoes?
Ø Están en tu cuarto.
They are in your room.

We must keep in mind that overt subject pronouns must only refer to persons or personified subjects. There are also situations where the pronouns replacing human subjects must be null, as in some subjunctive structures and quantified sentences.

(7) (a) Les digo a mis hijos$_i$ que Ø$_i$ se porten bien.
I tell my children$_i$ that (they)$_i$ behave.
(b) Les digo a mis hijos$_i$ que ellos$_j$ se porten bien.

I tell my children$_i$ that they$_j$ behave well.

(7) is an example where the presence of a pronoun in the subordinate clause indicates disjoint reference rather than referring to the indirect object of the independent clause. Disjoint reference means that the subject of the subordinate clause is a person other than the ones referred to in the main clause.

We conducted and tape-recorded an interview with each participant to determine the characteristics present in his conversational Spanish. The sessions took place at a location chosen by the respondent so that he would be the most comfortable. Each interview lasted between twenty and thirty minutes during which time the individual spoke on the topic or topics of his choice.

The results of test utterances as well as our analysis of unmonitored speech reveals great variation in the actual production of these forms. As shown by our study samples, we observed that none of the speakers interviewed completely failed to use null subject pronouns nor employed overt ones exclusively. The data indicate that some of these Spanish speakers are approaching a stage where the only distinguishing feature between null and overt pronouns is the presence or absence of phonetic substance.

The data appear to support a modified version of our hypothesis, that is: Any level of proficiency in and prolonged contact with English by bilingual Spanish-speakers, increases the incidence of redundant overt subject pronouns in syntactic contexts where they do not appear in the speech of monolingual Spanish-speakers. Support for our revised hypothesis is provided by our qualitative analysis of both the sentences contained in the questionnaire and the speech samples contributed by the recorded interviews.

As we progress towards the determination of definitive results, we must keep in mind that certain characteristics of Spanish which have come to be considered categorical by prescriptive grammarians are not categorical at all as evidenced by the lack of agreement among the monolingual participants in our study as well as by the Spanish-dominant bilinguals who took part in both Lipski's (1991) and Baumel-Schreffler's (1995) investigations. We cannot lose sight of the fact that communication is the primary function of language. In addition, we cannot ignore the place which grammar occupies in the communicative process, for if the grammar is ignored, the speaker cannot effectively deliver the message nor the listener decode it. Furthermore, we must dispel the notion held by many Spanish-speakers that their speech is simply "bad" or "incorrect" Spanish. The fact is that they are in the process of developing a new Spanish dialect native to the Southwest region of the United States.

I, Tituba, Symbol Of The Antilles

Debbie Officer

Faculty Advisor:
Dr. Margarite Fernandez-Olmos

To the naked eye the Caribbean looks like the picture perfect model of cultural synretism, but how did this cornucopia of peoples come about to create such distinct cultures? What makes the Caribbean so unique a place? Language and exile are themes I will be examining as cross currents throughout the archipelago -Francophone, Anglo, Spanish, Portuguese -in order to examine that question. Many scholars have used Shakespeare's Caliban as a symbol, a yardstick by which to look at colonization and its effects on culture, language and psyche. I propose alternative symbols in the use of language and exile as subthemes in order to arrive at a deeper understanding of linguistic exile. I posit the thesis that the literary and historical character, Tituba of Maryse Conde's I, Tituba, Black Witch of Salem given her syncretic characteristics and the novel's Caribbean origins, is a more authentic and viable symbol of the island's complexities than the oft-used Caliban.

The Antilles is the picture perfect model of cultural syncretism. The literary and historical character Tituba of Maryse Conde's I, Tituba, Black Witch of Salem, given her syncretic characteristics and the novel's Caribbean origins, is a more authentic and viable symbol of the island's complexities than Shakespeare's oft-used character in The Tempest, Caliban. Alternative symbols when looking at language and exile as sub-themes are necessary in order to arrive at a deeper understanding of colonization and linguistic exile within the the region. Tituba's Yoruba or Santeria practices inspires the Salem witch trials, she is Helen in Derek Walcott's Omeros, the grandmother figure (conquistador) in Gabriel Garcia Marquez's short story "The Incredible Sad Tale of Innocent Erenderia and Her Heartless Grandmother," who becomes her granddaughter's hustler because the young woman accidentally burned down their home. Erenderia was in debt to her grandmother. Tituba is characterized as Jamaica's national revolutionary heroine Sister Nanny, and the recent Haitian boat women who fought for democracy and justice on that troubled island until they were forced into exile. Tituba, who also wears the guise of the Santeria, Candomble, and Yoruba goddess Yemaya, represents this cornucopia of people who have come to create one of the most unique places on earth -the Antilles. Tituba practices a syncretic religion, and speaks the language of the Anglo-Caribbean in the novel.

In a post-colonial cultural context, Tituba, symbol of the Antilles is the voice of the oppressed slave population in Conde's creation. It can be assumed that Tituba in life must have been quite a woman, after all, didn't she create an historical event which now has its own chapter in history books -the Salem witch trials? She is not referred to as a symbol of women's oppression when one might read or hear about the Salem trials, therefore Conde's powerful and testimonial version of Tituba, woman of the Antilles. Tituba knew that her life would have been ignored by histortical writers. She tells us before all this happens that:

> I had already regretted having played only a minor role in the whole affair and having had a fate that no one could remember. "Tituba, a slave originating from the West Indies and probably practicing 'hoodoo'" A few lines in the many volumes written on the Salem witch trials. Why was I going to be ignored? This question too had crossed my mind. Is it because nobody cares about a Negress and her trials and tribulations? Is that why? I can look for my story among those of the witches of salem, but it isn't there (149).

Like modern day Caribbeans, Tituba lived in exile, away from her native Barbados, but practices and pulls from her diverse cultural background of African, Indian and European ancestry when she was sold and then taken to Boston by a Puritan family.

> How strange it is, this love of our own country. We carry it in us like our blood and vital organs. We only need to be separated from our native land to feel a pain that never loses its grip welling up inside us. I could see Darnell Davis's plantation, the arrogant Great House with its columns at the top of the hill, the black shack alleys seething with suffering and life, children with bloated stomachs, women wizened before their time, crippled men, and those cheerless surroundings I had lost suddenly meant so much that tears streamed down my cheeks (48).

The issue of Tituba's race could be debated for centuries, but African, Arawak or Carib Tituba represents the voice of the people who today make up the Antilles. She is a proud, strong, vocal warrior for a social cause -slavery. Tituba is cinnamon colored Gabriela in the Brazilian writer, Jorge Amado's Gabriela, Clove and Cinnamon. Tituba is a sensuous woman who embraces her sexuality. She lives despite her and her people's condition, and she loves freely. Tituba tells us, "I have loved men too much and shall continue to do so. Sometimes I get the urge to slip into someone's bed to satisfy a bit of leftover desire and my fleeting lover is delighted with his solitary pleasure (178)." In Walcott's version of Tituba in Omeros, Helen is "sprawled on the unmade bed/ brown/ and naked as God made her. The hand was not hers/ that crawled like a crab, lower and lower down/ into the cave of her thighs, it was not Hector's/ but Achille's hand yesterday. She turns slowly round/ on her stomach and comes as soon as he enters (153)." In I, Tituba, Tituba herself embraces love and sexuality within the complex world of slave society where love and lovemaking are hard to find.

Shakespeare does not give us a description of Caliban's world as one that is surrounded by mangoes, guava, tamarind, unending rivers, silk-cotton trees, and Santeria sacrifices. Tituba's world is seeped in what is today the syncretic cultural core of the Greater and Lesser Antilles from the "Yucatan and Florida peninsulas southeast to Venezuela, with the Greater Antilles (Cuba, Hispaniola, Puerto Rico, Jamaica) in the north and the smaller islands, or Lesser Antilles, generally to the southeast (Richardson 1995: 6). Tituba is a strong figure where Caliban conjures a more humble, elf-like image; Tituba tells us her own story, her image is bold and powerful. Anne Armstrong Scarboro says that "The emphasis on Tituba's religious/spiritual powers in the narrative enhances Tituba's status as a folk heroine and makes the useful point that there are different ways of interpreting the world (218)." It is through Tituba's eyes that we get an intimate glimpse of the slave's environment, pyshche, religion, torture, pain, and daily yearning for freedom.

The name Caliban is an "anagram of cannibal," followed by Carib-cannibal, Caribbean. Tituba is no one's "savage." In his book Lost Tribes and Promised Lands, Ronald Sanders adds that

> the underside of the colonial experience is above all represented in The Tempest by Caliban (the name is an anagram of "cannibal"), who is Shakespeare's summary vision of the colonized savage, and the last of the eminent racial outsiders in his plays. Shakespeare's sentiments went out to men and women of the Old World, and not to the exotic beings -whether fancifully or realistically conceived -who inhabited faraway places. Indeed, his view on the colonization of such places seems to be that one should, in the end, do precisely what Prospero does and get out of them, leaving behind for good all the problematical even if profitable relationships that they entail. The poet shows no fondness for Caliban, and no faith whatever in the spiritual capacities of this savage who latches on to a pair of drunkards in his clumsy strivings for freedom (254).

Tituba says her name was given to her by her African step-father, Yao He "was as tall as a silk-cotton tree" when he committed suicide after her mother was hanged She lived under force here in the United States longing for the beauty and sunshine of her Barbados She explains how she imagined her island home

> "I filled a bowl with water, which I placed in the kitchen and imagine my Barbados The bowl of water managed to encompass the entire island, with the swell of the sea merging into the waves of the sugarcane fields, the leaning coconut palms on the seashore, and the almond trees loaded with red and dark green fruit Although I had trouble making out the inhabitants, I could see the hills clearly, the cabins, the sugar mills, and the ox carts whipped on by invisible hands And all that moved silently at the bottom of my bowl of water (62)

One day after she had returned from America, fresh out of a Boston prison where she was being accused of being a "witch," the slaves brought a young boy who just received "250 whiplashes on his legs, buttocks, and back, and his body weakened by a spell in prison had collapsed (159)," to her for care She informs us that "the slaves were carrying him to an unmarked grave in a field of Guinea grass when they noticed he was still alive " Tituba was a healer, a mender of wounds -a wise woman She was the healer of the bruised and bleeding souls around her on many Barbados plantations

Jamaica's national motto, "Out of many, one people" embody Tituba, not only because she is of mixed race and is a practitioner of a religion which resembles Santeria, Obeah, and Candomble, but because she exudes the very essence of what is Caribbean She is a product of the violence of the slave trade, and she tells us of her conception

> Abena, my mother, was raped by an English sailor on the deck of *Christ the King* one day in the year 16** while the ship was sailing for Barbados I was born from this act of aggression From this act of hatred and contempt (3)

On the other side of the Caribbean, along the Colombian coast, Marquez conjures up Tituba's spirit in the character of Sierva Maria, in his novel. Of Love and Other Demons The half mestiza and Spaniard practices Yoruba with the slaves and speaks their many languages Sierva Maria "sang in Yoruban, Congolese, and Mandingo A short while later two black slave women came by, recognized the Santeria necklaces, and spoke to her in Yoruban The girl's reply was in the same language (64) " The novel's syncretic elements are at the root of the narrative, and ultimately the elements that make up the Antilles The novel speaks to the heart of what is Caribbean Indian royal palm, Bedouin djellabas, Spaniards, English, Portuguese Jews, Abyssinians, a chair from China, Africans, Yoruba, Catholicism, and Islam

Sierva Maria is Tituba in an abundance of guises According to Marquez "She could dance with more grace and fire than the Africans, sing in voices different from her own in the various languages of Africa, agitate the birds and animals when she imitated their voices the younger slave girls would blacken her face with soot They hung Santeria necklaces over her baptism scapular (12) " Tituba travels the Antilles, where she passes on her wise woman traits to so many others, Antillean women writers are products of this grandmother wisdom of Tituba

In her book Postcolonial Representations Women, Literature, Identity, Francoise Lionnet looks at several novels written by women from the Antilles and North Africa Tituba is in all of them She says that

> Women writers living and writing in Africa and in the new worlds of the United States, the Caribbean, and the Indian Ocean, as well as those who emigrate to various European countries for personal, educational, professional, or economic reasons, have given us unique insights into what Renato Rosaldo has called 'border zones' of culture (6)

These women writers "all share one important characteristic they belong to an increasing number of astute interpreters of the postcolonial condition whose works, published in the

1970s and 1980s, have been redefining traditional conceptions of history and culture, literature and identity. They create new paradigms that represent, through innovative and self-reflexive literary techniques, both linguistic and geographic exile, displacements from the margins to a metropolitan center, and intercultural exchanges (7)."

Tituba, it can be argued, thanks to Conde's "dreams" has become the black, brown, and yellow woman's Caliban. It is through the character of Caliban that male scholars have been able to analyze the impact of colonialism and European hegemony, using such themes as language, culture, and exile. Tituba now stands as a testimony to the plight of women and their resilience under slavery, religious oppression, colonialism, and male dominance. Tituba, our new symbol of the Antilles lives today somewhere in the reality of what has become Antillean postcolonial and neocolonial culture.

A Profound Cultural Exchange
The Mexican Muralist Movement and the
Harlem Renaissance and its Modernist Descendants

ABSTRACT

In examining the Mexican Muralist Movement and the Harlem Renaissance of the 1920s and 1930s, one cannot deny the dramatic cultural exchange flowing between these two movements. The Mexican muralists and the Harlem Renaissance artists depict the people's victory over the repression and inequities of their time, while radiating pride in being Mexican and African-American. The works of African-American artists, such as Langston Hughes, manifest a strong identification with the black working class; the powerful paintings of Diego Rivera, also, portray the oppression of the indigenous Mexican peasants. Emerging from the thrilling Harlem Renaissance movement, the African-American Modernist artists of the 1940s and 1950s captured the techniques and messages pursued by the Mexican artists to arouse pride in their African heritage and express the concerns about the status of African-Americans in the United States. The movements reflect a deep artistic connection between Mexico and the United States.

The Mexican Muralist Movement was a direct result of the Mexican Revolution of 1910-1917. Maria del Carmen Ramirez states, "...the Mexican mural painting movement became a paradigm of the cultural regeneration of Mexico brought about by the Revolution" (Ramirez 104). Artists emerged as the intellectual leaders of the post revolutionary period in Mexico and the murals were a new way of expressing Mexican culture. The murals reflected cultural pride, but raised social awareness at the same time. The muralists aided in the creation of a national art that expressed their social realities. The murals served as an instrument of social justice on the part of the campesinos (Mexican peasants) because they reflected the campesinos' burden: a laborious lifestyle, little pay, no land, and exploitation by the Mexican government. One of the most famous Mexican muralists, Diego Rivera, was known for depicting the difficult social conditions the peasants endured. In his powerful painting, *The Flower Vendor* (1935), the peasant's emotional and social burden is allegorically reflected by the huge basket that he is carrying on his back. The peasants were forced to carry the brunt of Mexican society. Rivera has ingeniously manipulated the dimensions of the figures in this painting by making the peasant smaller in size and exaggerating the magnitude of the basket, to where it jumps out at the audience, as to make a bold statement regarding that period.

The exploitation of the peasants is, also, depicted in Rivera's mural, *Repression*. A rebellion in the background between the militia and the peasants is brought to the foreground by the soldier attacking a campesino with his sword. Standing between the soldier and the campesino, a peasant woman with her child in her arms, is fiercely grabbing the arm of the soldier. The crying baby serves as a witness to this atrocity. In David Alfaro Siqueiros' mural, *From Porfirismo to the Revolution*, the campesinos are literally depicted as the masses- their personal identity is lost. The campesinos are dressed in white military uniforms with yellow sombreros and the first three men are distinguished as the leaders of this rebellion. The faces of these men become lost with each increasing row. However, their identical physical appearance is symbolic of their common goal, which is to unite and demand their rights from the Mexican government. Rivera's and Siqueiros' murals celebrated "the peasant leader who becomes the seed of a

nation" (Monsivais 74). The muralist movement challenged those in power and at the same time, affirmed the values inborn to Mexico's history.

Even as early as 1923-1929, photographers, Tina Modotti and later, Lola Alvarez Bravo captured the daily lives of the dispossessed of Mexico in an attempt to present the reality of their social conditions at that time. However, although, the Mexican Muralist Movement was a reflection of the social conditions plaguing Mexico before and after the Revolution, the muralists also became "agents for forging a new national identity" (Ramirez 104). The paradox of this "new" national identity, however, is that it manifested itself in two contradictory manners- through a new political ideology, *yet* a retreat to Mexico's past. In reference to the "new" Mexico, the new revolutionary state reflected a fresh political ideology and the muralists were responsible for linking their art to the political development of the state. Hans Haufe refers to this new man as the Mexican Prometheus: "In this hymn to the birth of a new man, the Mexican Prometheus, the hopes of the Revolution were realized in an earthly paradise" (Haufe 94). But, at the same time, historical themes soon became a main preoccupation for the muralists and a new appreciation and understanding rose for their Aztec roots. Rivera believed he could link Mexico's present state to his indigenous past. On the walls of the Cortes Palace, Rivera painted the *Conquista* (1929-1930), in which the Spaniards are depicted as the destroyers of pre-Hispanic world peace. It is clear that Rivera sympathized with his Aztec ancestors and glorified their achievements. According to Haufe, "Rivera's identification with Mexican culture and history was chiefly aimed at strengthening the national consciousness" (Haufe 94-95).

Frida Kahlo, who was married to Diego Rivera, is perhaps, the most powerful Mexican female artist. Kahlo was greatly influenced by Mexican folk culture and her Aztec roots. She incorporated rich colors and expressive combinations of folk art in her paintings. Kahlo was proud of her Mexican roots and even though her father was German, she identified entirely with her Mexican heritage. In her self-portraits, Kahlo's Mexican appearance is emphasized through her bronze Indian complexion and her hair, which she wore in the style common to the Mexican women of Tehuana. Maria Izquierdo, another female artist during Kahlo's time also reflected her Indian roots and appearance in her paintings by using bright colors. Izquierdo incorporates her Indian ancestry with Spanish culture, as we see in her painting, *Good Friday Altar*. Both artists, together with Tina Modotti and others, formed an indisputable force that energized the Muralist movement.

Diego Rivera, as did other muralists, painted on the National Palace, the National Preparatory School and the Secretariat of Public Education. These public buildings, which exhibited the murals, functioned as symbol of hope for the post-revolutionary state. But in 1935, Siqueiros criticized Rivera, saying that the muralist movement was reflecting the interests of the Mexican government more than the interests of the people. In a discussion that resulted, in which a nine-point accord was reached, one of the criticisms that was made about the mural art movement of 1921-1925 was that "Mexican mural painting...served the demagogic interests of the Mexican government more than the interests of the working class and campesinos"(Ramirez 108).

> Mexican painters began to proclaim the values of a new society. These artists embraced the pre-Hispanic past not only as a symbol but also as the aesthetic of indigenous culture...The Mexican muralists engaged themselves in the social, economic, and political conditions of the common man. They expressed and encouraged communal interaction toward the shared goals of fighting oppression and celebrating their cultural heritage (Amador, 1997).

By 1934, the Mexican mural painting movement had expanded beyond national borders and was making major contributions in the United States. From both sides of the border, governments promoted a remarkable exchange of artists, bringing into contact Rivera, Orozco, Siqueiros and Kahlo with Hale Woodruff, Elizabeth Catlett, Langston Hughes and Charles Alston- powerful artists of the Harlem Renaissance. The Harlem Renaissance artists of the 1920s and 1930s were among the first artists to celebrate Black history and culture. Before the Harlem Renaissance, Black Americans did not have the option of pursuing painting, writing and sculpture as professional careers. Most Blacks were discouraged from participating in American society, whatsoever, and were restrained by the Jim Crow laws in the South. Blacks were separated from whites in all aspects of public life. The Ku Klux Klan, race riots and lynching were a common reality among the black population in the United States at that time (some would argue that much has not changed even today). Out of this oppression, however, Black Americans found something to celebrate- their existence. Their African heritage, though quite fragmented, was a common element that united them and by the 1920s, a "New Negro" had evolved (Campbell, 1987).

The work of many African-American artists was paralleled in the art of their Mexican neighbors. The most important link between the Mexican muralists and the Harlem Renaissance artists was that they sought to establish a distinct cultural identity. Instead of being ashamed of their African roots and their history of slavery, the Harlem Renaissance artists radiated cultural pride throughout their works- in fact, the Black artists "focused on their ethnic disenfranchisement as topics for their artwork" (LeFalle-Collins and Goldman, 1996). In addition to emphasizing their cultural roots, black artists, also, depicted the social injustices plaguing the African-American community. Even Siqueiros dedicated one of his paintings to the discrimination that tormented African-Americans in the United States. In his painting titled, *Cain in the United States* (1947), Siqueiros depicts Cain as a black man. Cain is lying down on his back with chains, and naked white people, howling, around him are pulling his arms and his legs apart. Cain is portrayed as the lynched body of a black man whose head is bleeding to the ground- extremely symbolic.

There are four main factors that influenced these Black artists: the aesthetic theories of Alain Locke, the social realist movement in the United States, the rise of American socialism and communism, and of course, the work of the Mexican muralists, themselves. Alain Locke promoted the concept of the "New Negro" and he supported the establishment of a national cultural identity. He held the belief that African-American artists should reflect their African heritage and Southern expressions in their artwork. Social realists believed that it was impossible to separate art from its social and political context- this of course, is true of the Mexican muralists, as well as of Langston Hughes and the other Black artists. African-American artists sought to interpret how existing conditions affected the lives of Black Americans. Regarding the political arena of that time, many African-American artists supported socialist, communist, and nationalistic viewpoints that the social realists depicted (LeFalle-Collins and Goldman).

Perhaps the greatest Harlem Renaissance muralist is Hale Woodruff. Woodruff studied under Henry O. Tanner and Diego Rivera. Woodruff was awarded a grant from Columbia University and spent the summer of 1936 studying in Mexico with Rivera. His influence is quite evident in Woodruff's art. Woodruff's most famous murals are the *Amistad* murals (1939), which decorate Talladega College in Alabama. According to Zoe Ingalls, the *Amistad* murals "tell succeeding generations of students a story of enslavement and freedom and daily teach them the redemptive value of courage and hope" (Ingalls, 1996). *La Amistad* was a Spanish ship containing slaves headed for the New World. The first mural is called *The Mutiny Aboard the Amistad* and depicts the rebellion that took place in 1839 on the ship, the mural shows the slaves holding knives to the Spaniards necks' and there is chaos on the ship. The second mural, *The Amistad Slaves on Trial at New Haven, Connecticut* shows the slaves in the courtroom on trial in 1840. John Quincy Adams fought on the behalf of the slaves and won. The same men who had fought for the slaves' cause raised money for the slaves to return home to Africa. The third mural, *The Return to Africa*, shows the Africans returning to their native land in 1842, accompanied by two Christian missionaries.

The *Amistad* murals are a testament to the courage and strength the slaves displayed. Today, the murals continue to serve as a hope and encouragement to the many students entering the library of Talladega College. The murals, also, provide Black Americans with a piece of their own history. Rivera's murals, *Mexico Through the Centuries*, which decorates the National Palace in Mexico City, is similar to the *Amistad* murals in that they tell the history of the Mexican people. The mural, *Mexico Through the Centuries*, which took twenty-two years to complete (1929-1951), starts off with the Zapotec Civilization, one of the native tribes of the Mexican people. It shows the natives, cooking, making crafts, and laboring. The other two murals, tell of the arrival of the Spaniards in Veracruz and the political strife plaguing Mexico in the 20th century during the Revolution. The murals are painted with such detail and precision, so as to capture every moment. These murals represent that part of the Muralist Movement that sought to promote cultural pride and offer the Mexican people pieces of their own history.

Charles White has, also, offered African-Americans pieces of their history they can reflect upon. Charles White once remarked, "Paint is the only weapon [that] I have with which to fight what I resent. If I could write I would write about it. I f I could talk, I would talk about it. Since I paint, I must paint about it." White painted three historically influential murals from 1939-1943. One of these murals, *The Contribution of the Negro to Democracy in America* (1943) shows the contributions of African-Americans to American society. White borrowed many compositional structures from Rivera's "Mexico Through the Centuries," and the two murals bear striking stylistic similarities. White's two main themes in his mural are African -American resistance to white oppression and black contributions to the development of the United States. In the mural, on can see heroes including, Frederick Douglass, Nat Turner, Harriet Tubman. Also evident are Civil War soldiers, a chemist, a blues singer, and an anonymous mother and her child- all representative of the cultural, moral and scientific contributions African-Americans have made to American society. Hale Woodruff and Charles Alston collaborated in a mural, *The Negro in California History*, a project similar to that of White's (LeFalle-Collins and Goldman).

Along the same lines of reflecting history, Charles Alston painted a two-part mural reflecting an integration between African and American culture in the field of medicine. It reflects the history of African medicine in combination with the advances of modern medicine. The murals, *Magic and Medicine* (1936), were first exhibited in Harlem Hospital. The first mural, *Magic*, illustrates the origins of medicine in Africa. This is represented by African-American individuals standing in a cotton field and witnessing a baby being baptized. The suggestion of spiritual healing is further enhanced by a drummer playing over a sick woman who is dying, while African dancers perform dances below a large Fang statue from Gabon. Fang sculptures represented guardians of ancestral remains and here it is evident that Alston was influenced by Alain Locke's discussion of African art in The Negro in Art. The second mural titled, *Medicine*, Alston depicts men and women involved in contemporary medicine. A large microscope is seen in the central part of the painting, which suggests that modern medicine has replaced the traditional, "magic" medicine from Africa. A huge image of Hippocrates stares down upon the whole scene, perhaps suggesting his dissatisfaction that scientists have turned their back on primitive medicine completely (LeFalle-Collins and Goldman, 1996).

Another major theme of the Harlem Renaissance artists was the plight of the black working man and class struggles, a theme very much in contact with the Mexican muralists. Blacks did not have much opportunity for social mobility and were for the most part, what the campesinos were in Mexico- the manual labor force of the country. Blacks worked in the fields, women were house cleaners and very few landed white-collar jobs. In White's *Sharecropper* (1947-1948), the viewer sympathizes with the sharecropper, whose appearance is humble and sad, and whose shoulders are hunched over. Elizabeth Catlett's, *Working Woman*, also tells the sad story of a black cleaning woman who looks weary. *I Have Always Worked Hard in the Fields* is another testament from Catlett of the hard labor black farmers endured. In spirit of black resistance, however, Catlett painted powerful inspirational works, including *In Sojourner Truth, I Fought for the Rights of Women* (1947) and *In Harriet Tubman, I Helped Hundreds to Freedom* (1946). In relation to class struggle, Charles White painted, *Hear This*. The painted depicts an excited, blue-collar black worker attempting to convince a black man in a tie (suggestive of his class) of the importance of what is listed on that piece of paper. The man in the tie, however, appears indifferent and does not seem to care what the blue-collar man is telling him. This suggests the gap that exists between the two man as a result of their class, even though they are both black.

> The murals, easel paintings, and prints of African-American artists and the poems of Hughes and others provided visual, historical, and literary reinterpretations of the history of the black experience in the United States, with special emphasis on unequal treatment blacks had experienced under the capitalist system. For this reason they were particularly interested in the works of the Mexican muralists. Diego Rivera felt that the suppression of subordinate cultures was one of the main links

> between the oppression that workers experienced in Mexico
> and that which blacks endured in the United States
> (LeFalle-Collins and Goldman, 1996)

Although Langston Hughes does not necessarily fall into the category of painters, he was certainly a very powerful *artist* of the Harlem Renaissance. Through writing, Hughes discussed issues of racism, issues of injustice and issues of inequality. In his poem, "Scottsboro," Hughes assures the young black Scottsboro boys that they are not alone in their battle- the boys are condemned to die. The boys are a part of a larger, international fight for freedom and justice that includes the people listed in the poem. Like those martyrs, the truth and memory of the Scottsboro boys will live on (LeFalle-Collins and Goldman, 1996).

The Issue of Status in Puerto Rico
Internal Strife in the Search for Status

Dr. Paul Simon Maria Dolores Goddard

Puerto Rico has had, throughout their history, a government determined by someone other than themselves. Since the discovery of the island, and the invasion of the Spaniards, the island has had to abide by someone else's rules. The native people have had opinions on their situation throughout this period, but now *they* have been given the choice. The United States has determined that the island should have a say in the type of government they are being ruled by. This has led to extensive conflict in opinion. Opinions have exploded on the effects that this choice will have on the country. The concerns of what is occurring in Puerto Rico range from the effects on cultural history to the economic stability of its people. Statehood, independence, or the status quo as a commonwealth are the options available to the islanders. Which will be chosen, and the consequences of that choice are yet to be determined. An in-depth study of the present situation, and how the different options could affect that situation may give the reader a more thorough understanding about this determination, and further, give them a clue as to what to expect from the struggle for identity that is occurring in Puerto Rico.

The people and their values are a strong presence in Puerto Rico. Without an understanding of the people on the island, it would be very difficult to understand why emotions are so strong over the present situation. The Puerto Rican people have a strong heritage. Their history and their culture are important aspects of their lives. In other words, where they came from is as important, if not more so, than where they are going. The pride that is exemplified by *every* Latin American demonstrates the intense sense of heritage and soul for the culture.

History is also a vital part of the island's culture. Depending on the status chosen, there is a widespread belief that the island will lose part of its history to another culture. Therefore, it is a worthwhile effort to establish the island's history and understand the people that belong to it.

Christopher Columbus encountered the island on his second voyage in 1493, and claimed it as part of the Spanish empire. In 1898, at the conclusion of the Spanish-American War, Puerto Rico was ceded to the United States. After Puerto Rico was taken over by the United States, the island was considered a poorhouse, dependent on only one crop, sugar (Puerto 28). In 1901, the Foraker Act Amendments established a civil government on the island as opposed to the previous military establishment. United States senators were given the authority to assist with the island's government, and the languages on the island were expanded to two. Then, in 1952, commonwealth status was chosen to be a new type of government that encouraged a partnership between the two countries. The United States occupation was a turning point for the islanders as their situation became less bleak with economic interventions to help boost Puerto Rico's standard of living.

The United States has taken a strong stance in only one aspect of Puerto Rico's present situation: that they should have a say in their government. From the Presidential Notes of George Bush in 1992, the President noted: "As long as Puerto Rico is a territory, the people should periodically be allowed to vote on their political status by means of referendum" (Office of the Press Secretary 2324). This leads us to our present dilemma: if Puerto Rico has the ability to choose their political status, then what should they vote for? Most of the Puerto Ricans are confused. They are not sure what each status represents; further, they are unsure what consequences, pro and con, are involved with the choices they have. Patrick Marshall, author, makes note that in this type of situation, "Voters anywhere tend to vote with their pocketbooks..." (84). It seems the Puerto Ricans, in their uncertainty, vote for what they think will bring the most economic benefit to the island. However, I would argue that they are not looking beyond the short-term effects of the status issue. Therefore, what follows will be an in-depth study of each status available to the island, and what advantages and disadvantages each status brings with it.

The idea of commonwealth status was introduced in 1952 by the governor at that time, Luis Munoz Marin (Puerto Rico 28). The idea took flight, and on July 25, 1952, Puerto Rico declared "Constitution Day". Constitution Day was the day proclaimed by the island when a new precedent was set forth: from hence forth, the island became a commonwealth of the United States. This commonwealth was considered a "...voluntary association with the United States approved by the Congress of Puerto Rico through a plebiscite" (Gelabert 14). Further, the structure of the commonwealth agreement allowed for flexibility from both parties: Puerto Rico was permitted self-government in internal affairs and administration so long as they were subject to United States' laws (Office 2324). This agreement provided a mainframe for what was later to be called "The Union that Works" and "The Best of Two Worlds" (Passalacqua 104). It seemed that this union could establish for both parties benefits that outweighed the consequences. There was economic benefit to be gained, as well as political advantages: it has worked up to recently. There has been dissension on the island as people look towards bigger and better lives. The people that are dissenting argue that there are many disadvantages. That they lack the right to vote in presidential elections, and further, that the Puerto Rican people are not eligible for the same amount of welfare assistance as the people on the mainland are the disadvantages usually targeted by the opposition. Others argue that the island is becoming too dependent on the United States, and that they need to learn to stand on their own. However, extensive research suggests that the benefits that come to the island are much greater.

Several advantages that have been gained by the commonwealth are that the islanders are considered American citizens, and are able to travel freely into the mainland executing the same rights as any average American citizen. Also, the island has gained economic support from the United States government. The island is eligible for some welfare assistance, and the government supplies the island with a budget by which to disperse these benefits. However, the biggest benefit that has been gained by the island through United States intervention is the Section 936 tax break.

In 1947, the United States created a new policy to assist the economic situation of the island. The program was named "Operation Bootstrap". This program was based on industrial development through tax incentives and tariff rebates. This agenda was created with the intention of enticing American companies to move some of their business to the island to cut costs, and increase bottom line profits while providing Puerto Rico with new employment opportunities. In 1976, this operation was renamed to Section 936 of the Internal Revenue Service Code (Marshall 86). The Section 936 tax break states that there is a "100% tax credit to Puerto Rican corporations for income from a trade or business and from qualified investment income derived from Puerto Rico" (Donlan 28). It worked. The amount of business done in Puerto Rico today far exceeds the situation the island was faced with in 1898. An article from The Economist states that "Now, it is rich by Caribbean standards, with a strong industrial base" (29).

Another option has recently been introduced on the island; the option of "enhanced commonwealth status". This option would include an improved version of the 1952 commonwealth agreement, while maintaining the basic "union" structure. "Enhanced status" would include several key elements: first, there would be a provision for additional self-government on the island (still subject to United States laws). This would give the island the "enhanced" sense of autonomy in the governing body, an option that many Puerto Ricans desire. Also, the island would retain all incentive benefits provided through Section 936 and all programs for the poor that are currently in use while gaining several others (not yet determined). Enhanced status would provide for these additional programs through a new law that would make the island's population subject to Federal taxes. However, as a majority of Puerto Rico's population lies below the United States' poverty line, this seems like more of an economic gain than loss (Tochlin A12). If looked at as a whole, the "enhanced commonwealth status", as a recent article states, "...would give Puerto Rico the powers of a state with the exception that they would lack representation in Congress (A12). It seems to be that this plan, if it can be agreed upon extensively throughout the island, would best benefit the country. They would not have to give up their autonomy nor their culture, and yet the island would be gaining almost all of the rights of a state. The Popular Democratic Party, led by former Governor Rafael Hernandez Colon contends that "only an 'enhanced' status can protect the economy as well as the Hispanic culture" (Barrett 19).

The greatest opposition to the enhanced commonwealth status is statehood. The supporters of statehood argue that if the island is so close to being a state, the best thing they can do is to vote in favor of statehood so as to be on equal footing with the other fifty states. If the majority of the Puerto Ricans choose statehood, "Upon the issuance of said proclamation, the Commonwealth of Puerto Rico shall be declared to be a state of the United States of America, and shall be admitted into the union on an equal footing with the other states" (Kilpatrick np). Supporters of statehood emphasize two key advantages to becoming a state. If Puerto Rico were to become the 51st state, the island would acquire representation in Congress, with two senators and five or six members of the house. The island would also gain the right to vote in presidential elections (Tochlin A12). The New Progressive Party, led by former governor Carlos Romero Barceló argues that statehood would mean political equality and more food on the table through assistance programs. Other supporters highlight the fact that federal assistance programs will be instantly gained as opposed to waiting for the budget allotted them from the mainland to determine what help they will acquire (Barrett 19). For the supporters of statehood, these advantages outweigh those of enhanced commonwealth status. However, they will have much more difficulty attaining their goal than maintaining the status quo. This is due to the fact that in order to present a valid case for statehood to the United States, Puerto Rico needs approximately 70% agreement on the island (Dumas 4076).

Superficially, this all seems well and good. However, the case against statehood shows that it is not really the best option for the island. First, [statehood] is irreversible. If Puerto Rico chooses statehood, they are stuck; they will be a part of the union throughout their existence. In an air of such uncertainty, does it seem logical to do something one can't undo? Next, English now co-exists with Spanish as the official languages of the island. Statehood would seem to favor the use of English as a primary language on the island (38 Aniversario np). As one opponent to English as a primary language says, "[teaching English is] the latest effort as a not-so-veiled attempt to assimilate Puerto Rico, or at least portray it as assimilated" (Navarro np) Although English is a strong second language, there are islanders who do not know English, and to force upon them a new language that they do not understand would raise resentment toward the mainland, as well as anger and sadness for losing an important part of the Latin American culture they treasure. This leads to the next point: Puerto Rico would have to assimilate the North American culture. This includes losing much of their history to United States history. They would lose their culture as the prioritized language changed, politics change, and economics change. With so many changes facing the island, the only refuge they could seek is to assimilate, to "go with the flow". Unfortunately, they would be losing over 500 years of valuable history and culture in the process. Another valuable argument against statehood is the fact that although the island would gain instant welfare assistance, many islanders may not qualify for food stamps, Medicaid, or welfare under United States' new policies. With the budget included in commonwealth, the island is guaranteed a certain allotment; however, with statehood, each individual must fare for themselves. By far, the biggest disadvantage for statehood is something that would send the island into economic tumult. If Puerto Rico were to decide to become a state, the island would lose all special tax benefits for investment incentives (Tochlin A12). What this means is that the industries that came to the island to increase profit through tax incentive would lose that benefit. Although the incentive would only be gradually phased out, it is probable that most large companies would leave after the exemption is gone (Barrett 19). What this means for the island is that statehood would cause the loss of more that half of the 300,000 jobs that have been created through Section 936 (Puerto Rico 29). This would double the unemployment rate on the island to more than 30%. Not only does this type of tumbling effect affect the island, it would also affect the United States. It is estimated that to make Puerto Rico the 51st state, it would cost the treasury nearly $25 billion by the year 2000. And this is only the actual process; if tax incentives are lost, and unemployment rises, it will also increase cost in welfare and assistance programs (Barrett 19). This raises another important issue: even if Puerto Rico votes for statehood, would the United States accept them? They are not bound to accept the island if they choose statehood. There have been rumors similar to one found in the Economist that says, "Washington questions whether they want to admit to statehood (which involves two senators and up to seven House members) a Spanish-speaking island of 3.3 million people, more than half of whom live below mainland

America's poverty line" (Puerto Rico 28). There has been mention of initiating a "self-executing" provision in Senate committees, which would mean automatic admission to the states if the majority of Puerto Rico is mustered for statehood. However, this provision in still in the working, and may not even make it to the floor of Congress (Puerto Rico 28). It seems that statehood is more hassle than it is worth. There are several *key* losses to the island, including language and tax incentives, and only superficial gains (i.e. representation in Congress). So long as the United States continues to assist the island as they have done, it seems the most truth can be found in the old adage "If it's not broken, don't fix it."

There has been one other opponent to the status quo, although its presence on the island is minuscule. Independence is an option to the island, and there are radicals that would like to see this option chosen. However, up to 1952, these groups usually expressed their opinions with guns and terrorism; therefore, general sentiments on independence tend to be negative. Although the support for independence is small, supporters are convinced that America will never accept Puerto Rico as a state, and when the island is turned down for statehood that their own ranks will begin to swell (Puerto Rico 28). The obstacle toward independence is that the island would be required to be self-sufficient economically, and it is very unlikely the island could accomplish this feat. Further, Section 936 will be deleted under this option, posing similar problems to those of statehood. Without the industrial base that is so strong, independence seems a long shot in all practicality for the island.

November 14, 1993 marked only the second time in Puerto Rico's history that people were able to freely express their opinion on the island's political future (Passalacqua 104). 80% of the 2.1 million registered voters practiced their right to vote (Dumas 4075). It is interesting that the Puerto Ricans refer to "celebrating" an election rather than just having one. It shows the importance they place on their right to express their opinions. The 1993 plebiscite showed the following results:

48% of the voters voted for commonwealth status
46% of the voters voted for statehood
05% of the voters voted for independence (Aleinikoff 16).

The plebiscite shows the relative closeness of the vote. It seems that most people were very confused by the overabundance of campaigning that occurred before the election, and many votes were not based on actual understanding of the island's options. It could be argued that if education on the real issues of each status would have been fairly distributed throughout the island, the vote would have shown more prominent results. Therefore, a new focus on education needs to be implemented to ensure well-informed voting in the future.

A new movement has sprung up on the mainland, and depending on the outcome of this movement, it could drastically affect the status issue. In December of 1995, Congress voted and *passed* a new law, the Omnibus Budget Reconciliation Act of 1995. What this act consisted of was a complete phase out of Section 936 for future investment, with a grandfather clause for existing 936 corporations. Fortunately for the island, this law was vetoed by the president, and no new actions have been disclosed at this time (Griggs). Surprisingly, the pro-statehood governor of Puerto Rico, Pedro Rosello, was not opposed to this repeal, but did propose an alternative plan. The alternative plan, named 1397E of the Internal Revenue Code, said that any state or territory meeting certain criteria would be eligible for tax breaks. One eligibility factor was that the business had to derive at least 80% of their gross profit from active conduct of a business or trade within certain jurisdictions (Griggs). The new proposal is difficult to understand in context; however, any repeal of Section 936 would create atrocious repercussions throughout Puerto Rico.

The status debate comes down to an argument between national dignity versus economics. Supporters of independence and statehood argue that Puerto Rico must "rid the shackles of colonialism"; supporters of the commonwealth argue that there is more money to be had where they are while maintaining identity (Puerto Rico 28). One thing is certain, "all of the parties are exhausted, financially and otherwise" (Dumas 4078). Further, it seems that the people are overwhelmed with propaganda and publicity. The island needs to step back and remember that they are brothers and sisters, and no matter the status chosen, they must stand tall as Puerto Ricans The struggle for identity has the capability to bring disaster to the island, but if the people educate themselves, they will see above all the talk that their identity remains As Carlos Romero Barcelo says, "Something that all of us know to be true in our hearts and in every fiber of our being that we who are Puerto Ricans are not about to give up our identity for anybody" (Kilpatrick np) The cultural history of the island will hold them together While statehood and independence parties fight with the supporters of commonwealth, the people will continue to listen Commonwealth has been shown throughout this discussion to hold the most advantageous position for the entire island Although there are drawbacks, it seems that the benefits outweigh the shortcomings Further, if looked at on a long-term basis, as opposed to short-term benefits, it is obvious that commonwealth has the most to offer It is a struggle for a country to ascertain its situation and make educated choices without being subjective in their decisions However, the island is in good position to maintain economic prosperity while holding onto the culture they so dearly cherish The struggle goes on, but if one looks at where the island has come from, it seems that victory has already been accomplished

Multinational vs. Global Organizations: A Case Study of the Corporate Culture of IKEA

Dr. Peter Hackbert

In the mid-1980's, IKEA was a successful multinational organization. As they continued expansion to include Canada and The United States, they encountered problems with their employees within the host countries. These problems reflected the domineering approach to training employees and the ethnocentric tendency of the company and its management team.

Based on a case study of the IKEA Corporation, we found these to be symptoms of a multinational organization. In our research, we found that IKEA needed to focus on becoming a global organization. We explain the difference between multinational and global organizations and how that relates to the problems experienced by IKEA. Also, we offer steps on how to make IKEA a global organization and solve the problems they encounter with host country employees.

INTRODUCTION:

As the twenty-first century quickly approaches, the business world is experiencing rapid changes and opportunities on a global scale. However, as global markets open up corporations are faced with many new challenges. IKEA is one of many corporations facing these challenges and overcoming these challenges. The purpose of this paper is to identify areas of improvement and offer solutions to IKEA, based on The Harvard Business School case study published in 1988.

BACKGROUND:

IKEA was originally founded in 1943 by Ingvar Kamprad. It had a humble beginning as a mail order company, but quickly expanded by fulfilling a basic market niche. In Sweden between the years of 1935 and 1946, the price of furniture rose 41% faster than other household goods (Bartlet, 1996). With this in mind, Ingvar developed IKEA with a single objective to, "offer a wide range of home furnishing items of good design and function at prices so low that the majority of people can afford to buy them (Bartlet, 1996)." All aspects of IKEA today reflect this basic notion of providing low cost furniture. There are no sales people on the floors. The stores are built with cost in mind. Assembly is completed by the customer not IKEA.

Ikea's corporate culture is based on Swedish traditions and philosophies. The corporate executives are mostly Scandinavian to create a homogenous group. IKEA prefers to hire younger people, who have not, yet, had the chance to experience corporate life. This keeps their (IKEA) costs low and makes it easier for the managers to adjust to the corporate culture. The culture is very ethnocentric in its tendencies. The Swedish dedication to your job is expected of all employees, along with being very casual at work, always being cost-conscious, and being independent. Promotion within IKEA comes very quickly to those who have the Swedish trait, "odmjukhet" or have modesty, humility, and respect for people (Bartlet, 1996). It is felt that the purchasers should remain Swedish to promote the cost-consciousness, that is believed to be inherent in natives to the Smaland area. Distribution and design are, also, controlled locally despite international expansion. The rest of operations are divided into geographical areas and controlled by regional managers.

The current policy for opening international stores involves two phases. The first phase is involved in finding land and building the store, as well as hiring employees. After about a year of putting the system in place, the second phase starts, in which the operations group takes over permanently. The only guidelines for the expansion group is Ingvar's "Furniture Dealer Testament," which basically outlines the core philosophies that Ingvar found most important. He went so far as to train ambassadors to teach and convey this philosophy to other parts of the company.

Ingvar started expanding into Europe in the early 1970's, despite attempts by local retailers to stop IKEA. By 1976, IKEA's success lead to expansion in Canada and Australia. In 1986, Ingvar made the decision to break into the world's largest retail furniture market, the United States, estimated at $35 billion annually (Kelley 1987). As of 1989, IKEA had a total of 69 stores, 57 outside Sweden and 12 within.

ANALYSIS:

IKEA's rapid expansion into the US markets is changing the dynamics of the corporation and they are encountering many problems with the way the current business operates. IKEA is having problems integrating US employees to the Ikean way. This is due to the fact that both rapid growth and additional employees from expansion into new geographical areas, cause corporations to evolve, specifically corporate cultures (Irwin, 1995b).

Also, this change is putting pressure on IKEA's traditional system of ethnocentric policies. IKEA currently follows the practice of keeping the corporate levels dominantly Scandinavian. While this is successful and often necessary in some areas, it "can lead to 'cultural myopia,' the firm's failure to understand host-country cultural differences that require different approaches to marketing and management (Irwin, 1995a)." This is already a problem, as is evident in the statement by IKEA's head of North American operations, "it has been hard making the IKEA way their way of life here in the US (Bartlet, 1996)." IKEA does not recognize that the US has a very distinct culture and that it is completely different than any previous cultures they have encountered, nor do they see the need to change their own corporate culture.

The above mentioned complications of IKEA's US operations are just that, complications of a bigger problem. IKEA's rapid expansion has brought them to a global level in the furniture retailing business, but the corporation itself is not prepared for this level of business.

According to Stephen Rhinesmith, organizations go through four stages in the process of becoming global organizations. These stages are "domestic, export, international/multinational, and global (Rhinesmith, 1991)." IKEA is currently at the multinational level and is encountering problems because their markets are rapidly becoming global in scale. They will lose their competitive advantage in the US market, if they don't take immediate steps to adopt the characteristics of a global organization. Rhinesmith defines a multinational organization as one that equally distributes manufacturing and technology throughout the company. Also, they have a centralized view of strategy, technology, and resource allocation. IKEA's operations are still run out of Sweden. Another aspect of multinational corporations is how they adapt resource allocation based on international competitiveness (Rhinesmith, 1989), just as IKEA has relocated their furniture supply when different nations have offered low cost options. However, despite having stores in locations around the world, IKEA is not a global corporation.

A global organization's "structure is used to unify the operations in each country (Irwin, 1995c)." A global organization's strategies are not just domestic models changed to fit local markets and cultures, but are, "integrated wholistic strategies(Rhinesmith, 1991)." Rhinesmith re-enforces that global organizations are organized, so that, national boundaries and cultures are not barriers to potential business or manufacturing opportunities. Unlike multinational corporations, global corporations have the mindset of being world citizens.

A global corporation has specific characteristics. There are three areas that must be addressed and changed in a multinational corporation to make it a global organization, strategy/structure, corporate culture, and human resources (Rhinesmith, 1991). Rhinesmith points out for this to be successful, change in all three areas must be addressed.

SOLUTIONS:

IKEA needs to start taking steps towards becoming a global corporation, now. An organization cannot change overnight, especially when traditions and cultures are involved. It will be a slow process to make IKEA a global corporation, but a necessary move for them to remain competitive in the future, where technology will quickly lower cultural and geographical barriers. IKEA needs to address the three areas outlined by Rhinesmith, simultaneously, with specific steps to be taken and goals to be obtained.

First, IKEA needs to put together a task forced designed to study their global strategies and structure. This task force needs to be a cross functional and cultural team. The task force needs to learn to work as a team to identify changing conditions and make decisions on what courses of action need to be taken. Their study should involve becoming "globally centralized." This means looking at the feasibility of keeping operations like distribution and purchasing located in Sweden. Also, re-evaluating strategies in local markets and deciding, if certain tasks would be better centeralized or, perhaps, decenteralized. The new strategies need to include a global vision to meet the competitive needs of the future.

Second and most important for IKEA, is they need to evaluate their corporate culture and take steps to make it more globally oriented. IKEA must focus on retraining top executives to transcend cross-cultural barriers and diversify their homogenous group. They need to develop a mission statement outlining their commitment to becoming a global corporation. Specific goals should be developed so that their progress can be evaluated.

Another area IKEA needs to start making changes in is human resources. Despite growing sales and profits, dissatisfaction among foreign workers indicates a need for change. This change needs to occur within all management levels, top, middle, and low. They need to adjust their staffing policies to promote managers from foreign countries to bring in new ideas and viewpoints. IKEA needs to diversify their executive team to include managers native to the host countries of their stores. The group in charge of opening new stores needs to be educated on the local culture, through training and orientation programs. This will allow IKEA to be able to meet the needs of foreign employees.

CONCLUSION:

IKEA needs to reevaluate and change its corporate culture to reflect globalization. As the company stands now, it is successful internationally, but lacks the diversity, culture, and the mindset of a global organization. These skills are needed to respond effectively to changing global needs from all regions within the company. The managers in charge of opening new stores require more training within the host countries. They need to completely understand the local culture and be willing to adjust IKEA's culture to fit it. Another aspect necessary for IKEA to become a global organization is to develop cross-cultural teams. These teams need to be involved in global and strategic planning and focus on the idea that all members are equal. Most of all, IKEA needs to focus on becoming "world citizens" by adjusting their attitude toward cultures and the differences between them. In doing so they will remain in the global market and be prepared to deal with the growing changes in the world economy.

If management does not recognize this weakness now and start planning to develop a global corporate culture, they will jeopardize their prosperity for the twenty first century. Trade barriers are dropping and world markets are opening up. Therefore, corporations are striving to be the best suited to adjust to every culture and market. These are qualities that take time to develop and if IKEA hesitates they will be left behind.

INTRODUCTION

If someone asked you to list the three most important events in the history of the United States, your list would probably include some of the following: the European "discovery" of the Americas, the Revolutionary War, the signing of the Declaration of Independence, the writing of the Constitution, the abolitionist movement, the Civil War, World War I and II, the civil rights movement. And almost all of these -- in fact every one, with the possible exception of the civil rights movement -- were organized or led by a select group of men who were in power at the time.

In an attempt to cover what they consider the most significant, or at least the best known, pieces of our history, historians are forced to focus on a few isolated individuals. They cannot tell the story of everyone. Feminist scholars argue that historians have consistently neglected the role women have played in societies, but in fact, the histories have neglected much more than just women. Traditional history is not the history of the common person; it is the history of major events and the few people who were intimately connected to those events. For every example of a woman leader in early Christianity, someone could probably recite over one hundred examples of male leaders. But that does not mean that the women were unimportant. To learn the significance of these women, to realize the effect they had on the early Christian communities, we must study them as we would study any other historical figure -- with depth, precision and skepticism. Only after we have done this can we form an educated opinion on the roles of women in the early Christian tradition.

PHOEBE: DIAKONOS AND PROSTATIS

Concept: Paul

Paul was a Jew, a Pharisee, who experienced the revelation of Jesus Christ circa 33 CE and decided to devote his life to spreading Jesus's teachings across the Mediterranean world. He traveled to many different communities, where he would live and work among the people. Many of the people, Gentiles at the time of Paul's arrival, would become followers of Christ. Paul would build up a local community of believers, train individuals as leaders, and then move to another city.

Paul continued to monitor the religious communities long after he had left, via his letters, which now comprise a significant portion of the New Testament. In one of those letters, a letter from Paul to the Romans, he mentions a woman named Phoebe, whose case will be examined by this paper. Phoebe has a connection with a church near Corinth, and the confusion and discussion lies in what exactly was her role.

The Text: Romans 16: 1-2

> I commend to you our sister
> Phoebe, a deacon of the church at

233

> Cenchreae, 2 so that you may
> welcome her in the Lord as is fitting
> for the saints, and help her in
> whatever she may require from you,
> for she has been a benefactor of
> many and of myself as well.
> (Text from the NRSV, the New Revised Standard Version of the Holy Bible, 1989)

Our Thoughts:

Within the Hebrew Bible or the New Testament there are many examples of women taking leading roles in the early Christian churches. But there are also many examples where women are relegated to menial roles. So how come no one knows about these women? What did the original authors mean? As we have already discussed, no one can know for sure what the authors intended. The texts were written so long ago and have since been translated into so many variations, that it is virtually impossible to get unanimous agreement from an individual church, let alone a denomination or the religious world as a whole.

So what is our recourse? Our only option is to return to the primary evidence. When we are confronted by unclear passages, we must cross reference them with other passages from the New Testament or historical evidence from the time when the texts were written. This is not merely the process of translation and historical research, it is the search for women in early Christianity.

Romans 16 from the New Testament is prime material to illustrate how the understanding of the role of women has been affected by translations. In Romans 16:1, Phoebe is commended as "a deacon of the Church at Cenchreae." In the original Greek manuscript, Phoebe is referred to as *diakonos*, which, when translated into English, means "one who serves or ministers to." Thus far, this translation by the NRSV is accurate. However, other translations--the Revised Standard Version, for example--translate *diakonos* as deaconess. This suggests that the original word Paul used was *diakonissa*, the feminine form of *diakonos*. There is a problem with that suggestion; the word *diakonissa* was not used in the time Paul wrote. The role of deaconess, which evolved at a later period, was the ministry to other women. In referring to Phoebe as a deaconess instead of as a deacon, her position as a woman of authority in the church becomes clouded. Paul, in writing this letter, did not give any indication that Phoebe's position was inferior to others he had referred to as *diakonos* (Timothy, for example in 1Thessalonians 3:2)

Why would this change occur, if the word *diakonos* has such a clear, unambiguous meaning? The answer to that question constitutes the very essence of the translation dilemma. To understand the problem with translations one must first recognize the fact that no written text is entirely objective. Authors bring a particular bias to their work based on what they have learned and experienced in their lifetime. An honest and experienced writer seeks to minimize the effect of the bias on his/her work, or, at the very least, owns up to it. The same is true for translators and copyists; people who worked on translating the original Greek manuscripts brought to the texts their own preconceived notions of the religious authority of women. If a detail in the original manuscript appeared to be untrue, it could be altered to better represent what was believed to be factual. We do not believe that this was done as a vengeful act upon women; more probable is that the translators were doing their job based on what they knew. It is unfortunate that by the time many of the translations were done, women had lost much of the role they had previously held in the church. Now, it is left for scholars to attempt to uncover what the reality was concerning women in the early Christian church.

Another example of this translation problem occurs in Romans 16:2. The same woman, Phoebe, is described as "...a benefactor of many and of myself [Paul] as well." The word benefactor was somehow derived from the Greek word *prostatis*. *Prostatis* is the feminine form of *prostates*, which is translated as a leader or chief of some kind. The original word, *prostatis*, describes Phoebe as a leader of many. The word "benefactor", while indicating wealth and some degree of power, takes away Phoebe's position as a leader and religious authority. One problem that surfaces in discerning the true meaning of this word is the fact that the feminine *prostatis* appears only once in the New Testament.

BEST COPY AVAILABLE

Thus, we cannot look to other passages to see what position this word previously referred to. However, the main point is still evident; the role of Phoebe is understood differently when the translations stray from the original meaning of the word. The evidence assures us that Phoebe was a woman of importance in the early church. Although many translations have downplayed her role, she still surfaces as an active woman in early Christianity.

CONCLUSION

When researching the role of women in the early Christian tradition, one is often confronted with many pieces of evidence from which individuals could draw drastically different opinions. The greatest source of confusion when working with biblical texts is differences in translations. To combat this problem one must refer to the original manuscript and examine the historical context of the evidence.

For Better or For Worse: The Case For Gay Marriage

Kathrine Ehrlich

Department of Philosophy
Wells College
Aurora, NY 13026

Faculty Advisor: Laura Purdy

Baehr v. Levin, a state Supreme Court case in Hawaii, challenged a Hawaiian law defining marriage as limited to unions of a man and woman. The U.S. Constitution's full faith and credit clause would have made forty-nine other states recognize a new Hawaiian marriage law prior to the *Defense of Marriage Act*, and so the issue of gay marriage was thrust into the public spotlight with the speed of a runaway freight train this past year. Some have even argued that the gay marriage debate will be to the 1990's what the abortion debate was to the 1980's. While some see gay marriage as a threat to one of society's most fundamental institutions, I believe the real debate hinges on exactly what "marriage" is, who defines it and the role of marriage as both a public as well as private institution within society. This paper seeks to explore the seemingly changing definition of marriage and the issues involved in marriage's public and private realms. From there I will set up my arguments in favor of gay marriage, lay out the objections to gay marriage and then refute those objections. Extending marriage rights to gays would hardly be a threat to one of society's most fundamental institutions. Instead, recognizing marriage as a right to all couples regardless of sex would force marriage laws to take into account such issues as equality and separation of church and state and would reflect in its new definition the fact that social institutions are not carved in stone but must adapt to changing times.

At the heart of this debate is the question of what marriage is. I will outline briefly the most common-thought purposes of marriage. The state has a vested interest in the role of marriage for procreation. "A family is not an association of independent people; it is a human commitment designed to make possible the rearing of moral and healthy children. Governments care- or ought to care- about families for this reason, and scarcely any other" (Rauch 21). Others hold that marriage provides a "ready-made" caretaker in the event that one spouse becomes sick and in need of care. Marriage is also about more than the couple. It is a public declaration of commitment in which friends and families are thought to have a role (Graff 93). Last of all, marriage is a legally binding commitment for consenting adults with enforceability (unlike domestic partnership agreements).

The gay marriage question also raises questions about the role of the state in defining marriage. "There is obvious tension between the states' power to define marriage and their obligation not to interfere substantially with decisions to enter into a marital relationship" (Hohengarten 1505). Two Supreme Court cases in particular address the question of the state's role in defining marriage. In the first, *Loving v. Virginia*, Virginia's antimiscegenation statute was struck down based on the Equal Protection Clause. The Court held that, despite long-standing tradition to the contrary, the state had no right to deny the Lovings marriage based on race and that they not only had the right to marry but that it was a fundamental right.

The case of *Zablocki v. Redhail* attacked a Wisconsin statute making it illegal for a person to marry if he or she could not pay preexisting child support obligations. The Court reaffirmed the *Loving* decision that marriage is a fundamental right, and also took it a step further, defining it as a privacy right grounded in the Constitution. "Under *Zablocki*, the state's power to define the legal relationship of marriage does not encompass the power to exclude persons from it" (Hohengarten 1507). The question then becomes whether marriage as an institution excludes same-sex couples or whether it is the state which has done so arbitrarily. *Loving* puts into question whether the distinction between same-sex marriage and marriage in general is any more constitutionally (and morally) relevant than was the distinction between couples of the same race and those of differing races (1511).

Gay marriage also tears apart traditional notions about gender roles within the institution. Gay marriage is about more than homophobia; it's about the changing definition of family. Surely, if gays were to marry it would be impossible for there to be any division of labor within the marital relationship solely on the basis of sex. In this way, "hostility toward homosexuals reinforces traditional sex roles, which have worked to the great disadvantage of women" (Koppelman 23). Any person exhibiting behavior which is not deemed appropriate for their sex have for ages been subject to the accusation of being a homosexual. "Indeed, the two stigmas- sex inappropriateness and homosexuality- are almost interchangeable" (23).

I have discussed the definition of marriage: its purposes, the role of the state in defining those purposes as well as the players and roles of the players within a marriage. I now turn to the notion of marriage as both a public as well as a private institution. First, the public side of marriage. "Marriage is not something that exists apart from the law or state. Marriage is a legal relationship, entered into through a legal framework, and enforceable according to legal rules" (Hohengarten 1496). What is inherently wrong with this is that marriage has been exempt from such legal principles as equality and freedom (Ketchum 264). More specifically, marriage has been traditionally held to social contract theory contending that there is a state of nature where everyone is equal. It has been assumed by some philosophers, however, that in nature the "authority of husbands over wives is a natural authority" (Ketchum 265). There are other inconsistencies, as well. Take the issue of the economic and legal "rewards" that come with marriage. These are not general rights bestowed upon everyone, but special rights reserved for those within the marriage bond (265). In this way marriage violates the principle of equality by denying these rights to homosexuals.

Another facet to the public realm of the gay marriage debate is legal recognition in and of itself. As a people we tend only to recognize issues on a legal level that we collectively agree with on a moral level. Legal recognition is often interchangeable with moral approval (Frame 73). As always, the question becomes "whose morals"? What makes my morals any better than those of the next person and why do I have the right to impose my morals by law?

This is a good question indeed, for it deals with an institution which in some respects has been absent from the political debate due to its definition as private and hence "apolitical and uncriticizable" (Ketchum 264). However, it becomes clear that in the case of marriage the personal, or private, is also political if majoritarian views about the purpose of and players within a marriage become institutionalized into majoritarian law. It now becomes necessary to look at the role of marriage as private- that is, marriage as being about religion and love and separate from the state: or is it?

Marriage has a religious and private side as well as a legal and public one. It is here where the gay marriage debate becomes most perplexing. No one can refute that Judeo-Christian teaching not only condemns homosexuality, but that this strand of thinking has found its way into law. Just look in the Bible at Leviticus 20: 13, "If a man also lie with mankind, as he lieth with a woman, both of them have committed an abomination." As recently as *Bowers v. Hardwick* anti-sodomy laws have been upheld around the U.S. Although we recognize the principle of separation of church and state, it does not look like this in reality. However, not all faiths reject homosexuality, and many strands of faiths do perform "marriage" ceremonies. The state cannot force any religion to perform any such ceremony, but even for those that do, such ceremonies are not backed by the force of law. In any event it is hard to doubt that the very basis of our marriage law stems from Judeo-Christian teaching. It is interesting that marriage is not only seen as a right but a fundamental right (*Loving*), as well as grounded within the constitutional right to privacy (*Zablocki*), yet this right to privacy in no way encompasses homosexuals. It seems that for homosexuals, marriage is hardly a private matter at all.

I have laid out the more general issues involved in the debate over gay marriage, but I would now like to turn to the issue of gay marriage specifically. It seems as though the most common-held purposes of marriage outlined in the beginning of the paper not only apply to opposite-sex couples but also to couples of the same-sex. Surely, gay couples do raise families. If gays were allowed to marry, instant caretakers would be provided for many gay couples just as they are for straight ones. Gay marriage could also serve as both a formal declaration of commitment and as legally binding commitment if marriage rights were extended to gays. In other words, there is no purpose for marriage which has previously been outlined which would not apply to same-sex couples, just as it applies to opposite-sex couples. In this way it is not the institution of marriage in and of itself that prevents the inclusion of same-sex couples.

In arguing against gay marriage conservatives will point out that marriage is primarily for the purpose of procreation. Conservatives argue that people get married because they love one another, that this love translates into sexual attraction which in turn should translate into the rearing of children by the couple (*Commonweal 5/17/96* p6). Because they are unable to procreate, society has no vested interest in homosexual couples from the start. "Whether homosexual relationships endure is of little concern to society. That is also true of most childless marriages, harsh as it is to say" (Schiffren A21). Schiffren also argues that the economic benefits that come with marriage are in place to help couples raise children. Taking the argument one step farther, David Frum argues in "*How Far Do We Take Gay Rights?*" that in order to decrease social ills (defined as "bringing into the world children who will learn less in school, earn less at work, commit more crimes, suffer more sexual troubles, and adjust less well to society") the family needs to be promoted. "Not 'partnerships,' but marriages, between fathers and mothers, lasting for life. And any serious attempt to promote real marriage as an institution necessarily precludes- and excludes- almost every single item on the gay-rights agenda" (Frum 69). Conservatives see social ills as resulting from "fatherless" families, wherein families are defined as heterosexual in origin.

Although gays do have families, they must make use of artificial means and third parties in order to have them. Frum argues against lesbians impregnating themselves through the use of sperm banks or by any other means because the resulting child will be raised without a father. "Everything we have learned over the past two decades about the effects of fatherlessness on children screams at us to try to discourage them- or at the very least refuse to encourage them" (72). Frum views adoption in the same way. Frum continues that trying to accommodate minority lifestyles is no way to raise a family and no good reason to re-define the institution of marriage. Conservatives also question whether gay marriage will serve as a stabilizing factor as they hold that it does in heterosexual relationships. "...the argument that legal marriage will check promiscuity (by gay males) raises the question of how a piece of paper will do what the threat of AIDS has not" (Schiffren A21).

Already touched on briefly was the conservative thought that the legal and economic benefits of marriage are in place to encourage the rearing of children. Along with this train of thought is the argument that extending such rights to gay couples would be an additional burden on the federal treasury which is already strained. Also, it would be a burden on taxpayers who would be subsidizing a lifestyle that many of them don't agree with (*U.S. News and World Report* 6/3/96 p31).

Some conservatives argue that gays already do get certain economic rights through recognized "domestic partnership" agreements. They argue that domestic partnerships could serve as a substitute for marriage for gays. Some companies already recognize such domestic partnership agreements and give benefits to a gay worker's partner such as health and life insurance and leaves for paternity or maternity. Among such companies are Disney, Covington & Burling and Coors Brewing Company (Underwood and Shenitz 83).

There are also gays who are against the whole idea of marriage and would favor something looking more like a "domestic partnership" agreement. Lesbians worry what the power of the state to define their relationship would in fact do to such relationships, and about the implications of such a thing as divorce which comes with ideas already in place about the dissolution of partnerships. Some lesbians "worry about changing the fluidity of lesbian relationships, which now has no sharp knife dividing that early dance with girlfriends from the shift into a committed partnership from the notable (though not universal) lesbian habit of separating into lifelong friends" (Graff 94). Some gay men share similar opinions. The problem, they say, is with marriage itself. Gays tend to organize their lives "more like extended families than nuclear ones" (Browning *A23*). "We may love our mates one at a time, but our 'primary families' are often our ex-lovers and our ex-lovers' ex-lovers" (Browning). Browning goes on to say that marriage tends to isolate a couple which for gays would mean that extended family members become "second-class citizens." Other homosexuals contend that fighting for marriage rights would be giving into an anti-homosexual mainstream and also to an "outworn institution" (Stengel 53).

Conservatives tend to favor "domestic partnerships" over gay marriage because many say that the inclusion of gays in marriage would pose a threat to the very institution of marriage. David Frum contends that including gays in marriage would be a parody of the institution. "The harm inflicted on the prestige of marriage is likely to prove very great; the last thing an already troubled institution needs" (72). As stated before, Frum also argues that we cannot change the definition of one of society's most fundamental institutions just to accommodate a minority lifestyle.

In this light, conservatives do not disagree that our collective moral view has been influenced by religion. "Though many of us are uncomfortable using religious language to discuss social and political issues, Judeo-Christian morality informs our view of family life" (Schiffren A21). Along the same lines they argue that such thinking has produced stable environments in which to rear children for many years and that we should not tamper with such a good thing. Minority lifestyles do not seem to matter as long as majoritarian lifestyles are looked upon by the majority as having the optimum effects.

Refuting such conservative arguments as presented above does not prove to be a difficult task. First is the procreative vision of marriage. Marriage, however, is not specifically designed for procreation. Any conservative arguments which hold that it is are certainly not considering heterosexual couples who choose not to have children, elderly couples or sterile couples (Stengel 53). Yet, these couples do not have their marriage licenses taken away when there are no resulting children. In applying for a marriage license no heterosexual couple has to disclose whether or not they want or are able to have children. To do so would be a gross violation of privacy. Why then, do we withhold marriage rights to homosexuals due to their lack of ability to procreate as a couple? Here it would seem that it is not the institution of marriage which excludes same-sex couples, but the state's definition of who can participate in marriage. Some conservatives claim that it is not necessarily the ability to procreate that is important, but the fact that the couple has the correct anatomical parts to do so (*Commonweal* 6-7). However, if the state's only interest is in unions which can promote children, why are these couples allowed to marry in the first place?

Furthermore, it has been established through two Supreme Court cases in particular that "the right to be free from state interference in decisions about family is logically prior to and independent of any abstract right one might have to engage in sexual conduct (Hohengarten 1523-1524). In the first, *Bowers v. Hardwick*, the Court upheld a Georgia anti-sodomy statute, making it legal to prevent two persons of the same-sex from engaging in sodomy. However, the right to engage in sexual activity does not precede the right to marriage. "*Bowers* does not imply that the state may also prohibit two persons of the same sex from marrying each other. Engaging in same-sex sexual conduct might not be a fundamental right, but the right to marry is one. As a result, the state may not use its power to regulate same-sex sexual conduct in order to prohibit same-sex marriage" (Hohengarten 1524). In a second case, *Griswold v. Connecticut*, the Court over-ruled a Connecticut statute which prohibited a married coupled from using or getting counseling in using birth control. The Court deemed this as a violation of a married couple's privacy rights, since the state could not interfere with the couple's sexual relations because the couple was married. "...marriage was thus the precondition of the couple's sexual liberty, not vice-versa" (Hohengarten 1525).

If procreation were a precondition of marriage then it would logically follow that the inability to have children would be grounds for divorce. In New York State for example, this is clearly not the case. Under New York law there are four grounds for divorce: "cruel and inhumane treatment of the complaining spouse, abandonment for at least a year, confinement in prison during the marriage for three consecutive years, and voluntary commission of the act of adultery" (Hohengarten 1515). In looking deeper into the adultery aspect of this divorce law it becomes pertinent to ask why adultery is grounds for divorce. It could either be because the act could result in the creation of offspring outside the marital relationship or due to the resulting cruelty inflicted on the non-adultering spouse. New York law, however, recognizes as adultery acts that would result in the creation of offspring as wells as acts without procreative powers. "As grounds for divorce adultery includes sexual relations between a spouse and another person of the same sex ," so it becomes clear that it is not that adultery could result in offspring which make it grounds for divorce, but the fact that it "interferes with and undermines the intimate commitment of the married couple" (1516).

Many conservatives feel that a "family" is defined as mom, dad and offspring. They seem to gloss over the fact that gays do in fact have families, or else they counter this with the fact that gays can only have such families as the result of artificial means or third party involvement. They see gay parenting as "fatherless" (or "motherless") and think it will result in social ills. First of all, many heterosexual couples must also turn to artificial means and third parties in order to have children. Does this make the resulting child any less loved, wanted or "legitimate"? These conservatives don't seem to be attacking heterosexual couples that go to extraordinary lengths in order to have children; that's respectable and proves how wanted the resulting child is. When homosexual couples do the same things, it's no longer about love; it's a gross perversion of this conservative idea of family. Gay parenting is also not single parenting. It is not "fatherless" or "motherless." Gay marriage shatters the traditional notions about gender role stereotyping within a family. Children within these gay unions still enjoy and reap the benefits of having two parents. It's just that the roles of these two parents are not designated on the basis of sex. If anything, children within gay marriages are seeing a more egalitarian picture of marriage. There is also no evidence supporting the conservative claim that having gay parents is a detriment to a child. When adopting children we put adoptive parents through a great deal of scrutiny which is never required of biological parents. As long as homosexual couples "meet those same tests of good character, it is hard to see why their sexual orientation should be held against them" (Coyne 69). Gay marriage could also promote stability and long-term commitment in a way that "domestic partnerships cannot (*U.S. News and world Report* 6/3/96 p31).

Currently gays do not receive the legal and economic benefits of marriage which were outlined earlier in the paper. This is clearly a case where marriage runs counter to principles of equality. Cutting off same-sex couples from such benefits is discriminatory. Gays are paying into the system through taxes, but can't legally reap the rewards. Conservatives claim that it will cost a great deal more to extend these rights to gay couples, but since when can we deny groups their basic rights just because it will cost more? Also, not all of these benefits are solely to aid in the rearing of children, as Schiffren claims (putting aside for the moment the fact that gays also rear children). It is nothing more than sex discrimination to deny these benefits to gay couples. Perhaps the question that should be posed is whether or not many of these benefits should be awarded on an individual basis instead of available only through the marital relationship (Pollitt 9).

Although certain companies award such economic benefits through recognizing "domestic partnership" agreements, these agreements are not the equivalent of marriage. First of all, domestic partnerships do not have the same full legal status that marriages do. They are also not commitments which are enforceable by law, and may not be recognized universally. "Although (gay) couples may enter into an enforceable contract governing their reciprocal property rights, they may not enter into an enforceable commitment to remain together" (Hohengarten 1501). There is no substitute for marriage because the "power of marriage is not just legal but social. It seals its promise with the smiles and tears of family, friends and neighbors" (Rauch 23). It does things domestic partner laws do not. Again, by making gays conform to domestic partner laws while heterosexuals have the right to a marriage is nothing more than the "separate, but unequal" principle revisited.

Conservatives will also claim that extending marriage rights to gays would be a threat to the institution of marriage itself. How then, do Tom and Harry or Sue and Patty threaten Bob and Sally? Conservatives can't have it both ways: "accusing gays of being promiscuous and then denying them the right to incorporate into monogamous, legally recognized relationships" (Rich A19). Perhaps what conservatives most fear is the mainstreaming of homosexuality; of deconstructing homosexuality as "the other." "We draw the line when gay sexual mores imitate our own. So long as they prowl the bathhouses or parade around in drag, we are not discomforted. As incomprehensible others, they are, as it were, comprehensible: in caricature is comfort"(Coyne 66).

It seems that much of this discomfort has its base in the indoctrination of Judeo-Christian teaching which has crept into majoritarian law. We simply can't have a law based on the book of Leviticus. It is a gross violation of the principle of the separation of church and state. Since the law already encompasses this anti-gay majoritarian principle, extending marriage rights to gays is not special rights but equal rights. Homosexual couples are claiming "the same right to marry as everyone else, not a special right to marry reserved for same-sex couples" (Hohengarten 1509).

In conclusion, there is no doubt that marriage rights should be extended to same-sex couples. Just because marriage is one of the fundamental institutions of society doesn't mean that it's definition, players or roles of players can not change. We need to ask if tradition is enough in and of itself to justify the exclusion of same-sex couples. If the *Loving* case is any indication, then tradition is not enough. Marriage's role as both a public and private institution should encompass same-sex couples. On the public side same-sex couples should have a right to the legal and economic benefits of marriage since anything else is sex discrimination. Extending these rights through domestic partnership laws is not a sure thing, nor is it marriage. Privately, same-sex couples have a right to be free from institutionalized Judeo-Christian law. Just as the state cannot dictate religious principles, marriage should not be dictated by religion. Marriage needs to be recognized as having two faces with many implications and benefits that all couples should be entitled to.

Dr. Jo Ellen Jacobs

ABSTRACT

Harriet Taylor Mill (1807-1858) was a remarkable and intelligent woman who engaged in an intimate intellectual relationship with John Stuart Mill, co-authoring articles, chapters, and even whole books with him in the mid-1800's while married to John Taylor. Harriet had two sons and a daughter named Helen. During Helen Taylor's stage career, Harriet frequently corresponded with her daughter; based on my transcription of the 1856-1858 letters, a fresh analysis of Harriet and Helen's mother-daughter relationship can be explored. In the last century, Harriet was frequently the target of criticism grounded in patriarchal bias; however, modern psychologists and sociologists studying mother-daughter relationships have identified these patriarchal biases in order to attempt to overcome them. I apply theories of mother-daughter relationships to the correspondence between Helen and Harriet to determine whether Harriet truly deserved the criticism of being a "bad mother." Moreover, I answer the question: Was Helen able to assert her independence during her theatre years free from Harriet? Although Harriet was far from an ideal mother, her correspondence with Helen supports the conclusion that Harriet has been unfairly portrayed in critical analyses; she and her daughter did eventually unite in a truly liberated mother-daughter relationship, characterized by interdependence and the desire for one another's happiness.

BACKGROUND

Over the last century, Harriet Taylor Mill has largely been criticized or simply ignored by scholars who are only now beginning to understand her as an important collaborator in the work labeled as John Stuart Mill's as well as a source of academic interest. For instance, not only is her unique relationship with the two men in her life both interesting and controversial, but the correspondence between Harriet and her daughter, Helen Taylor, can also illuminate a study of their mother-daughter relationship during the Victorian Era. However, a biographical foundation is necessary for this study of Harriet and Helen. In effect, if a person believes that humans' actions, relationships, and decisions are affected by their environment and life experience, then general knowledge of the life of the Taylor/Mill family is invaluable as a precursor to the evaluation of Harriet Taylor Mill and Helen Taylor's mother-daughter relationship.

Harriet Hardy was born on October 8, 1807 to Dr. Thomas Hardy and Harriet (Hurst) Hardy (Mazlish 291). Most scholars agree that in 1826, Harriet married John Taylor after the arrangement was made by her father; Harriet was 18 years old at the time, whereas John Taylor was 29. However, even Carlyle, a friend of the Taylor family, called John "an innocent, *dull* good man" (qtd. in Kamm 31 - Italics mine). In truth, Harriet "had an earnest, inquiring mind, sensitive artistic and aesthetic tastes to which he could not respond" (Kamm 32). Hence, although Harriet and John truly loved each other, Harriet soon became disillusioned with her life as wife and mother of two sons, Herbert and Algernon.

Consequently, William Johnson Fox, a friend of the family, arranged for a meeting between John Stuart Mill and Harriet Taylor when she was pregnant with Helen, her third child and only daughter. After meeting John Stuart Mill, her relationship with both Johns became purely platonic for the remainder of her life. Divorces were unobtainable, but she did have the option of separation. John Taylor allowed Harriet to leave with Helen, supporting her existence in a house apart from him and enabling the continuance of Harriet's intellectual relationship with John Stuart Mill. Harriet married John Stuart Mill in 1851, approximately two years after John Taylor's death.

Although very little has been written about this remarkable woman, she published poetry, reviews, articles, and pamphlets and co-authored newspaper articles, chapters, and perhaps whole books with John Stuart Mill in the mid-1800's. Throughout Harriet's separation from John Taylor and marriage to John Stuart Mill, Helen had been her constant companion, whereas Harriet's two sons had lived primarily with their father. While in their twenties, Helen and Algernon (her second son called "Hadji") lived with Harriet Taylor Mill (HTM) and John Stuart Mill (JSM) for awhile in Blackheath Park until Helen pursued an acting career, accompanied in her travels by Hadji. At the age of fifty, after having married JSM only seven years before, Harriet died of consumption in 1858. After Harriet's death, Helen retired from the stage and returned to JSM, virtually taking over Harriet's role in JSM's life.

Although a skeleton summary of Harriet's life can be constructed with little difficulty, even Hayek, a scholar who has extensively studied HTM and JSM, concedes that "if our main aim were to reconstruct a full-scale picture of her person that task would indeed be impossible" (15). Yet, scholars have frequently criticized Harriet's actions and temperament with relation to various members of her family. For instance, critics describe Harriet as domineering, narcissistic, masochistic, spoilt, and egotistical (Pappe 28; Packe 327; Mazlish 311-2). Like Harriet's relationship with JSM, John Taylor, and her sons (Herbert and Hadji), her relationship with Helen has also been scorned, thereby degrading Harriet's mothering skills as well as her mother-daughter relationship, and labeling Harriet as egotistical, snobbish, selfish, and overbearing.

Obviously, Harriet has never been respected for her mothering skills/qualities. Scholars living 100 years after Harriet know very little about her relationship with her two sons. Granted, critics know she separated from her husband and left her two small sons mostly to his care. Nonetheless, this small piece of evidence is an inadequate foundation to base an argument that Harriet was an incompetent mother, solely responsible for her sons' failure. Furthermore, Harriet's mothering skills have not been examined thoroughly in terms of her relationship with her third child Helen. Primary source information exists in the form of letters between Helen and herself upon which an educated analysis can be made regarding Harriet's mothering abilities with regard to her daughter. I have transcribed the letters between Harriet and Helen written between 1856 and 1858 during Helen's years in the theatre. Although much of their discourse may seem mundane, the way in which the two relate to each other conveys much about their relationship.

CONCLUSIONS

One question must be addressed before approaching the theoretical issue of Harriet's mothering skills: Are there biases present in past critical analyses that might explain why Harriet has been so criticized?

A scholar researching Harriet Taylor Mill may feel that Harriet has been criticized excessively by some scholars with a sexism grounded in a patriarchal society. The work of Vivien Nice can show how patriarchal trends have led to the "mother-bashing" that Harriet has undergone and supply the evidence needed to support the charge that previous critics' assumptions are less than fair.

Nice claims that Freud as well as other "misogynist psychoanalytic theory" is a modern "remything" of the mother-daughter relationship (7). Freud's influence on the analysis of female relationships is not merely the impression of Nice. For example, Caplan also sees a problem with Freud's interpretation of mothers and daughters: "Since the time of Freud, who suggested that how people interact with women is heavily influenced by their childhood experiences with their mothers, little has been written from the standpoint of individual and interpersonal psychology about women's conflicts with other women" (v-vi). Freud prevented a complete analysis of the relationship between mothers and their adult sons and daughters because he focused on the relationship between mothers and their *small* children.

Nice discusses the distortions that result from the "remything" of mother-daughter relationships. Basically, to "remyth" is to alter or change previously existing and accepted myths, so as to convey new morals and beliefs. Although we cannot fully overcome cultural "remything," an acknowledgment of these biases will allow a more objective analysis.

We must carefully be aware of the Freudian bias when asking: Was Helen adequately able to assert her independence free from Harriet during her theatre years? and Did Harriet respond as a "good mother" should to Helen's choice of the stage as a career?

First of all, when deciding whether Harriet was a "good mother," it is important to note that an ideal mother is not only impossible to define, but also impossible to embody in reality. Caplan (vi), Nice (36), and Friday (39) agree that a problem arises when one expects a mother to be perfect and disregards her humanity. This realization about the "human-ness" of mothers is essential to the study of mothers in any era. Before passing judgment on Harriet, we must recognize her as an emotional human being with a set of experiences that no one will ever really be able to fully understand. In addition, every relationship is like a living, breathing organism.

In effect, one must address whether Harriet fostered or discouraged Helen's assertion of independence. Did Harriet encourage Helen to be overly dependent on her? Given the current state of psychological understanding, independence is seen as a healthy progression for young adults. However, did Helen's closeness to her mother throughout her life make Helen overly dependent on Harriet and unable to assert her independence? Many psychologists claim that any inability on the part of the child to disassociate from her mother stems from their relationship when the child was an infant. Virtually no information can be verified regarding Harriet and Helen's interaction when Helen was an infant. We simply know that they were inseparable throughout much of Helen's early life. Some psychologists see the later inability to disassociate completely, resulting in dependence, as immature and dangerous, although Nice recognizes that "We are using here concepts loaded with value judgments - dependency is bad (and female), independence is good (and male)" (48). In fact, only the Western culture views dependency as immature, bad, feminine, and psychologically damaging; Eastern cultures do not equate independence with maturity. The way in which Americans value dependence and independence is culturally and gender defined. Cohler and Grunebaum's analysis reflects these stereotypical gender roles; with regard to mother-daughter relationships, they say that "While childrearing and culture combine to foster a relationship between two and three generations of women within the family who feel a sense of closeness and lack of individuation not generally found among men and their fathers, this continuing closeness is not necessarily a source of psychic pain" (25). In effect, closeness is acceptable and can be helpful rather than painful. Yet, the phrases "lack of individuation" and "dependency" are used freely, attaching value judgments as well. Where do Helen and Harriet fit into this dependency spectrum?

Helen was obviously the child most dependent on Harriet after spending most of her life in a close relationship with her. Packe interprets them as "so emotionally interlocked that they might well have been twins" (384). Moreover, most scholars characterize Harriet as Eugene August does: "strong-willed, intelligent, difficult to please" (August 134). Neither Packe nor August have substantial foundation based on the primary source for their arguments. However, if August has characterized Harriet correctly, she does not seem to be someone from which it is easy to assert independence. Based on my recent transcription and evaluation of the letters, Harriet and Helen's relationship falls into a category between dependence and independence, *inter*dependence. Nice claims that the word "interdependence" fits much better into an analysis of mother-daughter relationships:

> Daughters are seen as dependent on mothers: if the daughter 'fails to separate' from her mother she will fail to develop as an adult, autonomy being equated with separation from the mother. Later in life mothers are seen as becoming dependent on their daughters. These interpretations leave no room for positive images of connectedness, interdependency and support between women and between mothers and daughters. The language, concepts and theories of patriarchy seek to erect barriers between women, and in that first female relationship between a mother and her daughter. (9)

A reexamination of the purpose and function of dependency may reveal that dependency *may* have a place in relationships as long as neither party is hurt. Moreover, Nice's theory of *interdependence* (which successfully avoids the value judgments attached to the words "dependence" and "independence") best encompasses the mother-daughter relationship of Harriet and Helen. Interdependence within their relationship is the balance between the competing needs of independence and security; this balance is different for every mother and daughter pair. When inspecting Helen and Harriet's relationship, one must remember that interdependence is not only acceptable in healthy relationships, but also that the disassociative process is not a process that occurs suddenly. "Symbiosis and the early beginnings of separation do not proceed on one long, smooth, upwardly inclined plane. There are ups and downs, of course" (Friday 38). In this way, individuals that were previously dependent on one another will not be able to achieve and assert independence overnight, rather a process of "pulling" away with independence as well as "pushing" and reverting back into dependence will occur before an equilibrium of interdependence can occur. Likewise, Helen leaves home for the first time when she pursues a career in the theatre, only to revert back into a dependent relationship with her mother at the outset. However, although Helen and Harriet seem to be in this "pulling and pushing" stage when Helen initially leaves home, they seem to progress into an interdependence equilibrium after the first crucial months. Therefore, the key question is: Who was holding on? In effect, "Do mothers keep daughters close, while daughters strive to move away? Or do they push their daughters away whilst the daughter attempts to remain close?" (Nice 58).

Perhaps a modern analogy will shed light upon Helen and Harriet's dependent then interdependent relationship, that of a college freshman leaving home for the first time. Like Harriet, the freshman (depending on the extent of her reliance on her parents) experiences new surroundings that seem to thrust independence upon her. The result, as it is in the case of Helen, is homesickness and a kind of search for the safe, dependent state of home. Letter six of Helen to Harriet illustrates how work is the only way to ease the homesickness which Helen feels: "Being away makes me feel if possible more than ever how precious you are to me. . . . I have to busy

myself with learning and working incessantly for every minute I am not hard at work I begin to cry. . . . write me plenty when you can and only a word or two when you are tired. Good bye my precious one, although I cannot bear to stop." Indeed, Helen is still very reliant on Harriet and seeks to emotionally unite with home and her mother so as to fight off unpleasantness. In addition, like a college freshman, Helen wants to return home or arrange for her mother to meet her before she has given her new lifestyle a chance. In answer to this proposition, Harriet clearly shows that she is open to Helen's assertion of independence and her new life apart from her mother: "About what you say about coming home dearest girl it does not seem desirable to run home just for a short time and leave again directly - it would be better to come when you can stay a good time" (11). Obviously, Harriet would probably love for Helen to return home at this point, but perhaps she knows that it would be extremely difficult for Helen to go back to her life in the theatre after a short time at home. With regard to the difficult task of separation and individuation, the author of Linked Lives claims that "For most of the daughters, it is the stability of their mothers' attachment to them that allows them to go through the process of separation and develop a sense of independence" (Fischer 24). Harriet's answer to Helen parallels that of the parents of an extremely homesick child: she should not be encouraged to return home until she is comfortable with school or the second parting will be even more difficult. Although Helen reiterates her desire to come home in letter 30, Harriet remains firm in letter 33 that Helen is better off where she is. In fact, by the middle of December and throughout January, Helen's homesickness has obviously subsided and her dependence on Harriet has lessened as she begins to talk more and more about the affairs of the theatre and seems less preoccupied with home. Therefore, the letters reflect a subtle transition from dependence to more of an interdependence.

The next question that may arise is whether Harriet was too overbearing, domineering, and even passive-aggressive in her advice, or whether Harriet did, in fact, respect Helen's decisions. For example, Harriet tells Helen how often to write to her. Harriet says, "Write to me here dear twice a week" (7). Yet, although her directions initially appear to be demanding, the reader soon notices that Helen writes even more frequently than this; Harriet wasn't being demanding, but rather, was trying to *limit* Helen's writing to save her the time: "I have already said write here as often as you like, I said twice a week to save you trouble" (27). However, Harriet frequently advises Helen on other issues as well. Nonetheless, most frequently, it is *Helen* who requests the advice from Harriet. Helen seems to be asking for Harriet's approval for her decisions regarding dress and theatre parts in letters 20, 21, and 22. Helen assures Harriet, "I shall quite understand that you are not persuading me to anything but giving me your mere judgement" (21). Mostly, Helen seems to try to justify her own decisions with the advice of her mother whom she deems to be more experienced than herself in worldly issues: "You are the best judge of this and I will do whatever you tell me, but it seems to me so" (22). Harriet appears to realize her limitations in giving advice to Helen and tells her "I will answer all your questions dearest girl as well as I can: but at this distance it is not always easy to judge about details" (7). Yet, later in letter seven, Harriet makes an admirable effort to attempt to "kick her fledgling out of the nest" (to put it in colloquial terms):

> I have you see dear gone thro' your letter answering each question as well as I can but I feel the waiting very badly. I do not wish to say anything about my feelings or state because I wish you to be wholly uninfluenced by me in all your future proceedings. I would rather die than go through again your reproaches for spoiling your life. Whatever happens let your mode of life be your own free choice henceforth.

This passage seems to imply that Helen has previously scorned Harriet's intrusions and advice; in addition, Harriet sounds a bit defensive while still acknowledging that Helen needs to make the decisions for her own life. Indeed, by January, Helen has accepted responsibility for her own decision (regardless of the reason) and tells her mother, "I cannot ask your advice about things because of not getting the answer for so many days" (72).

In conclusion, the correspondence between Harriet Taylor Mill and her daughter Helen Taylor, two very important historical figures in Victorian England, provides an interesting insight into the complexity of mother-daughter relationships and interaction. Indeed, "The relationship between adult women and their own mothers is perhaps the most complex and emotionally charged of all the relationships within the family" (Cohler 24). Moreover, it may be arguable that the only person who can begin to understand and comprehend the mother-daughter relationship *is* a daughter; a daughter who has, in turn, become a mother is the only person who can *fully* understand the dynamics of this particular relationship. Nonetheless, psychological analyses of mother-daughter relationships can aid the study of the correspondence between Helen and Harriet, neither of whom is the *ideal* daughter or mother. Karen Payne, the author of a book composed of correspondence between mothers and daughters, ended her introduction by stating:

> Within each mother-daughter relationship there is a unique conflict between wanting the richest possible fulfillment for each other, longing to preserve security and needing to break the mutual dependence. Real liberation for women will perhaps only come when mothers and daughters can say wholeheartedly to each other (as Kate does in Chapter Four): I keep on wanting everything, and I want you to want that too. (xvi)

Are Harriet and Helen truly liberated within their mother-daughter relationship? In other words, do Helen and Harriet truly wish happiness for each other? They could only have achieved that state if Harriet allowed Helen to adequately assert her independence and pursue her theatre career so that they could relate in an interdependent state. After reading the letters from November 1856 to January 1857, Helen and Harriet both appear to genuinely desire each other's happiness. For instance, Harriet tells Helen, "The only way I can share in your enjoyment as you say dear is to wish you all possible happiness which I do with all my heart and to be pleased to hear of your pleasure" (11). Likewise, Helen tells her mother, "Remember dear there is nothing you can tell me which interests me so much as how you are" (21). Granted, at times they both appear to be selfish and even passive-aggressive, but their behavior is reasonable as they are not "martyrs" but rather real people dealing with a transition from a previously dependent state. Yet, Harriet's relationships with John Stuart Mill, John Taylor, Herbert Taylor, Algernon "Hadji" Taylor, and Helen Taylor have always been criticized. In particular, most scholars of Mill have denounced Harriet's mothering skills. Modern scholars are beginning to discern and overcome some of the "mother-bashing" biases of the twentieth century thus making it easier to portray and justify the true nature of Harriet's relationship with her daughter Helen. These new theoretical models of mother-daughter relationships, modern Victorian scholarship, combined with the newly transcribed letters between Harriet and Helen, reveal not a perfect mother or daughter, but rather two individuals willing to struggle to define an interdependent relationship which balanced the need for both independence and security for each.

ABSTRACT

This essay explores similar religious perspectives in the work of American philosopher John Dewey and Russian novelist Fyodor Dostoevsky. Dostoevsky (1821-1881) was deeply concerned with the problems of Western rationalism, and particularly in *The Brothers Karamazov*, offers a penetrating critique of the Western tradition. Dostoevsky's Christian perspective is comparable to Dewey's pragmatic freedom. Dewey (1859-1952) argued that the Western desire for eternal truth and antecedent reality should yield before the greater goods of freedom and moral value. In Dostoevsky's polyphonic novels and Dewey's community of values lies an invigoration of moral and social thought.

INTRODUCTION

This essay offers a Deweyan account of Fyodor Dostoevsky's Christianity. I contend that the pragmatic, democratic philosophy of John Dewey is relevant to Dostoevsky's Christianity as seen through his central characters. No one denies that Dostoevsky belongs in a discussion of great literary artists; I would like to find a place for him in the history of ideas. Following Dewey's suggestion that there is no sharp, categorical division between the great novelist and the great thinker, the artist and the philosopher, I deny that the distinction holds in Dostoevsky's case. By placing his artistic development of Christian life in pragmatic perspective, I see Dostoevsky as a skillful craftsman of ideas, ideas that dramatically challenge the Western intellectual tradition. Dostoevsky's Christianity points toward and lends itself to a Deweyan religious perspective. By seeing Dostoevsky to express a pragmatic Christianity, I concur with Dewey that the artist is often best-qualified to explain the actual workings of an idea or belief, in this case, Dewey's own idea. Dostoevsky the artist and Dewey the philosopher together show us the content of pragmatic Christianity. I find a common critical perspective in the work of Dostoevsky and Dewey in my discussion of Dostoevsky's "Rebellion" and "The Grand Inquisitor" chapters in *The Brothers Karamazov*. I choose these passages because they demonstrate that Dostoevsky rejects classic Western Catholicism. Moreover, he makes an explicit connection between classical Catholicism and the philosophies of utilitarianism and socialism. I compare this connection with connection Dewey sees between the philosophies of rationalism and empiricism; he sees them united historically in a quest for certainty. Their mutual rejection of these philosophies legitimates a comparison of their positive arguments. In *The Brothers Karamazov*, Dostoevsky responds to the arguments of Ivan Karamazov by describing the Christian lifestyle of Ivan's brother Alyosha, and the teachings of Alyosha's mentor, Father Zosima. Dewey's religious faith is faith in a moral ideal, an ideal transcendent of one's culture and tradition, and realized in practice and imagination(48). I find a basic harmony between the two positions.

Since intelligence in operation in operation is the only way to secure a better world, Dewey asks that we put faith in our capability to overcome obstacles to that better world: "Religious faith which attaches itself to the possibilities of nature and associated living would with its devotion to the ideal, manifest piety toward the actual. It would not be querulous with respect to the defects and the hardships of the latter. Respect and esteem would be given to that which is the means of realization of possibilities, and to that in which the ideal is embodied if it ever finds embodiment"(*The Quest for Certainty*, 244). Dewey is arguing that in religious life, attention should fall on the method in operation("the means of realization of possibilities"), because the process of striving and achieving is the only way we can unite the actual with the ideal; *how* one achieves a religious end enables one to know what one's ideals are, and whether or not those ideals are worth pursuing.

Dostoevsky implicitly applies a similar evaluative criterion in his novels. Dostoevsky's characters speak of a "unifying idea" that shapes and orders their life. In the course of a character's development, the reader learns through the character's speech and action what that unifying idea is, and also whether that idea is viable in the face of unexpected events and moral conflicts that the character inevitably faces. Dostoevsky is a novelist of ideas, meaning simply that readers learn through the action and experience of the character, the content of an ordering principle, and whether or not this principle is adequate in the world of his novel. Thus, when critics speak of Ivan Karamazov as the embodiment of rationalism, they mean that through the actions and statements of Ivan, readers can discern a mode of action and embodiment of ideals that are consistent with what on calls "rationalism," Only through paying attention to the details of Ivan's life may the reader come to any conclusions about the value of his belief system. We must evaluate

Dostoevsky's *Christian* characters in the same way.

The comparison between Dostoevsky and Dewey is so far fruitful. but it also gives rise to important questions. How does Dostoevsky's Christianity differ from formal Western Christianity? Are Dewey's religious beliefs Christian? If so, how? Does Dostoevsky's Christianity have anything in common with Dewey's? What may we learn from this comparison? Dewey's religious faith is similar to Dostoevsky's Christianity. Obviously, Dewey's faith does not derive from the Russian Orthodox church, nor he is concerned with the Russian people. Neither does he respond specifically to the wrenching conflicts of the Slavophiles and Westernized socialists in the nineteenth century Russian life. More generally, however, Dewey *does* locate his religious faith in his traditions and in his community. In addition, his pragmatism is an explicit attempt to reconcile the protracted conflicts of religion and science. In *The Brothers Karamazov*, Dostoevsky describes a religious faith that is thoroughly a matter of practice. Ivan illustrates for us the danger of a life committed to intellectual doctrines, while the teachings of Zosima and the life of Alyosha show us the richness of a "pragmatic," or practice-oriented, Christian faith. Dewey's faith is practice-oriented in a similar way, and any attempt to ground religious faith in something more than the power of possibility he sees as superfluous, perhaps detrimental: "It is admitted that the objects of religion are ideal in contrast with our present state. What would be lost if it were admitted that they have authoritative claim upon conduct just because they are ideal?" (CF,41)

We must interpret Dewey's religious beliefs in light of his anti-reductive spirit of inclusiveness. He is committed to showing that moral faith is accessible not only to Christians but to scientists, plumbers and architects. dewey shows that people in a pluralistic community can be committed to common ideals, and that religious faith helps them realize their common ideals. Dewey defends detailed conceptions of the good life, of the right way of living, and of transcendent ideals people should pursue. Dewey's concept of faith as a mediator between the actual and the ideal allows one to be fully Christian and fully democratic and fully scientific, without reducing one to another. Thus, if Alyosha is taught in a Christian tradition, if he lives according to Christian precepts, and has faith in Christian ideals, then he is Christian, without ever having a view on the filioque doctrine or the cosmological proof or the Virgin Birth. This interpretation of Dostoevsky in light of Dewey's inclusive pragmatism is helpful.

IVAN AND THE GRAND INQUISITOR

Ivan Karamozov expresses ideas Dostoevsky felt most compelled to confront, because he offers a clear, strong, and forceful statement against Christianity. Ivan's arguments are not obviously flawed. He is a compelling figure, thoroughly versed in contemporary science and philosophy, yet deeply sensitive and humane. He cannot be dismissed either for being unrigorous or for being cold-hearted. Ivan Karamozov poses significant problems for formal Christianity.

Ivan argues that there is a fundamental contradiction between the intellectual doctrines of Christianity and Christ's moral teachings. He illustrates this fact with respect to the Catholic Church in "The Grand Inquisitor," and his own fate later in the novel is living evidence of it. The attempt by the Church to realize universal happiness on Earth culminates in the tyranny of the Inquisition, and Ivan's acceptance of the maxim, "If God does not exist, everything is permitted," leads him to complicity in his father's murder and eventual insanity.

Ivan believes it absurd and illogical that an infinitely powerful and beneficent Creator would permit human suffering, and if there is a hidden harmony in the cosmos, Ivan's conscience will not allow this harmony to explain away the terrible suffering endured by the children: "With my earthly, Euclidean understanding, all I know is that there is suffering and none are guilty; that cause follows effect, simply and directly; that everything flows and finds its level.... But then there are the children and what am I to do about them? Listen! If all must suffer to pay for eternal harmony, what have the children to do with it? It's beyond my comprehension why they should suffer and why they should have to pay for the harmony.... Too high a price is asked for harmony; it's beyond our means to pay so much.... It's not god that I don't accept, Alyosha, only I must respectfully return the ticket to Him" (238). Human suffering, Ivan says, cannot be explained away, ignored, rationalized, or reconciled with some higher system. Any acceptance of Christian doctrines about God's infinite wisdom and benevolence clashes with his desire for earthly justice. Ivan's speech confronts Alyosha with an unusual form of the problem of evil. Ivan passes over the apparent contradiction in a God whose perfection requires the suffering of innocents, and directly challenges Alyosha to *accept* God's world, appealing to Alyosha's conscience, rather than his logic: "Tell me yourself, I challenge you--answer. Imagine that you are creating a fabric of human destiny with the object of making men happy in the end, giving them peace and rest at last. Imagine that you are doing this but that it is essential and inevitable to torture to death only one tiny creature...in order to found that edifice on its unavenged tears. Would you consent to be the architect on those conditions? Tell me. Tell me the truth" (239).

Ivan's attack extends to Jesus Christ Himself in "The Grand Inquisitor" chapter. Christ came to make men free, the Inquisitor says, but the Church has worked for fifteen centuries to rid the world of this terrible gift. He contends that freedom is the source of men's greatest suffering, and Christ loved men less for allowing them their freedom. (241-243) The Grand

Inquisitor says of Christ: "'Thou wouldst go into the world, and art going with some promise of freedom which men in their simplicity and their natural unruliness cannot even understand which they fear and dread--for nothing has ever been more insupportable for a man and a human society than freedom.'" Freedom of conscience allows humankind the choice between good and evil, and men, the natural rebels that they are, time and again choose evil. The eternal harmony, when they will be united with God in perfect happiness, has eluded humankind. The Grand Inquisitor maintains, however, that in the three temptations of Satan in the wilderness Christ had the opportunity to act once and for all for the good of humankind. The Grand Inquisitor challenges Christ, in the same way Ivan challenged Alyosha, to consider whether or not He was right to allow humankind's suffering to continue: "Judge Thyself and see who was right--Thou or he who questioned Thee then?" In miracle, mystery and authority, Satan offered Christ the powers to realize eternal harmony at once. Christ could have eliminated the material, spiritual, intellectual, and political suffering of mankind, yet He refused to do so for the sake of human freedom: "Nothing is more seductive for man than his freedom of conscience, but nothing is a greater cause of suffering. And behold, instead of giving a firm foundation for setting the conscience of man at rest forever, Thou didst choose all that is exceptional, vague and puzzling." People have been left to exercise their own judgement and have seen their judgement overwhelmed by their freedom. People live in pain and suffering. If Christ is infinitely powerful, infinitely good, and infinitely knowing, then what excuse does he have for not eliminating man's freedom, or more to the point, what excuse do men have for accepting His excuse? Only by asserting His absolute dominion, and thus his omniscience, could men avoid chaos. Still, Christ refuses. (245-251).

Ivan and the Grand Inquisitor describe a God omniscient, omnibenevolent, and omnipotent, who creates a world that will be reconciled with Him in perfect harmony and universal happiness, a world in which suffering will disappear. Free conscience, however, challenges any happiness tomorrow which is built on suffering today. The Church intercedes, using the powers of miracle, mystery and authority to eliminate freedom of conscience, the chief obstacle to the realization of universal happiness and universal harmony. Ivan and the Grand Inquisitor have driven a wedge between Christ and doctrinal Christianity and have shown that any attempted union will be contradictory and fraudulent.

Christ is an enemy of any attempt to set once and for all *the* religious truth. He is an enemy of any Church that relies on upsetting the laws of nature, on a dogmatic interpretation of the mysteries of Scripture, or on asserting God's absolute dominion. Dostoevsky and Dewey stand with Christ against doctrinal Christianity. Nevertheless, we must still answer the Grand Inquisitor's charge that tyranny is a better and more humane path to happiness than freedom, and Ivan's charge that without doctrinal Christianity's omniscient and omnipotent God, there can be only chaos and nihilism--If God doesn't exist, everything is permitted. We must keep in mind these challenges as we turn to Dostoevsky's and Dewey's positive religious beliefs.

GROUNDWORK FOR A PRAGMATIC RESPONSE

Thus far, I have explored a common attitude of Dewey and Dostoevsky regarding conventional Christianity. The Grand Inquisitor, insofar as he attempts to assert a static, eternal harmony, establish protectorate of religious truth, and impose a world unity, is supporting a doctrinal religion, but not the teachings of Christ. Dewey attacks doctrinal religion on several points. He objects, first of all, to any moral philosophy, whether Christianity, socialism, or utilitarianism, that converts faith in a moral or religious ideal into a question of assent to intellectual doctrines. "There is a difference between belief that is a conviction that some end should be supreme over conduct, and belief that some object exists as a truth for the intellect" (CF 20). Moral faith "conviction that some end should be supreme over conduct," is entirely a practical concern. As such, it asks that we devote ourselves to that end, that we struggle in the face of adversity. "Such moral faith," says Dewey, "is not easy." Unfortunately, instead of devoting their energies to the difficult task of living for a moral ideal, men like Ivan too often become embroiled in an intellectual debate. When Ivan sees clearly that the eternal harmony does not exist "in the nature of things," he abandons the struggle for a better world altogether, and abandons hope as well. Dewey's comment about followers of doctrinal religions applies to Ivan in this case: "(R)eligious devotees rarely stop to notice that what lies at the base of recurrent conflicts with scientific beliefs is not this or that doctrine so much as it is an alliance with philosophical schemes which that the reality and power of whatever is excellent and worthy of supreme devotion, depends upon proof of *its antecedent existence*, so that the ideal of perfection *loses its claim over us* unless it can be demonstrated to exist in the sense in which the sun and stars exist"(*The Quest for Certainty*, 242).

The Grand Inquisitor would have loved humanity better had he devoted himself to ways in which human happiness can actually flourish; namely in a commitment to freedom of conscience, in a commitment to universal brotherhood, in a commitment to the moral capacities of his fellow man. Instead, the Inquisitor believes that a moral ideal can only be secured in dramatic gestures, once and for all, and he ends covered in the blood of innocents. The suggestion here is that the Inquisitors' tyrannical solidarity is as bad as Ivan's nihilistic individualism. Dostoevsky and Dewey have less faith in dramatic attempts to obtain absolute certainty, and more faith in the abilities of human intelligence and human freedom to forge a middle path between two extremes. The suffering in the world is not something to be taken

for granted or explained away. Rather, "The position of natural intelligence is that there is a mixture of good and evil, and that reconstruction *in the direction* of the good which is indicated by ideal ends, must take place, if at all, through continued cooperative effort" (CF, 47). In other words, the life worth pursuing will embrace the resources necessary for creating a better world.

Dewey is at once a democrat and a Christian. Dewey's ideal of democracy captures his moral and religious commitments deeply and comprehensively. Democracy encompasses the value of egalitarianism, instrumentalism, individuality, community--for Dewey, the moral and religious significance of democracy is unlimited. Pragmatic Christianity means nothing more nor less than following Christ; that is, it means commitment to the moral and spiritual ideals that Christ taught. The commitments to realizing individual freedom, to breaking of oppressive social bonds, to challenging and respecting the established beliefs of the community, to considering the views of others, are ideals held by Jesus Christ and Dewey *in common*. In this sense, the democratic life is also the Christian life; Dewey's religious faith is inseparable from his faith in democracy and from his faith in the possibilities of a better world: "The struggle for democracy has to be maintained on as many fronts as culture has aspects: political, economic, international, educational, scientific and artistic, religious. The fact that we now have to accomplish of set purpose what in an earlier period was more or less a gift of grace renders the problem *a moral one* to be worked out *on moral grounds*" (*Freedom and Culture*, 186). If in the Grand Inquisitor we see as clearly as anywhere the attempt to "fix religious truth once for all," then the lives of Zosima and Alyosha Karamazov provide us a prescient glimpse of "the real Christianity" continuing to grow "in wider and freer channels" ("Democracy and Christianity," 5).

FROM ZOSIMA TO ALYOSHA

Zosima and Alyosha embody the Christian ideal in practice. Their lives also demonstrate the movement of the Christian ideal through time. Father Zosima comes to Christianity through the living example of his older brother, Markel. After Markel dies, Zosima passes his experiences and teachings on to Alyosha, who, at Zosima's death, provides a living example to those around him. Although Alyosha faces an undetermined and uncertain world at the novel's close, he is firmly committed to his moral ideal, and is prepared to pass his beliefs on to the next generation of life. This picture is deeply symbolic. In it we glimpse the practical concept of Christian teachings, the relationship of a moral ideal to the actual world, and the relationship of Christians to the world in which they live. If pragmatic Christianity means anything, it means being practically committed to this moral ideal. It certainly does not entail any particular intellectual doctrine. Dostoevsky critic Roger B. Anderson states, "[Doctrinal] Christianity teaches people to seek the meaning of their lives and the world through specific theological dogmas (such as the Trinity, the virgin birth, grace, salvation, the Resurrection, etc.) But Zosima's highest valuation is the linkage to divine wisdom in all aspects of daily life. He talks of no mediating authority--canonical or institutional--as necessary for directing human reach for the transcendent"(124). Dewey contends that the mediation--the "linkage"--between our moral ideal and our actuality is made possible in our moral faith, and moral faith exists in all of our beliefs and actions. Moreover, our conviction that a moral ideal should shape our actions and our character must be strong enough to overcome practical frustrations. Similarly, Dostoevsky writes, "To transform the world, to recreate it afresh, men must turn into another path psychologically. Until you have become really, in actual fact, a brother to everyone, brotherhood will not come to pass. No sort of scientific teaching, no kind of common interest, will ever teach men to share property and privileges with equal consideration for all. [U]ntil then, we must keep the banner flying... that the great idea may not die"(BK,293). The spiritual ideal's existence depends entirely on our willingness to struggle on its behalf. Pragmatic Christians realize that their everyday actions and beliefs impact the ultimate survival of their moral ideals, a fact acknowledged by Dostoevsky in the words of Ippolit Turentiev, a character from *The Idiot*: "In scattering the seed, scattering you 'charity,' your kind deeds, you are giving away, in one form or another, part of your personality, and taking into yourself part of another; you are in mutual communion with one another, a little more attention and you will be rewarded with the knowledge of the most unexpected discoveries. All your thoughts, all the seeds scattered by you, perhaps forgotten by you, will grow up and take form. And how can you tell what part you may have in future determination of the destinies of humanity? If this knowledge and a whole lifetime of this work should make you at last able to sow some mighty seed, to bequeath the world some mighty thought, then...[as his voice trails off]"(392).

Although death comes to individual Christians, the Christian ideal lives on in the lives of others. Zosima draws his religious faith from the consuming and transcendent power of his relationship with the world--with the rhythms of nature, with those in his community, with those that came before, and with those yet to come. Thus, people who interpret the rapid decomposition of Zosima's body after his death misunderstand his Christian message. The monastery expects miracles at his death, and finding none, deem his message illegitimate and blasphemous. However, "Those hoping for miracles would have nature's rhythm subordinated to their own static measurements of predictability and proof. They deem unseemly the very heart of Zosima's vision of faith--the decomposition of one life from which new forms in the next generation might grow.... Zosima insists that people gain spiritual faith by yielding their individuality to the sacred processes of nature, not by demanding that nature gear down to their personal systems of temporal expectations" (Anderson, 128).

When Alyosha is struggling to overcome doubts and questions about his faith in the wake of Zosima's death, he has a mystical religious experience which firmly renews his moral faith. In it, Zosima appears and tells Alyosha, "Do no fear Him. He is terrible in his greatness, awful in His sublimity, but infinitely merciful. He has made himself unto us from love and rejoices with us. He is expecting new guests, He is calling new ones forever and ever" (BK, 348). Alyosha interprets this vision to mean that although Christ was destined to suffer terribly and die a painful death, he participated fully in life and His message continues to live. Alyosha's vision inspires in him a transcendent, mystical unification with the universe. He has been, as Dewey puts it, "conquered and vanquished" by the power of the Christian ideal (CF,20): "[W]ith every instant he felt clearly and, as it were, tangibly, that something firm and unshakable as that vault of heaven had entered his soul. It was as though some idea had seized the sovereignty of his mind--and it was for all his life and forever and ever" (BK, 349).

PRAGMATIC RELIGIOUS FAITH

Pragmatic religious faith centers on here and now. In Zosima's teachings, there is no speculation of the afterlife, no discussion of a supernatural heaven. Although he is a monk, Zosima does not cloister himself away and wait for the secular world to pass. On the contrary, he instructs Alyosha and his followers to engage the secular world. Zosima wishes anything but that Christians be removed from either the natural world or their membership in their moral community. When discussing pragmatic religious faith, considerations of our natural environment and our moral community are fundamental. Dewey argues that moral and religious ideals cannot be viewed apart from the context in which they are imagined and realized; our environment forms "the matrix within which our ideal aspirations are born and bred" (CF, 85). Faith, which serves as mediator between the actual and ideal, can neglect neither. Without religious faith, Dostoevsky's characters fail in their quest for inner harmony. Andrew MacAndrew tells us that, "Without that unifying idea, there can be no harmony between man and the world around him; nor, whatever he may do, can he have any harmony, which Dostoevsky calls 'beauty' (blagoobrazie). And without it, a man is only a haphazard sequence of unsynthesized impulses and reactions, instinctively searching for a substitute unifying principle. That substitute will most likely be an idol, a false god, a delusion of faith, or perhaps an obsessive passion. But whatever it is, the result will be a whole built around a false principle, a forcibly synthesized and therefore ugly and unstable identity" (xxii). We witness the contrast in *The Brothers Karamozov* between the nihilistic and tyrannical moral lives of Ivan and The Grand Inquisitor and the healthy vital dispositions of Alyosha and Father Zosima. Dostoevsky's novels are filled with moral traps and dilemmas and very few characters grasp moral beauty. Those that do, Dostoevsky's Christians, put their faith in the rich moral possibilities of the Russian earth and moral community, rather than contradictory and unnatural doctrines.

Dewey holds that religious faith "that is devoted to creation of a future, instead of staking itself on propositions about the past, is invincible" (*The Quest for Certainty*, 243). Dostoevsky silently concurs, in the words of Zosima to Alyosha: "You are working for the whole, you are acting for the future. Seek no reward, for great is your reward on this earth: the spiritual joy which is only vouchsafed to the righteous" (BK, 312). If the moral prophets are always poets, (*Art as Experience*, 350), then in *The Brothers Karamozov*, Dostoevsky is the moral prophet of Dewey's pragmatic religious faith.

Epistemological Conditions:
How PlatoAnticipates Gettier

> *"European philosophical tradition... consists of a series of footnotes to Plato"*
> (Whitehead)

In 1963 Edmund Gettier published an article entitled, Is Justified True Belief Knowledge? With two very concise counterexamples, Gettier brilliantly exposed the shortcomings of the accepted definition of knowledge. This definition had been held since the philosophy of Plato. The accepted epistemological conditions stated that knowledge can be owned, if and only if, the thinker has a belief, which is justifiable and, true. Plato's dialectical Theaetetus is excellent example of an ancient piece of philosophical inquiry into epistemology, and adheres to the common Socratic dialectical method of teaching. It is Plato's record of a conversion between Socrates and the young Theaetetus. Plato leads the reader through the problems facing our ability to make claims of truth. Although Plato is credited with the inception of the long held epistemological conditions, we will see that he recognized it's incompleteness. Nevertheless, the justified true belief criteria had served as the sufficient condition for a knowledge claim throughout the history of epistemology. I will set out here to explicate how Plato's dialogue anticipated Gettier's observations. The initial ideas that obtain concrete relevance in Gettier's article can be found in the Theaetetus. Gettier's analytic style of two brief but crucial counterexamples forever changed our view of an acceptable knowledge condition.

Justification is critical to the traditional definition of knowledge within any theory of truth. For example we may, by chance, believe an idea that is true, while having no justification for doing so. For example, before the discovery of microbes, people believed that the coughing, feverish and delirious person was suffering a fate caused by an angry God unleashing unspeakable demons upon the impious. Those who believed (without justification) in tiny corporeal creatures invading our body cannot be said to have had knowledge of microbiology. Justification has historically demonstrated the necessary evidence for believing the proposition. The reason that today we hold microbiology to be an example of true knowledge is that scientists convincingly verified their belief in believing in microscopic organisms.

We can observe this appeal to justification in Plato's Theaetetus where he indicates in Sec. 201 that true belief is influenced by persuasion. True knowledge, on the contrary, is produced through instruction and is always accompanied by an accurate account (Cornford 141). A famous historian of philosophy, Frederick Copleston, adds that Theaetetus suggests the addition of an "'account' of an explanation would convert true belief into knowledge" (147).

By an 'account' Socrates takes Theaetetus to mean one of three things: verbal expression, the reduction into elemental parts, or the noting of differentiation. Socrates analyzes each of these possible interpretations. A true belief can be expressed with words as easily as knowledge can be expressed. This meaning of 'account' as mere articulation adds nothing to our analysis. Reducing the true belief to its knowable parts also does little to solve our dilemma. The pure memorization of the steps to a geometric proof does not equate with a mathematician's knowledge of the theory. The mere reduction of a truth claim to its parts does not transform it into knowledge. Thirdly, Socrates notes that if a true belief of some proposition can be made into knowledge by the addition of a differentiating characteristic we engage in circularity. The problem is that if my true belief did not *already* contain this differentiating characteristic it would not constitute a distinct true belief (Copleston 147-8).

Continuing in the Theaetetus, the question of how a person can form false opinion is raised. Epistemologists typically confine their work to the beliefs that must necessarily be either true or false. Knowledge, by definition, is limited to the set of true beliefs only. Socrates and Theaetetus limit their discussion to those things that exist. It is further agreed, by the characters Socrates and Theaetetus, that non-existence equates with falsehood. Thoughts of non-existent things are not thoughts at all. With this in mind, both Socrates and Theaetetus concur that false opinion results when, "any one thinks one thing as another..."(Plato 53). This construct, however, contains flaws, as Plato demonstrates. We do not confuse one correct idea for another correct idea when reasoning. We do not believe the "unjust just." We also do not "persuade [ourselves] that an ox is a horse, or that two are one" (Plato 53).

Socrates rules out the following possible cases of confusion: (1) One knows both things (A and B) but neither sees nor perceives A or B, therefore he cannot mistake A for B, (2) one knows A but not B (or vice versa), but perceives neither, and so cannot confuse the two, or finally (3) one does not know, and does not perceive A and B, obviously no confusion can occur of such non-existent thoughts. For in 193 c of the dialogue, the analogy of the foot in the wrong shoe is used to explain this error. The true knowledge exists, in keeping with Plato's representational theory of the world, on a waxen tablet analogous to the soul. Error occurs only when the true impression on the tablet is matched up with the wrong perception.

> Socrates. *"When, therefore, perception is present to one of the seals or impressions but not to the other, and the mind fits the seal of the absent perception on the one which is present, in any case of this sort the mind is deceived..."*(Plato 55)

Turning our attention to the 1963 essay by Edmund Gettier, the author begins his essay with the logical schema of what has previously constituted the necessary and sufficient conditions for knowing. His first form is, not coincidentally, footnoted to Plato's Theaetetus:

S knows that P
IFF
(i) *P is true*
(ii) *S believes that P, and*
(iii) *S is justified in believing that P.*
(Gettier 273)

BEST COPY AVAILABLE

A summary of the first counterexample is that Smith and Jones have applied for the same job. Smith has strong evidence for believing that Jones has ten coins in his pocket, and that Jones will get the job. Smith's evidence might be that he has on good advice that Jones will get the job, and Smith himself counted ten coins in Jones's pocket. The entailment of Smith's belief is that the person who will get the job has ten coins in his pocket. It turns out to be true that the person who gets the job has ten coins in his pocket, but that person is Smith and not Jones. Smith was unaware that he, too, had ten coins in his pocket. Therefore Smith was justified in believing that the person who would get the job had ten coins in his pocket, but did not *know* this to be true. Smith had true belief, and justification for it, but in fact did not possess knowledge (Gettier 273-74).

This first counterexample Gettier put forth is of the type of deception that takes place in one's mind as expounded above by Plato. The '*perception*' that the person who gets the job will have ten coins in his pocket is analogous to Gettier's "*is justified in believing that...*" The absent perception here is that Smith himself has ten coins in his pocket. As Gettier puts it, "...unknown to Smith, he himself has ten coins in his pocket." The falsification occurs in that the, "Mind fits the seal of the absent perception [Smith's own ten coins] on the one which is present [Jones's ten coins]." Smith has put the 'foot in the wrong shoe.

The second of Gettier's counterexample is a logical disjunction. In a disjunction (an A *or* B statement) the entire proposition is true if either A or B is true. The compound proposition; It is cold outside or it is sunny, is true if either (or both) it is cold *or* it is sunny. The second Gettier counterexample starts with the proposition, "Jones owns a Ford." Smith has strong evidence for believing the proposition, since he has always seen Jones driving the Ford and has even seen the title of ownership for the car. By disjunction, this statement, in combination with a statement about Brown's whereabouts, will be true if our first proposition (Jones owns a Ford) remains true. Whether Jones is in Boston, Barcelona, or Brest-Litovisk will not affect the truth condition of a disjunction that contains a true first premise. In this case, the truth value of Brown's location does not affect the compound proposition's truth.

As a demonstration of a false claim to knowledge the following scenario is enacted, Jones does not own a Ford, but Smith is in Barcelona. Following the above stated rules of a logical disjunction, this statement is clearly true. The second half of the compound proposition (Smith is in Barcelona) is true-- making the disjunction true. The epistemological problem is that Smith believed the statement and had justification for doing so (Jones owns a Ford). Smith, however, did not have knowledge of the statement since he believed it for the wrong reason (Gettier 274).

Gettier in clear analytical form has demonstrated the shortcomings of what had widely been held a universal definition of true knowledge. But, what is often overlooked is that Plato himself was aware that it was insufficient. In summarizing the dialogue with Theaetetus, Plato quotes Socrates as saying, "...how utterly foolish, when we are asking what is knowledge, that the reply should only be, right opinion with knowledge...knowledge is [not]...definition and explanation accompanying and added to true opinion" (63).

I believe that a philosopher asserting the strengths of the Socratic dialectical teaching method must reconsider the value of this method in the light of this comparison. Although Plato recognized that the definition, which Socrates and Theaetetus arrived at, was incomplete he apparently failed to convey this as well as the his modern philosophical counterpart. For the most part, only with the appearance of Gettier's article has this Pandora's box been reopened.

Socrates commends his young pupil, "But if, Theaetetus you should ever conceive afresh, you will be all the better for the present investigation." Perhaps anticipating Gettier he adds "you...will be too modest to fancy that you know what you do not know" (Plato 63). In the more than thirty years of reinvestigation into our study of epistemological necessary and sufficient conditions we are still left searching. As Plato admits, "These are the limits of my art" (63).

ADVERSITY AND SACRIFICES: THE EXAMINATION OF TWO LIVES

Faculty Advisor:

Harriette Pipes McAdoo, Ph.D.

Abstract

Adversity can develop character, and character enables those who have overcome adversity to make contributions to society. The focus of this study is based on two prominent individuals who have made contributions to scholarship and career. These individuals exemplified the translation of intentions into reality and sustained reality in making a difference to our society. The research methodology used in examining these two lives are prosopographical case studies and combinations of history and biography, beginning from the Summer of 1994 to the present. An interview with The New York Times was conducted on October 16, 1996 for an understanding of that newspaper's methodology as well as background information on the early public lives of these two individuals before they died. Anyone reading the history of these individuals will readily discover their focus on education and career. Each of them prevailed through adversity and sacrifices even when their intentions were scorned.

INTRODUCTION

I became interested in this study in the Summer of 1994 when University Distinguished Professor Harriette Pipes McAdoo supervised my work in the McNair Scholars program. Part of my assignment was to read The New York Times everyday to look for articles relating to teen pregnancy. One day, I could not find anything on that subject, so I turned to the obituary section of The New York Times and read the obituary of Felice Schwartz, that changed my life in two ways: first, the obituary took almost one page of The New York Times, and her live was detailed to the extend that I learned all I could possible know about her work, attitude and endurance. Secondly, Schwartz overcame her critics and dedicated her life to helping women choose and advance their careers. Schwartz perseverance is what changed my thinking.

RESEARCH METHODS

This study used prosopographical case studies and combinations of history and biography, beginning from the Summer of 1994 to the present. Prosopography means a study that identifies and relates to a group of persons or characters within a particular historical or literary context. Visit to the Julian Samora's Institute at Michigan State University on November 8, 1996. Reading of works published by the individuals themselves. The essay format is used to present the lives of these people in order to facilitate making historical knowledge available to a wider audience.

RESEARCH FRAMEWORK

Abraham Maslow and other humanistic psychologists see the goal of life as that of using it to accomplish something in which one believes(Thomas, 1995, p. 347). In examining the lives of these two individuals, I read "The Farther Reaches of Human Nature" by Abraham Maslow, "In a Different Voice" by Carol Gilligan, and "The Winner's Edge by Dennis Waitley. "Reviving Ophelia" by Mary Pipher. In addition, I read R. Murray Thomas's critic of the theory of humanistic psychology. My readings revealed that humanistic psychology is marked by the centering of attention on the person and a focus on experience as the primary phenomenon in the study of individuals. Emphasis is placed on such distinctively human qualities as choice, creativity, valuation, and self-realization, as opposed to thinking about human beings in mechanistic and reductionist terms. The overall view of humanistic psychology in my opinion is based on the person as he or she discovers his own being and relates to other persons and to society. I will integrate the various humanistic themes noted above as they relate to these individuals in my discussion.

INTERVIEW WITH The New York Times

After collecting data on two lives from The New York Times obituaries, I began to question myself on how The New York Times obtained all its information on the personal lives of these people. Therefore, on October 16, 1996, I called The New York Times. The operator put me through to Pany King, the Newsroom Editor of the Obituary section. My call revealed two things: first, there is the commercial obituary section where individuals call and pay to announce the death of their relatives. However, the operator informed me that she is putting my call through to the news division of the obituary section and that families do not pay if the deceased is considered newsworthy. This information was given voluntarily. This was an eye opener for me. I assumed that you had to be prominent to make The New York Times obituary section. When King answered the phone, I nervously introduced myself and became aware that what I am doing was unusual. Perhaps, only people reporting death call that line.

First, I discussed with King the reason for calling. My first question was: What is the criteria for selecting who is newsworthy for The New York Times obituary story? Secondly, I enquired how The New York Times gathered all the public and personal information on the lives of these individuals. King was very accommodating and made one request: she will answer my questions as long as I was prepared to be put on hold from time to time. The phones in the obituary news room is constantly ringing. King put me on hold four times before our interview came to a conclusion. What surprised me the most was the ease with which she spoke to me and her willingness to elaborate.

King stated that The New York Times receives information about the death of individuals through the funeral homes and the families of the people who died. The information is passed on to several editors to make a decision whether to assign a reporter to cover the death.

The next step is to look through the New York Times log and see if that person has been written about previously in The New York Times. After this process, if the individual is approved, a reporter is assigned to research and write a news story. The reporter will interview family, friends, and colleagues of the deceased to verify the authenticity of the information. A government data base is checked for additional information. As King spoke the phone rang again and she said to me that usually she will not spend so much time with one person on the phone, because she is very busy. In closing, she stated that the obituary news is not limited to the United States citizens only. The New York Times covers the death of prominent people world wide, as long as they are newsworthy. I thanked her and hung up.

PERSONAL MOTIVATIONS

It is important for me to state that I was influenced to do this study because of my daily interactions with undergraduate and graduate students at Michigan State University. The issues raised in this paper cut across race, ethnicity, gender, and class. The issues confronted are everyday issues. Personally, I am fascinated by people who have succeeded against all odds. Probably you yourself have confronted and overcome some of the challenges outlined in this paper. Moreover, your child, grandchild, great-grandchild, relatives and friends may one day confront some of the issues discussed in this paper. It is my intent that the lives of these two individuals will serve as a reference point for college students and the general public. It helps when people realize that their experiences, good or bad, have been lived through by people before them.

THE TWO LIVES: JULIAN SAMORA & FELICE SCHWARTZ

Julian Samora was the first recognized Mexican-American sociologist and a leader in founding the academic movement for Mexican-American studies. Julian was born in 1920 at southern

BEST COPY AVAILABLE

Colorado. He earned his bachelor's degree from Adams State College, a Master's degree from Colorado State University and a doctorate from Washington University in St. Louis. When Samora earned his doctorate in 1953, he became the first Mexican-American known to have received a doctorate in sociology and anthropology, a distinction that is generally hedged by the observation that if there had been any earlier Mexican-Americans who earned a doctorate in sociology, they made it a point to hide their ethnic heritage. Samora felt his entire career according to him had been fueled by anger, and pursued to prove that he was equal.

When his family was living in southern Colorado, he found it difficult as a child to walk through his hometown and find a sign at the entrance to the public park that read: "No Mexicans, Indians or Dogs." It did not help his frame of mind when he was forced to repeat the first grade because he spoke only Spanish, or when the entire cast of a high school play walked out after he was assigned a leading role. Again he lost a campaign for student body president at Adams State College by one vote, with his own roommate refusing to vote for a Mexican-American. Because of all these experiences Samora decided to use scholarship as a tool to combat prejudice and to improve the lot of his fellow Mexican-Americans. By using scholarship to combat prejudice Samora can be characterized with the humanistic theme of choice and self-realization. He made the choice to go to school and in the process realized that he could improve the lives of his fellow Mexican-Americans. By most measures he succeeded in his goal.

First Samora produced a torrent of research papers focused on Mexican-Americans. One of his early studies traced the different levels of hospital treatment received by Mexican-Americans and other Americans to the Chicano culture's preference for traditional remedies. Samora explored the correlation between ethnicity and the delivery of health services. The above study has been credited with helping to establish medical sociology as an independent discipline. Later, his professional efforts focused on making the dominant society aware of the national importance of Spanish-speaking people through his articles, reports, and books, including the "National Study of the Spanish Speaking People" for the U.S. Commission on Civil Rights. Samora taught at Michigan State University in 1957. Two years later he received a tenured position as professor of sociology at the University of Notre Dame. He turned Notre Dame into a magnet for Mexican-American graduate students, many of whom received doctorates and went on to high academic positions in Mexican-American studies programs that proliferated in the wake of Samora's success.

Using a series of Ford Foundation grants, he helped found the National Council of La Raza, widely regarded as the leading Mexican-American civil rights organization, and engaged in well-publicized research into the cultural links across the United State-Mexican border. Samora had a significant impact both in spotlighting and reducing the social barriers faced by Chicanos. His most influential work was often on a more personal level, whether serving as a distant role model for younger Mexican-American scholars, or in face-to-face encounter at academic conferences or at Notre Dame. He and his wife, Betty, turned their home into a Mexican-American student center.
It was a tribute to Samora's success that after his retirement in 1985 from Notre Dame, Michigan State University created the Julian Samora Research Institute in his honor to continue and expand his pioneering research into the Chicano experience in the midwest.

I personally visited Samora's center at Michigan State University on November 8, 1996. The center is located at the Paolucci Building, room 112. As I opened the door the first thing I saw was Samora's picture hanging at the wall, under the picture is a medium size book case with numerous articles and books written by Samora and about him. I was greeted by Rosemary Aponte, Assistant Director for Administration of Julian Samora Institute and Visha Samy, Administrative Assistant to the center. Aponte and Samy were excited that someone is interested in writing about Samora. I was allowed to look inside the bookcase and go through the pile of materials. The staff offered to copy any article that I was interested in using for my project. One article that I found inside the book case was titled "Remembering the Contributions of One Whose Journey Has Been Our Heritage" written by Refugio I. Rochin, professor and director Julian Samora Research Institute. This article was a tribute to the legacy of Samora. Rochin wrote, "Although Dr. Samora has left us, his memory and his legacy live on, testaments to the measure of the man."

The interactions between Aponte, Samy, and me was useful in the sense that I could relate to the impact Samora made in the lives of people who knew him. As I walked out the door, a thought struck me: Samora is an institution! Julian Samora died on February 2, 1996. His wife died 10 years ago. He was survived by a daughter Carmen, of Albuquerque; three sons, John of Denver, David of Sants Fe, N.M., and Jeff of South Bend and three grandchildren at the time of his death.

FELICE N SCHWARTZ

Felice Schwartz was the founder of Catalyst, a national organization that was dedicated to helping women choose and advance careers. The organization later promoted the participation of women in corporations and their recruitment on corporate board. Felice Schwartz was born in 1925 in New York. Schwartz attended Smith College and became involved in social causes while an undergraduate student at Smith College. In 1945, she founded the National Scholarship Service and Fund for Negro Students. The organization lobbied colleges and universities to open their doors to minority women. Schwartz helped in providing financial aid for college bound African-American women.

In 1946, Schwartz was married to Irving L. Schwartz, a scientist, educator and physician. They had three children. During the early years of her marriage, Schwartz and her husband had commuter marriage. The family first moved to Cincinnati where her husband had been offered a post at a medical school. However, Schwartz who was planning a new organization returned to New York with her three children to launch "Catalyst." As a result, her husband spent the next two years flying back and forth on weekends to New York. Schwartz return to New York to launch "Catalyst" is an example of the humanistic theory of choice, creativity, valuation, self-realization and society. For example, Schwartz realized that women still had a hard time balancing work and family. She took the initiative to find ways of helping women and men realize the difficulties women faced in their lives.

Catalyst pioneered several job-sharing pilot projects in which two women shared a full-time job. The organization undertook studies on family issues in the work place. Mrs Schwartz wrote "How to Go to Work When Your Husband Is Against It, Your Children Aren't Old Enough and There's Nothing You Can Do Anyhow." A second book, "Breaking With Tradition: Women and Work, the New Facts of Life, was published in 1992. In 1989 Schwartz prompted a national debate with an article she wrote that was published in the Harvard Business Review. The article asserted that it cost companies more to employ women than men. She noted in the article that women's careers were often interrupted, or ended when they had children and suggested that employers create policies to help mothers balance career and family responsibilities. Schwartz called for more flexibility in work hours and providing day care for working women with young children.

An uproar began immediately after her article was published. Her proposed alternative career track came to be called the "mommy track." Critics voiced the fear that by raising the higher cost issue, women would not be hired and promoted. That women would be left with the primary responsibility for child care. In response to her critics, Schwartz said her views were widely misinterpreted. In an interview with the Boston Globe in 1992, she said that she violated the politically correct thing by saying that women are not just like men. What she was saying then and still is saying now is that women face many, many obstacles in the work place that men do not face. Schwartz was saying to that group of men at the top, rather than let women's talents go to waste, do something about it.

Despite the adversity, Schwartz continued to emphasize a parent track because according to her, when a woman is faced with doing all the housework, all the child care and full-time work, she is stunted. The same applies to men. In my effort to understand how being stunted applies to men, I read "The Second Shift" by Arlie Hochschild. Hochschild's book was the first groundbreaking study on the dilemma of the working mother. What I found on page 260 of "The Second Shift," is that the most important injury to women who work the double day is not the fact they work too long or get too tired. The deeper problem women face according to Hochschild is that they cannot afford the luxury of unambivalent love for their husbands who do not help them do housework. That many women carry into their marriage the distasteful and unwieldy burden of resenting their husbands.

Schwartz remained the president of Catalyst for 30 years. She retired in 1993 and died on February 8, 1996 at the age of 71. She was survived by her husband; a daughter, Cassie Arnold of Washington; two sons, Tony Schwartz of New York City and James Schwartz of Boston; a brother, Theodore Nierenberg of Armonk, New York, and five grandchildren at the time she died.

CONCLUSION

Anyone reading this paper will readily discover that the experiences of these two lives are significant. This study is similar to Denise Waitley's study which was published in 1980 and republished in 1983. Waitley in his book "The Winner's Edge" stated that self-dimension action includes making a contribution to something or someone for which there is no direct payoff or obligation. This study supports Waitley's and Gilligan's conclusions that adversity can develop character, and character enables those who have overcome adversity to make contributions to society. The implications of this study is that adversity may be a destroyer, yet these two individuals survived and did not give up. The younger generation has to learn about the past experiences of the people who prevailed against all odds. Not much has changed from the experiences of these two extraordinary people. Teenagers and college students who find themselves in a hole, can be inspired by the different experiences of these people. To you, I say, do not give up!

ACKNOWLEDGEMENTS

The author wish to express her appreciation to the May Foley award from the College of Human Ecology, Michigan State University.

Even though historically the United States ranked first in education, presently it is experiencing decline, dropping to fourteenth in mathematics assessment and fifteenth in science assessment with Taiwan and South Korea, both third world countries, among the countries that outrank us (US Department of Education 231-233). Since today's students will be the leaders in industry in the subsequent generation, a concern arises that the economy of the U.S. could begin to decline reflecting our educational ranking.

In order to improve learning, it is necessary to understand how students learn, not just what they should learn. Having opened and operated a school for six years, my experience from the students that came to my school from other unsuccessful learning experiences at other institutions pointed to a need for another way of teaching, to which the global rankings also point.

Presently, the pedagogy of most educators is based on the behaviorist model, (Wadsworth 4) built on the theories of Ivan Pavlov, B. F. Skinner, E. L. Thorndike, and other influential behavioral psychologists. This theory contends that acquisition of knowledge is governed by external stimuli and conditioning techniques, biological or mental maturation, or development, is given little consideration. The learning techniques of the behaviorist theory involve giving the student an immediate reinforcement to his or her response to the stimuli presented in the form of a question. "Each student proceeds through the sequence of material at his or her pace, and each is reinforced or corrected after every response" (Smith & Smith 152).

The present educational system is also based on the mimetic behaviorist approach to education. That is, the teacher transfers the written or spoken word to the student resulting in learning by the student. When he or she does not learn, the fault is usually attributed to the student. The traditional or empiricists' position is that motivation is a result of reinforcement.

Piaget maintains that if one browses through the history of education books, one of the most apparent paradoxes is that those who were innovators in the field were not educators. The innovators came from various camps, such as Comenius who was trained to be a theologian and philosopher. Rousseau had children but held no classes, Froebel was a chemist and philosopher, Herbart was a psychologist and philosopher, Dewey was a philosopher, and Mme. Montessori, Decroly, and Claparede were medical doctors, with the latter two psychologists as well. He asked the question, "So why is pedagogy so little the work of pedagogues?" (qtd. in Gruber and Voneche 699). To which he answers, "The truth is that the profession of educator has not yet attained, in our societies, the normal status to which it has the right in the scale of intellectual values. . . . What the schoolteacher lacks . . . is comparable intellectual prestige (qtd. in Gruber and Voneche 699). Piaget believes that it is unfortunate that a teacher who is well thought of is one who does what is expected and has usually learned a few formulas that enable the student to believe that he or she is being educated. According to Gruber and Voneche (1995), this status quo mentality contributes to the unfortunate status of educators and education.

> Probably the best thing that each group of teachers can do is to invent the approach that fits their situation. Piaget's remark, that only by reinventing a theory can the child understand it, applies equally well to all adults. If the teacher is to understand what he is doing, he must invent it, he can neither invent it well nor understand it if he does not understand the child. What Piaget has done can only be an aid to that understanding, without which teachers cannot invent and reinvent their practice (Gruber and Voneche 694).

While Piaget's theory may seem simplistic at first reading regarding implementation into pedagogy, there are other factors to be considered in the present educational system. That it is an inclusive system which lays vulnerable to society's woes, such as poverty, divorce, and teacher burnout to name a few, adds to the dilemma, and certainly Piaget is not the only answer to these problems. But as an educator, I would like to consider his developmental theory as this could reduce some of the learning problems in the classroom. If a student and his or her developmental stage could be matched with the curriculum, the student should learn quicker. Within the behaviorist model, testing is used largely because it is a measurable device. Piaget offers nothing in which to provide such a secure method of determination of student success in a class. However, as a businesswoman, I must consider the global rankings of the United States, which, in time, will enter the economic arena. To prefer testing because it is measurable seems somewhat like not being able to see the forest for the trees. In order to construct knowledge according to Piaget, one must act upon the object.[1] This can be done nicely in the form of exploration in any subject through research and writing. If it were introduced to the student at an early level commensurate with development, research and writing may not be such a frightening experience for the student in high school and/or the university. A research paper done in any subject, on any developmental level, can be a tool for assessing a degree of success for the student.

The emotional component, which Piaget refers to as affect, may be utilized as an invitation to motivate the individual to attention and disequilibration. Disequilibration is the unbalance between assimilation and accommodation. Briefly, the process is that if an individual applies a construct of knowledge, or schema, and it works, then equilibration exists. If the schema does not produce a satisfying result, then disequilibrium exists, and the individual is uncomfortable. She or he continues to search for a solution in order to maintain equilibrium or balance. As an example, when one solves a mystery, exploration of all pertinent facts is conducted. So it should be with learning. The exploration can neither be planned nor should there be a time-constraint. The hypotheses and hunches should be tested repeatedly by the individual. The role of the teacher is to produce curiosity in the child and then employ methods to utilize the curiosity in order to provoke learning through disequilibrium.

One of the methodologies that has come about, largely due to the efforts of some educators who wish to apply the Piagetian theory, is the constructivist method. Iran-Nejad (1995) believes that Piagetian theory is constructivist because the individual constructs knowledge.

> Piaget's theory is constructivist because it implies the process of building, creating, or making mental structures instead of merely absorbing or reproducing products. To Piaget, the child's mind is self-organized by a constant antagonism between internal, subjective mental states and external reality. In Piagetian theory there is no objective ontological reality. According to this view, knowledge does not exist as a separate product ready to be unloaded in the classroom and consumed by the student. Knowledge is representative of existing reality for each individual. (Iran-Nejad 19)
>
> Constructivism is greatly influenced by Piagetian epistemology (Duckworth, 1987; Confrey, 1990, von Glaserfeld, 1984, Kamii, 1985). Duckworth (1987) defined constructivism succinctly: "Meaning is not given to us in our encounters, but it is given by us, constructed by us, each in our own way, according to how our understanding is currently organized. . . . According to Resnick (1987b), "We are in the midst of a major convergence of psychological theories . . . today, cognitive scientists generally share the assumption that knowledge is constructed by learners" (qtd. in Iran-Nejad 1995, pg. 16).

While not conclusive, research has verified Piaget's theory concerning the invariance of cognitive development. That is not to say that learning may not be facilitated in another fashion, but at the heart of this issue is the failure of the child to learn. When held accountable for this failure, the child resorts to cheating and other test taking strategies in order to improve his or her grade. A failure of a student due to mismatching development and curriculum leads to affective complications. If a student is in over his or her head academically, with proper guidance and support, learning can occur as the student accepts the challenge. However, the material to be learned cannot be beyond his or her developmental stage. The affective component of a failure environment is grave and in some cases, produces lifelong effects.

Within each of the developmental stages in Piaget's theory, there are certain characteristics representing qualitative changes in the individual's ability to reason.

1 The stages are characterized by qualitatively different reasoning with each new construction

2 The reconstructed reasoning is evident in all areas of reasoning, with objects and space taking on a new meaning

3 Each advance integrates existing knowledge with new knowledge providing a better more efficient adaptation to reality

4 Development is invariant, with less sophisticated reasoning giving way to more sophisticated reasoning with each stage

5 Each stage has its own characteristics of egocentrism

6 Intellectual development proceeds through disequilibration followed by assimilation and accommodation of experience "The control mechanism is affective, with unconscious feelings, tendencies, and inclinations functioning as gatekeepers for what experiences affect intellectual development" (Wadsworth 141)

7 Social interaction, one of the four variables in the Piagetian theory (the others are maturation and heredity, active experience and equilibration), is necessary for intellectual development Piaget defined social interaction as an exchange of ideas among peoples At all levels of intellectual egocentrism (affective and cognitive), social interactions are necessary as a tool for confronting ideas of others Even though construction of knowledge occurs in the mind of the child, a social context is often necessary for the construction to occur (Wadsworth 140-141)

Piaget believes that intelligence is an equally cooperative effort with cognitive, social, and affective aspects However, since Piaget wrote more on the cognitive development, researchers tended to see only this aspect Barry Wadsworth tends to broaden from the position of most researchers, maintaining without qualification that Piaget asserted that all three aspects play equal roles in intelligence "[A] careful reading of Piaget's writing makes clear that a view of intellectual development that includes only cognitive development without fully taking into account the affective aspects is incomplete" (Wadsworth 145) Knowledge is constructed when the individual encounters disequilibration, such as a discomforting thought that is at odds with the individual's schemata previously constructed This discomforting thought is made by the affective system Piaget and Inhelder write, "Affectivity, which includes feeling, interests, drives, tendencies (such as "will") and values, "constitute[s] the energetics of behavior patterns whose cognitive aspect refers to the structures alone There is no behavior pattern, however intellectual, which does not involve affective patterns as motives" (qtd in Wadsworth 146) Intellectual development is a unity of affect and cognitive conceptions

Piaget's theory can be considered a tool for analyzing educational practices to ascertain how they incorporate developmental principles Rates of development vary, even though their course is the same For example, half the adult population will not enter the formal operational stage Piaget maintains that the developing child has been ignored in favor of the educated or finished man

> How is one to define the new methods of education, and from when should we date their first appearance? To educate is to adapt the child to an adult social environment, in other words, to change the individual's realities to which the community consciously attributes a certain value There are, therefore, two terms in the relation constituted by education on the one hand the growing individual, on the other the social, intellectual, and moral values into which the educator is charged with initiating that individual The adult, viewing the relationship between these terms from his own point of view, began by paying attention solely to the second, and thus by conceiving of education as a mere transmission of collective social values from generation to generation And out of ignorance, or even on account of this opposition between the state of nature characteristic of each individual and the norms of socialization, the educator concerned himself at first with the ends of education rather than with its techniques, with the finished man rather than with the child and the laws of its development (qtd in Gruber and Voneche 695)

Piaget wrote the aforementioned quotation in 1935, in 1965 he writes that there has been no improvement in pedagogy since his previous writing He believes that part of the problem lies with the examinations that must be taken at the end of school, maintaining that the "use of these data entails both a begging of the question and a vicious circle

> A begging of the question, to begin with, because we are postulating that success in those examinations constitutes a proof of durability of the knowledge acquired, whereas the real problem, still in no way resolved, consists precisely in attempting to establish what remains after a lapse of several years of the knowledge whose existence has been proved once by success in those examinations, as well as in trying to determine the exact composition of whatever still subsists independently of the detailed knowledge forgotten On these two prime points, then, we still have almost no information A vicious circle, in the second place--and this is even more serious--because we are saying that it is possible to judge the value of scholastic instruction by success in final examinations when the fact is that a great deal of the work done in school is influenced by the prospect of those very examinations, and is even seriously distorted, according to some respected thinkers, as this preoccupation becomes increasingly dominant (qtd in Gruber and Voneche 697-698)

Jean Piaget maintains that "every organism interacts with the environment in an ongoing process that changes and refines the individual's conception and understanding of reality" (Smith & Smith 155) He is convinced that biological development is a process of adaptation to the environment and cannot be explained by maturation alone He believes "that the mind and body do not operate independently of one another and that the mental activity is subject to the same laws that biological activity generally is This led him to conceptualize intellectual development in much the same way as biological development This does not imply in any sense that mental behavior can be attributed completely to biological functioning, but that the concepts of biological development are useful and valid for looking at intellectual development Intellectual and biological activity are both part of the overall process by which an organism adapts to the environment and organizes experience" (Wadsworth 13-14)

Social interaction and collaboration are important to the learning process, especially in development of cognitive conflict and disequilibration Social interaction becomes even more critical when the child realizes that there is more than the viewpoint of the self Of course, social knowledge is only constructed when there is social interaction Strategies that can be used to evoke surprise such as the unknown and the unpredictable, can help in the learning process resulting in construction or reconstruction of schemata

Intellectual autonomy is learning how to make decisions, it is self-regulated and has an affective and a cognitive component Intellectual autonomy does not mean allowing the child to do whatever he or she deems desirable, nor does it mean abandoning the learning process It is the process of learning self-regulation, and of controlling and of directing the self efficiently, effectively, and responsibly Intellectual autonomy, according to Piaget, allows the individual to utilize her or his own values within relationships that provide shared values with mutual respect Affective autonomy integrates one's values with a sense of obligation to act on these values It stems from mutual respect relationships, and is based on freely chosen cooperation

Piaget's theory does not address individual differences, yet in any classroom there are considerable differences in intellectual development Traditional grouping seems to do little if anything to stimulate learning, and the students could be better served if the grouping were by interest In a typical class, the developmental stage can vary as much as eight years To group by ages can make the learning very difficult for the slow learner or those at the beginning of the developmental stage

Piaget maintains that an authoritarian model for the child is not sufficient to provide sound moral reasoning and behavior As is consistent with his theory, moral reasoning must be constructed by the individual

> It is absurd and even immoral to wish to impose upon the child a fully worked-out system of discipline when the social life of children themselves is sufficiently developed to give rise to a discipline infinitely nearer to the inner submission which is the mark of adult morality It is idle to try and transform the child's mind from outside, when his own taste for active research and his desire for cooperation suffice to ensure a normal intellectual development The adult must therefore be a collaborator and not a master, from this double point of view, moral and rational (Piaget 1965, p 404) (qtd in Wadsworth 160)

According to Jean Piaget and John Dewey, authoritarian teachers should modify their role so as to be collaborators and equals to the student As the child constructs moral knowledge and reasoning, moral behavior is consistent with these values In Piaget's theory, the behavior is under the discretion of the will If the individual has a strong will, then there usually will be a strong sense of obligation to ones values Wadsworth (1996, 16) maintains that the following guidelines are consistent with the Piagetian theory

1 Teachers should assume mutual respect in a non-authoritarian relationship with young children for at least part of the time, this mutual respect should occur all the time with high schoolers
2 Punishment, when necessary, should be based on reciprocity rather than expiation
3 There is intellectual value to any issue that a child might raise in the classroom spontaneously, including moral questions
4 Teachers can initiate discussions of moral issues, even with pre-school children The social interaction with the child's peers may lead to disequilibration, which may lead to a reorganization of their concepts
5 Responsibility, cooperation, and self-discipline cannot be transmitted to the child authoritatively, and the classroom should be structured so that the child can participate more fully Mutual respect relationships are vital "It is questionable whether children can develop concepts of justice based on cooperation in environments in which justice is based only on authority" (Wadsworth 161)

Jean Piaget's own words sum up the theory and provide the pedagogy Now the educators must provide the application

> *A student who achieves a certain knowledge through free investigation and spontaneous effort will later be able to retain it; he will have acquired a methodology that can serve him for the rest of life.*

Piaget, To Understand Is to Invent
(qtd in Wadsworth 147)

A Descriptive Survey of the Three Contemporary Approaches to Fluency Disorders

Peter Golleck

Honors Studies Program
University of Texas-Pan American
1201 West University Drive
Edinburg, Texas 78539-2999

Faculty Advisors:

Raymond Welch, Ph.D., Director

Teri Mata-Pistokache, Ph.D., CCC/SLP
Timothy Meline, Ph.D., CCC/SLP
Keri Parchman-Gonzalez, M.A., CCC/SLP

The purpose of this independent studies project was to do a descriptive survey of the three contemporary approaches to fluency disorders. The three fluency approaches are known as the stuttering modification approach, the fluency shaping approach, and the integration approach. By reviewing abstracts, journal articles, and books, the three fluency approaches were compared with regard to their four goals and two clinical procedures. The findings revealed that *feelings and attitudes* and *general communication skills* are distinguishing characteristics for the stuttering modification approach; *structure of therapy* and *data collection* are distinguishing characteristics for the fluency shaping approach; while *speech behaviors* and *fluency maintaining strategies* are distinguishing characteristics for the integration approach.

BACKGROUND

Stuttering is an astonishing act which confuses and sometimes exasperates listeners. "Why doesn't he go ahead and say what he needs to say," people often ask, "instead of stopping and starting and stumbling around like that?" The basis of stuttering lies in its disruption of fluency. Stuttering occurs when the forward flow of speech is interrupted abnormally by repetitions or prolongations of a sound, syllable, or articulatory posture, or by avoidance and struggle behaviors (Van Riper & Emerick, 1990). Like theories on the cause of stuttering, assumptions about its treatment have wavered between widely divergent views (Bloodstein, 1993). Reduced to its simplest form, however, the attempt to help clients who stutter has veered back and forth between methods that teach clients to *talk differently* and methods that teach clients to *stutter differently.*

THREE FLUENCY APPROACHES

The three main therapeutic approaches for stuttering have all evolved since the 1930s. They are the traditional, operant, and integration approaches. Presently, the term *stuttering modification therapy* is used to describe the traditional approach. The term *fluency shaping therapy* is the contemporary term used to describe the operant approach, and the *integration* designation remains unchanged. With that in mind, stuttering modification therapy, fluency shaping therapy, and integration therapy can be compared in many ways. Guitar and Peters (1980) feel, however, that the following six comparisons are the most important with regard to the treatment of stuttering. Four of these comparisons relate to: (a) feelings and attitudes, (b) speech behaviors, (c) fluency maintaining strategies, and (d) general communication skills. The two clinical procedure comparisons deal with (a) structure of therapy and (b) data collection (Guitar & Peters, 1980). Each approach will now be given a general overview and their goals and clinical procedures analyzed.

Stuttering Modification Approach

Stuttering modification therapy refers to an approach to stuttering based on the theory that most of the stutterer's problems in speaking are the result of avoiding or struggling with disfluencies (repetitions and / or prolongations), avoiding feared words, and / or avoiding feared situations. The process of therapy includes reducing avoidance behaviors, speech related fears, and negative attitudes toward speech. It also includes helping the stutterer learn to modify the form of his stuttering. This can be done in a variety of ways. For example, the stutterer can reduce his struggle behavior and smooth out the form of his stuttering. He can also reduce the tension and rapidity of his stuttering to stutter in a more relaxed and deliberate manner. To that end, the goals and clinical procedures will now be discussed.

Goals of Therapy

1. *Feelings and Attitudes:* Guitar and Peters (1980) state that stuttering modification therapy places a great deal of emphasis upon reducing the fear of stuttering. The area of feelings and attitudes is definitely a distinguishing characteristic of the stuttering modification approach.
2. *Speech Behaviors:* Guitar and Peters (1980) believe that most speech pathologists who practice the stuttering modification approach see their ultimate goal for the client to be able to speak normal (spontaneous fluency).
3. *Fluency Maintaining Strategies:* Guitar and Peters (1980) reveal that speech pathologists who practice the stuttering modification approach urge their clients to stop avoiding words or situations.
4. *General Communication Skills:* Guitar and Peters (1980) state that stuttering modification therapy gives consideration to speech flow after stuttering behavior is reduced. The area of general communication skills is also a distinguishing characteristic of the stuttering modification approach.

Clinical Procedures

1. *Structure of Therapy:* Guitar and Peters (1980) state that stuttering modification therapy is usually conducted within a teaching or counseling situation.
2. *Data Collection:* Guitar and Peters (1980) state that speech pathologists who practice the stuttering modification approach do not put a great deal of emphasis upon the collecting and reporting of objective data.

Fluency Shaping Approach

Fluency shaping therapy is based on operant conditioning and programming principles (for example: successive approximations of antecedent stimulus events, and use of reinforcement of appropriate responses). In a fluency shaping therapy program, some form of fluency is first established in a controlled stimulus situation. This fluency is reinforced and gradually modified to approximate normal conversational speech in the clinical setting. This speech is then generalized to the person's daily speaking environment (Guitar & Peters, 1980).

Goals of Therapy

1. *Feelings and Attitudes:* Guitar and Peters (1980) state that speech pathologists who practice the fluency shaping approach do not directly attempt to reduce the client's fear of speaking; however, it is felt that often the programming leads to a reduction in fear.
2. *Speech Behaviors:* Guitar and Peters (1980) feel the adherents of fluency shaping therapy also have as their goal spontaneous fluency.
3. *Fluency Maintaining Strategies:* Guitar and Peters (1980) reveal that speech pathologists who practice the fluency shaping approach stress the maintenance of fluency by such techniques as slowing speech rate or monitoring speech carefully.
4. *General Communication Skills:* Guitar and Peters (1980) state that speech pathologists who practice the fluency shaping approach suggest that organization and flow of verbal output may be an important consideration for treatment.

Clinical Procedures

1. *Structure of Therapy:* Guitar and Peters (1980) remark that fluency shaping therapy is usually performed in a highly structured situation. With that in mind, structure of therapy is a distinguishing characteristic of the fluency shaping approach.

clinical procedures (cont'd)

2. *Data Collection:* Guitar and Peters (1980) reveal that speech pathologists who practice the fluency shaping approach put a great deal of emphasis on the collection and reporting of objective and reliable data. Data collection is definitely a distinguishing characteristic of the fluency shaping approach.

Integration Approach

Guitar and Peters (1980) state that during the past 25 years there has been increasing controversy between the proponents of the stuttering modification approach and the fluency shaping approach. In recent years, however, many speech pathologists have found that techniques based upon the stuttering modification approach can be beneficial to those employing the fluency shaping approach (Guitar & Peters, 1980). With that in mind, when both approaches are combined, the approach is referred to as the integration approach. Essentially, the integration approach may offer more to the person who stutters because this approach encompasses everyone who is involved with helping the client stutter less, such as family, friends, teachers, and coaches.

Goals of Therapy

1. *Feelings and Attitudes:* Evins-Smith states that feelings and attitudes are more important to the older stutterer and less important to the youngster who stutters (personal communication, 1996).

2. *Speech Behaviors:* Evins-Smith states that speech behaviors can be used to reinforce fluency (personal communication, 1996). Speech behaviors are a distinguishing characteristic of the integration approach because the integration approach involves the entire family.

3. *Fluency Maintaining Strategies:* Evins-Smith (personal communication, 1996) states that it is important to check the family's "checks and balances," for example, parents being conscious of their child's fluency techniques. With that in mind, fluency maintaining strategies are a distinguishing characteristic of the integration approach.

4. *General Communication Skills:* Evins-Smith states that Hugo Gregory's ERA-SM (Easy Relaxed Approach-Smooth Movements) can be used for any person who stutters to generalize their speech (personal communication, 1996).

Clinical Procedures

1. *Structure of Therapy:* Evins-Smith states that structure of therapy can be either structured or non-structured, intensive or non-intensive (person communication, 1996).

2. *Data Collection:* Evins-Smith states that it is important to track every session, in order to gather a quantitative ratio (personal communication, 1996).

CONCLUSION

In summary, the findings revealed that *feelings and attitudes* and *general communication skills* are distinguishing characteristics for the stuttering modification approach; *structure of therapy* and *data collection* are distinguishing characteristics for the fluency shaping approach; while *speech behaviors* and *fluency maintaining strategies* are distinguishing characteristics for the integration approach. Implications based on these findings include that transfer and maintenance need to be more prominently addressed during the course of treatment, as opposed to simply direct therapy that takes place in the therapeutic setting. Moreover, therapy for the person who stutters should not end just because that person is dismissed from therapy. A speech pathologist should be assigned to monitor that person's speech periodically (for example: once a month). To that end, *transfer* of behavior change involves the occurrence or acquisition of changes in behavior in situations other than where the previous learning took place (Fraser, 1994). Similarly, *maintenance* of behavior change refers to the continuation or persistence of speech and attitudinal changes over time (Fraser, 1994). Until transfer and maintenance issues are more clearly addressed during the course of treatment, people who have fluency disorders will continue to struggle with the depressing problem of having their stuttering resurface.

267

With an emphasis in therapy placed on the issues of transfer and maintenance, the person who stutters will be less likely to have his stuttering resurface because he will have a speech pathologist available to answer various questions he may have about times when he feels his stuttering is resurfacing.

Cosmos and Chaos:
An Analysis of Themes and Issues in Doris Lessing's The Fifth Child

Anna C. Long

Honors Program
Seattle University
Broadway and Madison
Seattle, WA 98122

Faculty Advisor:

Hamida Bosmajian

In a narrative about literal reversions to primitive states of being, Doris Lessing effectively communicates her ideas about the nature of time and our societal notion of fate. These themes have evolved, both in Lessing's conscious meditations on our society's current state of mind and in her fictions. Her reflections in Prisons We Choose to Live Inside (a series of lectures given in 1985) appear to be especially formative for the images and ideas communicated in The Fifth Child (1988). However, beyond Lessing's conscious intentions, The Fifth Child is also a literary work clearly influenced by and paralleling the emerging interdisciplinary field known as the science of chaos.

In The Fifth Child (1988), Doris Lessing tells the story of David and Harriet Lovatt, a young couple who meet, fall in love, acquire a large house, and fill it with happiness and four children in quick succession. However, the story makes it clear that the Lovatts choose their home-centered lifestyle in ignorance. Their dream of escaping from the world around them collapses with the birth of Ben, the fifth Lovatt child. Harriet's painful pregnancy results in an alien birth; the horror of this fifth child brings the Lovatt's self-centered existence into question. The narrative not only exemplifies Lessing's social beliefs, but it attests to the emerging scientific theory of chaos. As a text representative of this new idea, The Fifth Child relates local sites to global structures, questions the relationship between order and disorder, and shows an awareness that small causes can lead to massive effects. A close textual reading of The Fifth Child will enable us to determine the Lovatt's unexamined motivation for living the life that they choose, their odd relationship to time and history, and will uncover the presence of a propelling fate that far exceeds the Lovatt's control and imagination.

Harriet and David Lovatt, the protagonists of The Fifth Child, are motivated by an unexamined and unquestioned need to create a family. Their desires and vague notions are rooted in nostalgia and an uncomprehending view of the past. Unfortunately, these easily accepted and simple drives lead to disaster on a much greater level. For Harriet, establishing a family is an unexamined desire originating in her childhood. Her mother "was a contented woman" (Lessing, *Fifth* 7) and her parents had "taken it for granted that family life was the basis for a happy one" (7). Although David's background was one of divorce, "quite different" (7) from Harriet's, his unexamined motivation to have his own family is also rooted in the past. In fact, David wants his life to "annul, absolve, cancel out all of the deficiencies" (13) of his parents' lives. The combination of two individuals with identical unexamined desires based on "the enormity of their demands on the future" (8) is not disastrous because of the content of their desires, but because of the ignorance with which they are grasped and achieved. Lessing, in her highly developed critique of "not thinking" (Lessing, *Prisons* 25), claims that people blindly "crave certainty, they seek certainty, and great resounding truths" (21). The Lovatts, in their blindly optimistic grasp of their reproductive calling in life, are actively seeking certainty and refusing to acknowledge, with their choices, the "horrors of which we are capable" (9). For the Lovatts, this means a constant denial of the extraordinary and the cynical outside of themselves with an insistent and "stubbornly held view of themselves, which was that they were ordinary and in the right of it" (Lessing, *Fifth* 3).

Lessing's critique of the Lovatts is not aimed at debunking their old-fashionedness, but rather at critically examining their overconfidence that their own ways are better than others'. The moment that the Lovatts meet, they reduce themselves to a tunnel vision which only expands wide enough to contain themselves and their future off-spring. Their initial conversation is symbolically placed in a closed room after they escape the party at which they have effectively objectified all persons. Instantly, Harriet "knew [David's] look of watchful apartness mirrored her own" (4). Their actions and choices continually omit strangers and in fact, all awareness of social situations outside of family gatherings. Eventually, even those closest to them are not immune to the most intimate criticisms which stem from their cloistered and self-absorbed mind-set. To begin with, their process of acquiring an enormous house ("'Are you going to run a hotel?' enquired Frederick" (12)), assumes a role of utmost importance. In fact, the Lovatts expect their parents to pay for the house and family, David's father with monetary assistance, and Harriet's mother with her endless labor. The Lovatt's "demand on life" (37) is excessive and exclusive. Harriet even excludes her own sister when she attributes her sister's Down's syndrome daughter, Amy, to marital discord, which "probably attracted the mongol child" (22). With her narrow view of the world Harriet smugly feels that her own happiness based on four perfect children is deserved.

This "since I am right, you must be wrong" attitude that the Lovatts represent is examined in Lessing's lecture "You Are Damned, We Are Saved" (Lessing, *Prisons* 17). Lessing claims that "when we think, reflect, and allow our rational minds to dominate us, we... suspect that this 'I am right, you are wrong' is, quite simply, nonsense" (16). The lecture suggests that seeing one's self as simply "*a* communist," or "*a* right-wing conservative," is always going to be too narrow to be correct or finally conclusive. In fact, Lessing often employs the phrase "being in the right" in her 1985 series of lectures. "There is no such thing as my being in the right...within a generation or two, my present way of thinking is bound to be found perhaps faintly ludicrous..." (16). We find echoes from Lessing's meditations on belief structures in the description of the Lovatts and their unconsciously exclusive attitudes towards all around them. In a comfortable smugness, the Lovatts say, "And look, they had been right to insist on guarding that stubborn individuality of theirs, which had chosen, and so obstinately, the best..." (Lessing, *Fifth* 21). The Lovatt's concept of "right" is certainly not capable of expanding to include others.

We also find that because of their narrowness, David and Harriet cannot see themselves in multiple roles or even accept inner paradoxes. Instead, they view their lives as a linear progression through time ("their story" (6)) which rises when they meet at the work party , continues until "they were made for each other" (6), and climaxes with a large Victorian house "full of space for children" (8). They see their deepest and best selves as called into being solely by the execution of the parental role. Oddly enough, their image of a Victorian house bustling with children is based on a way of life which they have never known; it is an imagined nostalgia for a past which seems ridiculous from the standpoint of their late 1960s environment. This strange relation to time shows us that their relationship, and even their physical intimacy, is a sort of a "throwback." This is clearly exposed in the discussion of Harriet's virginity. Harriet had not thought of herself as a virgin, "but rather as something like a present wrapped up in layers of deliciously pretty paper, to be given, with discretion, to the right person" (5). The "enlightened girls of now" (5) attribute her abnormality to some psychological problem, while the "good women of her grandmother's generation" (5) would have accused them of immorality.

The text further supports the idea that the Lovatts believe they are struggling against the time that they live in. "The Lovatts were a happy family. It was what they had chosen and what they deserved" (21). This achievement is obviously seen by both of them as the fulfillment of all that they have hoped for in life. "It had been hard preserving their belief in themselves when the spirit of the times, the greedy and selfish sixties, had been so ready to condemn them, to isolate, to diminish their best selves" (21). The Lovatts seem to think that the castle of their home is the only safe place in the world. "The Lovatts made themselves read the papers and watch the News on television, though their instinct was to do neither" (22). Their insistence on creating this "fortress, their kingdom" (22) denies the time in which they live, and allows for fatalistic notions to creep in. However, the Lovatt's view of fate or nature and its operations has not been broad enough to include its relation to necessity and to history. This is brought out when Harriet's mother rebukes her for saying, simplistically, that in another country it would be normal to have six or eight children. Dorothy says, "'if you were in . . .Egypt or India or somewhere, then half of them would die and they wouldn't be educated either. You want things both ways. . .It seems to me you haven't thought it out'" (16). Here we find the Lovatt's "fatal flaw"; they have slighted reason and history in order to attend to their own personal fantasy which is both out of place and out of time. This flaw creates vulnerability that allows space for ideas of fate and deserved retribution to grow in the Lovatts.

To begin with, we see something greater than human desire at work in the story when David and Harriet instantly recognize each other as destined mates. It is almost as if they think of being "made for each other" (6) as a literal phrase which defines a physical destination. The speed that whirls them past any sort of courtship and directly into marriage revives the ancient idea of fate, but also serves to keep the reader from empathizing too strongly with the Lovatts. The manner in which they conduct their first lovemaking creates a very powerful scene. Harriet almost stops the ancient myth of fate's control with reason, "For had they not decided to put off having children for two years?" (10). Instead, she is "overwhelmed by [David's] purpose--yes, that was it, he was making love with a deliberate, concentrated intensity. . .taking possession of the future in her" (10). This momentous occasion is out of the ordinary and they lay there until they are themselves again and able to "kiss with small reassuring daytime kisses" (11).

Harriet's acceptance of the inevitability of her maternal destiny also hints that an underlying force is active in their lives. When she tells David that Sarah and William's quarrelling had probably attracted the mongol child, he is upset. "David disliked this trait of Harriet's, a fatalism that seemed so at odds with the rest of her. He said he thought this was silly hysterical thinking: Harriet sulked and they had to make up" (22). Harriet's position is out of time and assumes a methodical divine retribution that strikes those who do not choose what is "ordinary and in the right of it" (3). The Lovatts do not believe in randomness or bad luck; on the contrary, the divine retribution that they have received is completely positive. When they lay face to face, "the doors in their breasts flew open, and what poured out was an intensity of relief, of thankfulness" (21). This glory that the Lovatts take in their rightful reward of happiness on earth is quickly dissipated by the satirical tone which Lessing occasionally uses, and by the continual foreshadowing of the approach of something wicked.

In addition to the direct presence of fatalism in the novel, hints at the working of fate are given in the reactions of others to their decision to reproduce incessantly. William says, "'Give it a rest, Harriet. That's all we ask of you'" (26). Harriet and David enjoy seeing themselves as rebels, going against their families and the modern logic of family planning. Even when Sarah, Amy's mother, pleads for them to recognize the randomness of fate, "they all knew she was saying, four more challenges to destiny" (27), David and Harriet refuse. They believe that their rightness and marital harmony shield them from such disasters. David and Harriet's extended family does not just scorn their actions, they also scoff at the root and source of the actions, ideas as ridiculous as Harriet's announcement that "'This is what everyone wants, really, but we've been brainwashed out of it'" (27). Even James, usually silent except for monetary donations, corrects Harriet, "'You're quite wrong, Harriet. The opposite is true. People are brainwashed into believing family life is the best. But that's the past'" (28). The inevitable financial burden of educating the future brood is discussed; "'How do you know James will be able to help you? Anything can happen in the world'" (30). William adds to this admission of fate with "'Anything does, all the time'" (30).

However, Harriet and David are oblivious to warnings of impending doom. Together at the window they exchange a look, "half guilty because of the irrepressible smiles on their faces, which they felt were probably going to exasperate the others" (31). Hints gradually make it clear that some agency outside of ordinary life is driving the novel. The realistic, practical text, is pulled from beneath by some foreboding subtext which we occasionally glimpse. In particular, the Lovatt's view of Bridget is what finally makes them see themselves uneasily. Bridget is an adolescent girl who visits the Lovatts; she adores and covets the family atmosphere in their home. The question looms when they realize that she shouldn't be expecting so much because life is not like that: "But life *is* like that, if you choose right; so why should they feel she couldn't have what they had so plentifully?" (31). The final clue that we receive of the horrors which are to come at the hand of fate is the unexpected pregnancy. "How could it have happened? They had been careful, particularly so because of their determination not to have any more children for a while" (32). With this final note, the horror of something far beyond their knowledge and control begins the destruction of their self-righteous fortress.

With a theme of fate so deeply imbedded in the text, The Fifth Child is obviously concerned with the individual's choices in relation to a much larger societal and even cosmic system. Although Lessing may not have any specific knowledge about chaos theory, she is obviously aware of the newfound implications that the theory points to: the drastic impact that an individual's actions can have on a much broader scale, and the possibility of the integrated nature of order and disorder. The ecological perspective that Lessing's writing represents is closely tied to chaos theory in that they both deal with the integral and intricate connections that tie the specific, local event to a larger, global phenomenon. The Fifth Child not only literarily represents Lessing's personal philosophies regarding social awareness, it also stands as a witness to the intensity with which our culture is currently focused on the idea of chaos.

The emerging science of chaos began with the study of non-linear systems and looks for "recursive symmetries between different levels of the system" (Hayles 170). While James Gleick's bestseller, Chaos: Making a New Science (1987), gives us a historical narrative about the development of chaos theory, N. Katherine Hayles argues that the paradigm shift towards chaos has been building in our culture over time, fueled mainly by the growing complexity of information (Hayles 196). Lessing's novel reflects and incorporates this evolving notion of chaos as both a potentially empirical predictor and as a mythic solution to the unexplainable. Although this unspoken theme is not necessarily a conscious part of Lessing's creative process, it is a pervasive and effective part of her literary style. Hayles claims that Lessing's writings show the importance of a concept that is entering into our cultural discourse through the observations and creations of many disciplines, not just that of theoretical science (236).

While The Fifth Child retains an un-fractured narrative line structure, the ramifications of symbols and events in the novel grow almost exponentially, leaving a linear cause and effect system unapplicable to the Lovatt's situation. With a neutral, informative style, Lessing presents the story as a mere set of facts or series of events. This style lays out the plot of the Lovatt's life in a sterile manner, while the events taking place quickly dismantle our typical ideas of order and disorder. The symbolism that Lessing chooses to employ in her description of the Lovatts' life also emphasizes the gap between the local and the global, while the events taking place leave the two sites inextricably connected. The process which Harriet goes through in an attempt to rationalize Ben's existence further proves that predictability is not a constant, and that a traditional linear system could not account for the experiences that Harriet goes through.

An argument could be made for the underlying presence of a complex, chaotic system in the very sequence of events that Lessing presents in The Fifth Child. David and Harriet's ignorance and self-righteousness could be seen as the local and specific site leading to the horrible event of Ben's creation which holds cosmological implication. This simplistic analysis of the novel would easily lend itself to analogy with the now trite example of "a butterfly stirring the air today in Peking can transform storm systems next month in New York" (Gleick 8). However, this perspective on the narrative may be too narrow and could consequently restrict interpretation. Although Lessing certainly juxtaposes the local site of the Lovatt's ignorance with the global picture of Ben's horror, she does not draw a complex web of inter-relating variables between the two. In fact, the information that she chooses to present the reader with further problematizes any connection that there may be. Lessing does not take the same stance that a person embracing chaos theory would: that all apparently random and disorderly events are actually microcosms contained in a much larger, ordered system. The narrative conveniently refuses to place Ben and the Lovatts as any part of a larger, unified system. Harriet's final speculations about Ben are both smaller and larger than real life; she sees Ben through the reductionist scope of the black box television, but also in the expansive stretches of her imagination. This paradox of rational containment juxtaposed with the vast unknowable reaches of Ben's existence is at the heart of The Fifth Child.

Lessing successfully uses the symbols and images of The Fifth Child to accentuate the apparent gaps and paradoxes between the local and global, and the orderly and disorderly. The effectiveness of this tool greatly depends on the current societal fascination with chaos theory and unpredictability, and the doubt in the traditional binary systems of logic and predictability. Lessing is intensely aware of these trends when she writes about the Lovatts creating a "fortress, their kingdom" (22) as a physical and mental barrier against "the greedy selfish sixties" (21). This symbolic barrier between two extreme ways of thinking helps Lessing create two separate worlds which, on the surface, may never be integrated, or even meet. Allusion to the Lovatt's classical bed, and the presence of the television as their only connection with the real world further accentuate the gap between the local and the global. The order and peace that the Lovatts presume is in their household is seen atomistically; they do not realize how close they are to the global unrest that surrounds them.

Perhaps an even greater amount of tension is created in the narrative by the imposition of Lessing's informative style on the dreadful connotations of the words used to describe Ben. The child is every bit as alien as they have imagined: Ben emerges violently from his mother's womb, weighs in at eleven pounds, and is "muscular, yellowish, long" (48). His father's first response is a dismayed, "'He's a funny little chap'" (48). Harriet's reaction is stronger, "'He's like a troll, or a goblin or something'" (49). Ben begins his infancy by bruising his mother's nipples, attacking his grandmother and his siblings, and killing family pets. Obviously this living situation becomes intolerable, and Ben is referred to as a "Neanderthal" (53), a "changeling" (59), and "throwback" (106). David and Harriet feel Ben has "willed himself to be born...invaded their ordinariness" (58), which is actually the product of a conscious commitment to a narrow and private vision, and not "ordinary" at all. The novel shows us the disaster that Ben brings to the Lovatt family; all that was formerly "right" and "ordinary" is stripped away by this chance genetic mutation. The horror of these events is intensified by the clinical tone with which they are conveyed. By writing about Ben in this manner, Lessing is welcoming the thought of unpredictability, inviting it into the world of logical linguistic representation, and using this tool to further accentuate the gap between the ordered and the unknown.

Lessing aligns Ben's undeniable difference with Harriet and David's ignorance, leaving the possibility that a localized event feeding back into a complex system can result in horror of global proportions. The bulk of the narrative is devoted to Harriet's attempts to rationalize Ben's innate disorder and horror. She searches for some physical explanation with repeated trips to the doctor, attempts to devote herself to him in an effort to infuse him with mothering, and tries giving him behavioral training. All of her time and effort are spent on Ben; she wants to reason away his alien nature, and place him in his pre-ordained role of the perfect fifth child. Harriet's frustration is increased when no professional will acknowledge Ben's differences. Everyone is anxious for him to fall under the range of the standard, normal curve of child development. With the birth of Ben, Harriet's ideas of her family's cocooned immunity are forced to change. Her concepts of the private and public sectors as distinct entities collapse as she realizes that Ben's existence has global significance and that her devotion to him will mean that she cannot maintain her previously vital sanctuary (65).

Harriet tries to establish a spatial and temporal context for the disaster that has become their lives by balancing her cosmic and evolutionary view of things with a more individual one. While she can hypothesize that the genes of "all those different people who lived on the earth once--they must be in us somewhere" (114), she also feels, without any rationality, that she and David are being punished for some sort of hubris. She says, "'We are being punished that's all . . . For presuming'" (117). David is extremely disturbed by this, "'Gods, distributing punishments for insubordination...Don't do it, Harriet...if you have to, then leave me out. I'm not going to be dragged back to the Middle Ages'" (118). The idea that we have scientific knowledge of ourselves as social and evolutionary beings, but refuse to fully incorporate that knowledge into our lives is one of the major themes in Lessing's Prisons We Choose to Live Inside. Lessing tells us, "I believe that we are in the grip of something very powerful and very primitive, and that we have not yet begun to come to grips with it. To study it, yes, that goes on in a hundred universities. But to apply it--no" (Lessing, *Prisons* 28). These conflicts are both logical and mythological fears that fail to explain a non-linear series of events like that which the Lovatts were a part of. Lessing realizes the inadequacy of these explanations and the impact that their failure can have on our consciousness.

Lessing's own stance on social issues and the "unexamined life" calls for us to look beyond the immediate cause and effect relationships that our choices are a part of and see the possibility of global repercussions. This technique of presenting a seemingly impossible situation and a complex tangle of ethical questions, is what makes The Fifth Child so effective as a novel. The reader is almost forced to ask and answer these questions for themselves. What will reign, reason, or the out-moded idea of fate? Can individuals go against history without experiencing personal disaster? Harriet's final image of Ben, disappearing into the underworld to search for others of his kind, presents him as the bearer of inevitable future which the Lovatts have tried to ignore. Lessing tells us that "Laughter is a very powerful thing, and only the civilized, the liberated, the free person can laugh at herself, himself" (44). I have reached the end of The Fifth Child and I am not laughing. The horrors presented in this short novel prove humankind to be essentially uncivilized, chained to a powerful, primitive part of our past that we will never be released from. However, Harriet has one last hope. Through distance of perspective, she may someday find herself objectifying this horror that was born of her. As Lessing puts it, "people outside can easily see it" (51). When Harriet finally sees Ben through the flat lens of the television box, freedom from his intense grip on her emotion and reason may be achieved. And with this freedom, perhaps there will be freedom from the ancient thoughts of fate, divine retribution, and thunderbolts from on high. This freedom, if it is possible, would be divine, freeing us from thoughts that lead, as David tells Harriet, to "Pogroms and punishments, witch-burnings and angry Gods" (118).

Toni Morrison's Sula: The Pharmakos of Her Community

Sula, the eponymic character of Toni Morrison's novel, is as mysterious to the reader as she is to her community. Sula focuses primarily on the lives of several strong women in the Bottom, an African American community, during the years 1919 to 1965. In the Bottom life is hard and isolated from the rest of the world. Sula is one of the few characters who leaves and returns. From childhood on Sula is marked by difference, in appearance and behavior. It is that difference that leads the community to consider her a scapegoat. It is the function of Sula as scapegoat or rather as *pharmakos* that I will describe in the following discussion, for in the tradition of *pharmakos* Sula is both the poison and antidote of her community.

In his Anatomy of Criticism, Northrop Frye re-defined scapegoat as *pharmakos* and as a literary archetype:

> The pharmakos is neither innocent nor guilty. He is innocent in the sense that what happens to him is far greater than anything he has done provokes, like the mountaineer whose shout brings down an avalanche. He is guilty in the sense that he is a member of a guilty society, or living in a world where such injustices are an inescapable part of existence. (Frye 41)

The prefix "pharm" of pharmakos is also evident in the words "pharmacy" and "pharmaceutical." As these latter words signify a cure for human sickness, so does the pharmakos become the cure for society's problems. The society has thus conveniently defined the problem and the solution to exist in one person. However, the society's creation of a pharmakos must be looked at critically, for its justification often seems erroneous and its results are only temporary.

The pharmakos is a tragic figure in the modes of tragedy and irony where he or she attracts the reader's sentiment or pathos. This pathos is aroused by a depiction of the character as isolated from society by a weakness, which appeals to our sympathy because it is on our own level of experience. The pathos of the tragic figure arises from the isolation of the figure from their own community, as Frye states:

> The root idea of pathos is the exclusion of an individual on our own level from a social group to which he is trying to belong. Hence the central tradition of sophisticated pathos is the study of the isolated mind, the story of how someone recognizably like ourselves is broken by a conflict between the inner and the outer world, between imaginative reality and the sort of reality which is established by a social consensus. (Frye 39)

The conception of irony is also important in the creation of the pharmakos because irony involves an absence of moralizing. Irony "takes life exactly as it finds it," but it results in a sense of hopelessness because the fate of the ironic character is arbitrary or counter-intuitive (Frye 41). Frye concedes, "Irony isolates from the tragic situation the sense of arbitrariness, of the victim's having been unlucky, selected at random or by lot, and no more deserving of what happens to him that any one else would be" (Frye 41). Thus, the pharmakos will become isolated from her community regardless of whether she deserves it or not. Such is the case in Sula, where the community unwarrantedly creates a scapegoat in Sula through a process of myth and rumor.

Morrison often uses a vivid sense of community as a seemingly active character in Sula. From the very start the reader is drawn into place where close inter-personal relationships unify the community. Isolated by race, location, and economics, the Bottom develops into a neighborhood wherein feelings and attitudes, although quite dynamic, are collectively felt. A primary distinction of the neighborhood is its passive acceptance of evil: "They let it run its course, fulfill itself, and never invented ways either to alter it, to annihilate it or to prevent its happening again. So also were they with people" (Morrison

89-90). This stoical endurance of evil can be seen as a form of skeptical indifference or fear. In any case, it becomes self-defeating in the light of what Barbara Christian specifies: "[The community's] view of survival and of Nature exists only on the physical plane and is rooted in the fear of dying rather than in a desire to live" (Christian 53). In a community where "the purpose of evil was to survive it," the people of the Bottom struggle to separate themselves from the intense imminence of evil (90). Hence, there is a definite reversal of the citizens of the Bottom and how they see themselves "above" the clutches of evil: "They didn't stone sinners for the same reason they didn't commit suicide—it was beneath them" (90). As we see in the novel, this futile struggle leads the Bottom to create a scapegoat that will carry the burden of evil.

The sense of fear felt by the community in Sula results in their creation of false objects of evil instead of dealing with the issue of evil itself. The characters seem to create external structures and focus on these instead of actual causes. For example, Shadrack, a war veteran residing in the Bottom, founds National Suicide Day, an event that is highly regarded by the community. National Suicide Day is a means to impose order over fear, not death, that is felt by the community. Being allowed to kill themselves and each other only on January third, the community's fear is somewhat ordered and even alleviated—National Suicide Day gives the community one day to anticipate and overcome, as opposed to a daily fear of death. Of course, this ritual is seen as absurdity to an outsider, but the Bottom appreciates it in order to depreciate its immense fears. The practice is important to the community psychologically. Yet, it is crucial to note the community's insistent neglect of dealing with the true causes of evil, and its constant recognition of objectified, tangible objects which are deemed evil in themselves. As stated by one critic, "This need for finding an objective correlative for fear will lead the community to focus its fear and hatred on the River Road, the tunnel, and on Sula for their perceived inherent evil while remaining blind to the mysterious and protean nature of evil" (Carmean 33). The community's ignorance regarding such abstractions is perhaps due to its unawareness of its own oppressed condition in relation to the rest of the world. In this sense, the people of the Bottom remain perpetually cut off or alienated from the world, left only with themselves and their own dubious judgment of good and evil.

Quite different from others in her community, Sula is a rebel in the Bottom—she is an individual who makes no commitments and abides by no rules of any kind. She is an unpredictable girl, neglecting the expectations that the community places on her as a citizen of the Bottom. Sula's individuality and detachment from morals can partly be accounted for by two experiences she has at the critical age of twelve. When Sula hears her mother saying, "I love Sula. I just don't like her," a significant bond between Sula and Hannah is severed, making Sula realize her own difference from her mother (36). Chicken Little's death, which immediately follows, leads Sula to become absolved of personal responsibility. She merely showed concern for her friend Nel's statement, "Somebody saw," and when she gets away "clean," she loses something central to her becoming whole (61). Sula has no center, nothing that may guide her through life. As clearly stated in Sula:

> ever since her mother's remarks sent her flying up those stairs, ever since her one major feeling of responsibility had been exorcised on the bank of a river with a closed place in the middle. The first experience taught her there was no other that you could count on; the second that there was no self to count on either. She had no center, no speck around which to grow. (118-119)

Sula later irritates the community of the Bottom with her refusal to accept a woman's role. Sula seems to do just as she pleases, and she behaves "like a man. She's adventuresome, she trusts herself, she's not scared. And she is curious and will leave and try anything" (Stepto 487). But what did Sula do to attract the reputation of "devil" and "pariah" (117, 122)? She places her grandmother Eva in a dilapidated nursing home, is spiteful toward the community, and engages in sexual intercourse with various married men. The rest is rumor and myth.

Although Sula's rationale for putting Eva in the nursing home is self-defense, the community sees it strictly as an act of evil. Because Eva shows much disagreement with Sula regarding Sula's life, Sula fears her. Sula expresses this fear to Nel, but similar to the rest of the community, Nel refuses to believe the rumors that Eva had murdered her son. The act of placing Eva in the old, run-down nursing home was perceived with disdain by the community as a whole, and triggered the spreading of many harsh rumors about Sula.

Sula's promiscuity with neighborhood men was not the sole cause of the community's contempt for her sexuality. The women of the Bottom see Sula's sexual intercourse with their husbands as a mockery of themselves and of the entire community. Unlike her mother Hannah, who simply couldn't do without some "touching every day," Sula antagonizes the women of the Bottom by sleeping with their husbands (44). Karen Carmean compares Hannah with Sula in this regard: "Hannah's sexual acts did not antagonize the women of the Bottom. The difference stems largely from Sula's refusal to flatter male egos and thus seemingly devalue the men and, by extension, their wives" (Carmean 39). Sula's lack of genuine affection and intimacy for her male partners is perceived by the community as mockery and disrespect.

We can understand Sula's inability to empathize by referring to her childhood experiences. Sula's free-flowing individuality had set her apart from the rest of the community. When she learns that "there [is] no other that you [can] count on," Sula loses all motivation to cultivate strong inter-personal relationships. Even Nel cannot rely on her best friend in Sula, and Sula finally admits to Nel that their friendship never "mattered" (144). The only person that Sula ever cares for is Ajax, a man who admires female independence. However, even in this case Sula is unable to understand the other, and when she invites him to "lean on her," Ajax' affection for her dissolves (133). The sexual act actually becomes for Sula an act of self-exploration and affirmation. Her sexual partner is practically unimportant; he merely serves as the medium to her personal fulfillment, "the postcoital privateness in which she met herself, welcomed herself, and joined herself in matchless harmony" (123). Sula's inability to find common understanding with anyone even during the act of sex demonstrates her complete inwardness and alienation from inter-personal relationships.

The question immediately arises: If Sula offers no genuine intimacy towards her male partners, then why are men constantly drawn toward her? Sula challenges men with her capriciousness. Sula herself seems "beyond good and evil" and seems without a superego or conscience. This, coupled with her capriciousness, gives her a strange and amoral innocence, even as she violates communal laws. Sula's innocence is denoted during her death, when she assumes the fetal position: "that she might draw her legs up to her chest, close her eyes, put her thumb in her mouth and float over and down the tunnels…and she would curl into its heavy softness and it would envelop her…" (149). Sula's free spirit is an inviting challenge to her male partners, who seemingly desire to gain control over her. These men soon realize failure, for Sula "tries them out and discards them without any excuse the men can swallow" (115). These men are left feeling both rejected and defeated, as are their wives.

When the community finds out that Sula had placed Eva in the nursing home and that Sula had mocked the town through her sexual practices, they begin to see her as a malicious, evil woman. The gossip that spreads soon incites rumors about her, which ultimately leads to her reputation as a devil. Sula's character shifts from the free-spirited rebel who scoffs at her community to the manifestation of evil. Sula is mythologized after returning to the Bottom, for in all her opposition and spite for the community she seems like a stranger or an outsider. The selection of the victim is explained by René Girard:

> The victim is a person who comes from elsewhere, a well-known stranger. He is invited to a feast which ends with his lynching. Why? He has done something he should not have done; his behavior is perceived as fatal; one of his gestures was misinterpreted… If the stranger behaves in a strange or insulting way in the eyes of his hosts, it is because he conforms to other customs. Beyond a certain threshold of ethnocentrism the stranger becomes, for better or worse, truly mythological. The smallest misunderstanding can be disastrous. (1986 32)

The community's victimization of Sula is irrational, for it is founded on a bias and created from fiction and myth. Although the community will not form a lynch mob against her, Sula is condemned because she is seen as different, and because the community wishes to alleviate its fears through displacing their guilt upon her. As Girard points out:

> The less rational the persecutors' conviction the more formidable that conviction becomes… Admittedly, scapegoats cure neither real epidemics nor droughts nor floods. But the main dimension of every crisis is the way in which it affects human relations. A process of bad reciprocity is its own initiator; it gains nourishment from itself and has no need of external causes in order to continue. As long as external causes exist, such as an epidemic of plague for example, scapegoats will have no efficacy. On the other hand, when these causes no longer exist, the first scapegoat to appear will bring an end to the crisis by eliminating all the interpersonal repercussions in the concentration of all evildoing in the person of one victim. (1986 43)

Sula thus becomes the repair for the dysfunction and sufferings of the people of her community, and she ultimately becomes a mythologized human sacrifice.

The mytholization of Sula becomes a demonization reminiscent the witch trials of seventeenth century Europe, which is historically known to be a large-scale case of society's creation of a scapegoat. The citizens of the Bottom use Sula's physical characteristics as a means to demonize her. The most conspicuous aspect of Sula's appearance is the birthmark over her eye. Nel, who generally avoids involvement with the community's victimization, considers the birthmark a stemmed rose. However, the rest of the community regards it as something quite sinister, referring to it as "that evil birthmark" (115). The birthmark is also called a "rattlesnake," indicating that the community sees her as a sort of evil trickster or temptress (104). Perhaps the most damning interpretation of the birthmark was by Teapot's Mamma, who saw it as "Hannah's ashes marking her from the very beginning" (114). Although the birthmark is merely a natural genetic flaw, it serves the community as another reason to condemn her. In the same way, the community builds further evidence that Sula is a devil by considering other "peculiar" aspects of her physical appearance. The rumors spread quickly that "Sula did not look her age. She was near thirty and, unlike them, had lost no teeth, suffered no bruises, developed no ring of fat at the waist or pocket at the back of her neck… she was free of any normal signs of vulnerability… when she drank beer she never belched" (115). The community judges Sula on the fact that she seems inhuman, that is, invulnerable to the signs of suffering and ugliness that plagues the entire community. Hence, they identify her as being otherly and inherently evil.

More rumors were spread by the citizens of the Bottom. They remembered the plague of robins that had accompanied Sula's return and considered it to be the work of Sula's evil magic. The community was also convinced that Sula had simply watched as her mother burned to death, showing no concern whatsoever. The community blames Sula for Mr. Finley's death, when he "saw Sula, choked on a bone and died on the spot" (114). When it was found out that Shadrack, a rejected citizen in his own right, had tipped his hat to Sula, they were called "two devils" (117). One of the most compelling rumors involved Sula's alleged engagement in what was considered taboo by the citizens of the Bottom—Sula's sexual relations with white men. The community felt that "there was nothing lower she could do, nothing filthier…They insisted that all unions between white men and black women be rape; for a black woman to be willing was literally unthinkable" (113). It must be noted that these particular forms of evidence were not required by the community to deem Sula a witch, but are rather the arbitrary results of Sula's victimization. These particular rumors themselves are not crucially important, for the community would eventually accumulate enough evidence to pass judgment on her as a demon, no matter what form the rumors took. Sula is condemned to become the scapegoat simply by her rebellious nature toward the Bottom; her erroneous mytholization as a demon is merely the community's means of shifting guilt and blame onto her.

There are some fascinating parallels between the mytholization of the scapegoat in Sula and the witch craze of seventeenth century Europe. Although the scapegoats were created for different reasons, both cases include a variety of erroneous, mythical claims made against the victim in order to render the victim 'otherly' and 'inherently evil.' Just as Sula was considered dangerous by her community, so did many Europeans claim that witches posed a threat to the safety and well-being of Europe: "They can make men or women love or hate each other, they can be-witch and take the life of men or women, and

BEST COPY AVAILABLE

likewise they can make spirits either to follow and trouble persons" (James 45). The witches were also thought to have the physical mark of evil on their bodies, what was known as the "devil's mark." While Sula's birthmark served this purpose, the witches allegedly receive the devil's mark on their bodies during a pact made with the devil. Thus, any woman with a peculiar mark on her body was subject to accusations of witchcraft. The witches also allegedly engaged in what was considered the most treacherous sin anyone could possibly commit: sexual relations with the devil himself. A witches' sabbat is described as:

> a lurid affair attended by numerous witches who flew in from considerable distances on broomsticks, shovels, spits, or a variety of domestic animals… The devil might appear to his congregants… Generally, the proceedings began with the witches kissing their master's rear…Incest and homosexual intercourse were encouraged. Often the devil would climax the proceedings by copulating. (Klaits 267)

This is comparable to Sula's professed sexual relations with white men, who are regarded by the Bottom as evil tricksters or devils, as shown by the "nigger joke" parable (4). Sexual relations with those who are intrinsically evil leads the witches and Sula to be considered also wholly evil. Thus, rumor and myth allow seventeenth century Europe and the community in Sula to create the scapegoat, an object of evil who carries the burden of the societies' guilt.

Interestingly, the displacement of guilt and hatred onto Sula actually works in temporarily strengthening the inter-personal relationships in the Bottom. When the community blames Sula for Teapot's broken arm, Teapot's "failure" of a mother becomes "the most devoted mother: sober, clean and industrious" (114). Other mothers also became more conscientious, for they "defended their positions as mothers from Sula's scorn for the role" (153). The conviction of Sula's evil leads the town to become more unified as a whole: "Once the source of their personal misfortune was identified, they had leave to protect and love one another. They began to cherish their husbands and wives, protect their children, repair their homes and in general band together against the devil in their midst" (117). Just as separate countries may form an uneasy alliance against a threatening enemy, so does the community come together to defend their own "righteousness" from the menace of Sula's evil. Sula serves the purpose of pharmakos right up to her very death, after which the community "returned to a steeping resentment of the burdens of old people. Wives uncoddled their husbands; there seemed no further need to reinforce their vanity" (154). Without Sula to carry the guilt of the community, the Bottom naturally returns to its previous dysfunctional state.

In Toni Morrison's Sula, the dysfunctional and fearful community of the Bottom mitigates its fears by objectifying evil in mythologized yet tangible scapegoats. Since Sula's actions are rebellious and mocking in the eyes of her community, she eventually becomes one of these scapegoats, defined as a demon or witch who is a pernicious threat to the community. It would be too simple to say that either the community or Sula is completely guilty for Sula's condemnation, for both sides contribute to causing it. However, the community's ineptitude for dealing with abstract concepts such as the nature of evil can ultimately only prove destructive. While Sula's victimization may have served to temporarily "cure" the sociological disposition of the community, the community's need to objectify evil in mythologized, tangible forms never truly solves anything, and only maintains the community in a state of perpetual blindness to the essential nature of evil. The citizens of the Bottom live unexamined lives in this respect, and seem content with achieving a false sense of security by transferring their inherent guilt onto something external instead of accepting responsibility for themselves and their community. Is Toni Morrison critiquing the African-American community in Sula? It would seem so. However, Morrison could also be depicting the African-American populaton as a victimized community that, like Sula, has been oppressed, condemned, and finally shattered.

The Search for Innocence in the Art of Jean Cocteau

Erin Nicole Parisi

Plan II Honors Program
University of Texas at Austin
W.C. Hogg 4.104
Austin, Texas 78712-1205

Faculty Advisors:
Alexandra Wettlaufer and Jonathan Bober

From August 29th to November 1, 1997, the Huntington Art Gallery of the Jack S. Blanton Museum of the University of Texas at Austin will house the exhibition entitled, *The Search for Innocence in the Art of Jean Cocteau*. The following document is an excerpt from the exhibition's proposal.

EXHIBITION GOALS

The purpose of this exhibition is:

A. To curate an exhibition on Jean Cocteau using original source material from the University of Texas' vast holdings.
B. To raise public awareness of Jean Cocteau and the Blanton Museum
C. To satisfy Severin Wunderman's $3 million gift contract with the Blanton
D. To bring attention to the new campus museum that will contain a gallery dedicated to the Wunderman-Cocteau Collection
E. To promote the Austin performance of Philip Glass' version of *Les Enfants Terribles* scheduled to be performed on November 4, 1997 in Bass Concert Hall

EXPLANATION

The Frenchman, Jean Cocteau (1889-1963), was a true poet. He believed in and modeled himself after the Greek definition of "poet" in which the poet is equal to the creator. Cocteau's ultimate state of being was being an active poet. He created fanciful poetic drama in every facet of his life and art. A Renaissance man of art forms, Cocteau transformed his own poetic language into many diverse media including poems, novels, plays, essays, drawings, and films. Cocteau's work is controversial and has been called many things from outlandish, vulgar, sensitive, erotic, heavenly, to revolutionary.

As an artist, Cocteau continually sought to astound his audience by whatever means necessary. Cocteau was the complete antithesis of Flaubert who believed that "*...the artist must make posterity believe he never existed.*" Cocteau hungered for attention and directed it onto himself by fully integrating his life and art. He chose to exist on a plane between dreams and reality believing that art is "*...an accumulation of visions and sensations.*"

The exhibition, *The Search for Innocence in the Art of Jean Cocteau*, will focus on Cocteau's art relative to the theme of youth as it is deeply influenced by his addiction to opium and his religious beliefs. This exhibit highlights Cocteau's work from 1919-1935 and 1950-1963. The first period will discuss Cocteau's addiction to opium after the death of his friend and lover, Raymond Radiguet, by focusing on three series: *Jean L'Oiseleur*; *Les Enfants Terribles*; and the *Opium Series*. The second period will highlight the chapel frescoes at Villefranche-sur-mer, Menton, and Milly.

BEST COPY AVAILABLE

It is important to understand that Cocteau repeatedly deals with the theme of innocence throughout his life in a variety of media. Cocteau's "innocents" are the characters he portrays as foolishly trustful or free from all evil. Cocteau admires the quality of innocence in all humans, but he attributes these traits mostly to children. Cocteau exploits the innocent by coloring them with his own views. He ingests mind altering drugs or interjects religious dogma. The manner in which Cocteau presents youth changes in relation to his own psychological development. When he takes opium, his innocents are gritty and raw characters. When Cocteau focuses on God, his representations of youth become cleaner and more joyous. The result is an interesting body of artwork that shows the spiritual evolution of one man.

Cocteau investigates questions of humanity by searching for innocence. Cocteau stands out as an individual and as an artist because his approach to these conventional questions is unconventional. Cocteau rejects his privileged upbringing, choosing to live an alternative lifestyle as a homosexual and drug user. Yet by the end of his life, he finds it necessary to reconcile himself with God and through his belief in Catholicism. Cocteau strives for immortality by finding redemption in religion and art through the theme of innocence.

Driven by an unending need to find his true identity, Cocteau is obsessed with escaping the present moment. Purposefully, he diverts himself from normal time searching for innocence. As a young man, Cocteau distorts his own vantage point by smoking opium to transcend from his normal view point. Later in life, Cocteau reconciles himself with Christianity while dwelling on his own mortality and eventual death. In both cases, Cocteau tries to abandon the present, believing he can try to understand life by being apart from it. This leaves Cocteau in a constant state of flux which provides him with a wealth of creative subject matter. Cocteau believes that, "*Art is the child of a kind of incest, the lovemaking of self and self, a parthenogenesis...all of us contain in ourselves a night we scarcely know or do not know at all. This night tries to emerge from us, yet resists emerging. That is the drama of art, a real struggle....*" By escaping actual time, Cocteau felt like he could find his "*night*," his inner source of innocence.

Cocteau's fascination with childhood can also be thought of as an adult in search of his own lost innocence. The majority of Cocteau's work deals with children or childlike emotions. Cocteau is intrigued by the simplicity of a child's life. Cocteau explores the stereotypical naughty and nice child. For example in *Les Enfants Terribles*, thought to be his most famous work, Cocteau pairs a strong female child with a weak, impressionable brother. He reveals their co-dependence, strengths and weaknesses. Cocteau admires the minds of children. In his own words, "*Childhood knows what it wants. It wants to emerge from childhood. The trouble starts when it does emerge. For youth knows what it does not want before it knows what it does want. But what it does not want is what we do want.*" The characters in *Les Enfants Terribles* exemplify this instability of youth.

Cocteau's art is dominated by religious imagery. He focuses on the pagan gods of the Greeks as well as the Christian God. He believes, "One must envision art as a priesthood." Toward the end of his life, he undergoes a Catholic reconciliation. He does this to face his own fear of death. Cocteau is uncertain of what the afterlife will bring, so he comes back to the Catholic Church of his youth. This change in personal philosophy also brings about a dramatic change in his art. Cocteau begins to paint frescoes on churches in the south of France. One of the churches he adorns with his work is located in Villefranche-sur-mer, a church that Cocteau had spent much time in as a young child. His motivations for painting the religious frescoes were two-fold. Cocteau desires to inspire the fisherman's children, the innocents, to think and dream of a higher power like God. Second, Cocteau studies and copies the works of art masters like Giotto, Mantegna and Michelangelo. By leaving murals on the walls, he feels that he is gaining immortality.

EXHIBITION CHECKLIST

YOUTH	
L'Enfant Terrible	Pen and ink on paper
Tete d'enfant	Pastel on gray paper
Jeunesse de Tolstoi	Brown crayon and black pencil on paper

Villefranche-sur-mer	Lithograph

EVENTS

The following are suggested events to take place in conjunction with Gallery Exhibition:

Screening of the Film *La Voix Humaine* -Introductory Lecture By Dr. Penny Marcus

Screening of other Cocteau films from Blanton Museum Collection with Les Enfants Terribles, Les Parents Terribles, Orphee and La Belle et La Bete

Noon Gallery Talk with Dr. Jean-Pierre Cauvin on *Cocteau and his Contemporaries*

Noon Gallery Talk with Alex Wettlaufer on *French Art and Culture Early 20th Century*

Noon Gallery Talk with Dr. Christopher Middleton on *Poets and Poetry*

Voix Humaine or scene from *Les Enfants Terribles*)

Playing of music in Gallery by local Erik Satie master Jehan Mitchell or other UT musicians

Preferences of Positive Reinforcers Among Elementary Students

Kelly Schutte

Department of Education
Indiana University at Kokomo
2300 South Washington
Kokomo, IN 46904

Faculty Advisor:

Lian-Hwang Chiu

The purpose of this study was to determine the preferences of positive reinforcers among elementary students. A sample of 346 fourth and fifth grade students was given a questionnaire in which each child rated different types of reinforcers. Each student also chose a reinforcer that he/she most liked and one he/she least liked. It was found that: (1) Primary and activity reinforcers were more preferred reinforcers; (2) Girls rated their preferences for primary, social and token reinforcers significantly higher than boys; (3) Students with grades of C/D rated their preferences for activity reinforcers significantly lower than students with grades of A/B or B/C; (4) Of the twenty reinforcers, the five most preferred were sundae party, coke break, game day, extra recess, and good grades; the five least preferred were progress charts, telling parents about good behavior, stickers, compliments to the student, and candy. The results could be applied by teachers when selecting positive reinforcers.

INTRODUCTION

Positive reinforcers have been used in the elementary classroom as a motivational strategy, according to Paul Chance. Chance adds that it is frequently the teacher that chooses what the reinforcers will be and the instructor makes these choices based on what he/she believes the students prefer. However, the positive reinforcers that the teacher chooses may or may not reflect the true preferences of the student and in order for reinforcers to be effective, they must be, "relevant and meaningful to the child" (Thompson, 1978). The purpose of this study is to determine the preferences of positive reinforcers among elementary students. More specifically, this study was conducted to address the following questions:

1. Which types of positive reinforcers were most and least preferred by the students?
2. Were there any differences of preferences of reinforcers between boys and girls? Among A/B, B/C, and C/D students, were there any

differences in preferences?

3. Which specific reinforcers were the most liked and least liked by the elementary students?

METHOD

Subjects

The subjects in this study consisted of 178 male elementary students and 168 female elementary students. The sample was drawn from several school districts in central Indiana. Included in this sample were 16 classes of fourth and fifth grades. There were 8 classes at each level.

Instruments

A twenty item questionnaire was used. Four different categories of positive reinforcers (primary, token, social, and activity) were used in statements such as, "I would enjoy earning good grades as a reward." Each statement was rated by the students on a four point Likert scale which ranged from "strongly agree" (4) to "strongly disagree" (1). The total range possibility, for each child in each category was from 5 to 20. The lower scores show a general dislike in the reinforcers.

Also included as a means to check response consistency, were two open ended questions. Each child was asked to choose one reinforcer from the list that was his/her favorite and state the reasoning behind this choice. Each child was also instructed to choose the reinforcer that was the least desirable to him/her and state the reasoning for that choice.

Procedure

The teachers of the 16 selected classrooms administered the questionnaires to their classes. The questionnaires were compiled and subdivided into six categories as seen in Table 1.

Table 1: Number of Students in Each Category

CATEGORIES	NUMBER OF FEMALE STUDENTS	NUMBER OF MALE STUDENTS
A/B Students	107	90
B/C Students	50	71
C/D Students	11	17

Among the subdivisions, the ratings of the statements were totaled according to type of reinforcer and the mean and standard deviation were calculated. The open ended questions, most liked and least liked reinforcer, were ranked based on frequency for each reinforcer. The rankings were compared within the subdivisions of male/female and A/B, B/C, and C/D students to determine which reinforcers were the most liked and which ones were the least liked. The written responses to these questions were also reviewed to provide more insight. Together, the statistics from the twenty questions, the rankings of the most and least liked reinforcers and the responses were compared to determine preferences of these positive reinforcers among elementary students.

285

RESULTS

Categories of Reinforcers

Inspection of Table 2 revealed that the most preferred categories of reinforcers were activity and primary reinforcers; the least preferred were social and token reinforcers. The means for each category of reinforcer, based on responses by each subgroup, is presented in this table. A 2 X 3 (sex x grade) ANOVA was performed for each category to test whether there were any significant differences.

Table 2: Means of Reinforcers Preferred by Fourth and Fifth Grade Students

TYPE OF REINFORCER		A/B	B/C	C/D
ACTIVITY	Male	16.69	17.44	15.35
	Female	16.52	16.50	15.82
PRIMARY	Male	16.98	16.53	14.88
	Female	16.91	16.94	17.00
SOCIAL	Male	14.47	13.56	13.00
	Female	14.73	15.18	14.18
TOKEN	Male	14.69	14.13	13.71
	Female	15.50	15.42	15.82

The results of ANOVA for activity reinforcers showed that there were no significant difference in preference ratings between boys and girls. However, C/D students' ratings were significantly lower than A/B and B/C students. (F= 6.56; df= 2, 340; P <.01).

The results of ANOVA for primary reinforcers showed that girls' preference ratings were significantly higher than boys (F= 5.41; df=1, 340; P < .05) and that there was no difference among students with A/B, B/C, and C/D grades.

The results of ANOVA for social reinforcers indicated that there was a significant difference in preferences with respect to gender. Girls rated social reinforcers higher than boys (F= 5.29; df= 1, 340; P < .05). Again, no difference was found among A/B, B/C, and C/D students.

The results of ANOVA for token reinforcers indicated that girls were significantly higher in their preference ratings than boys (F= 14.66; df= 1, 340; P <.001). Students with A/B, B/C and C/D grades showed no difference in their preference ratings.

Most and Least Liked Reinforcers

Table 3 shows the frequency of each specific reinforcer that was mentioned as most liked and least liked. The five most liked reinforcers are sundae party, coke break, game day, extra recess and good grades. The five least liked reinforcers are progress charts, telling parents about good behavior, stickers, compliments to the student, and candy.

Table 3: Frequency of Each Reinforcer

REINFORCER	Frequency for most liked	Frequency for least liked
1. stickers	1	36
2. student of the month	11	8
3. watching movies	14	10
4. cookies and milk	10	20
5. good grades	25	11
6. call parents	6	52
7. extra recess	25	5
8. coke break	62	2
9. certificates	2	9
10. letters of praise	2	21
11. eat lunch with teacher	18	20
12. popcorn party	0	19
13. end of the year award	10	5
14. words of praise	1	12
15. play games	2	4
16. sundae party	88	0
17. progress charts	7	73
18. compliments from teacher	5	40
19. game day as a class	46	11
20. candy	11	24

The correlation between the frequency scores for the most liked and the least liked reinforcer was significant (r= -.74; df= 18; $P < .01$). Thus indicating that student responses were consistent.

CONCLUSIONS

In general, elementary students preferred activity and primary reinforcers to token and social reinforcers. As a group, girls rated their preferences of reinforcers higher than boys. The differences were statistically significant with respect to primary, social, and token reinforcers. Thompson's study also found that girls rated social reinforcers higher than boys. As a group, C/D students rated lower than A/B and B/C students in their preferences of reinforcers; however, the difference was significant only for activity reinforcers. The Thompson study supports this finding. Based on students' choices, the five reinforcers they liked most were sundae party, coke break, game day, good grades, and extra recess. The five reinforcers they liked least were progress charts, calling parents about good behavior, stickers, compliments to the student, and candy.

The findings in this study may provide some guidelines for the teachers who would apply positive reinforcers in their teaching and learning activities.

Implementation of Civil Rights Policy in Education

Autumn Stewart

Department of Political Science
University of Toledo
Toledo, OH 43606

Faculty Advisor:
Carter A. Wilson

Although equal education opportunity continues to be a goal in the process of attainment, public education is the arena where civil rights legislation has been implemented the most successfully. In 1985, the United States was in a three-way tie for second place among sixteen nations in a study for spending on all levels of education at the figure of 6.8 percent of national income (Cochran 1995, 292). However, more is spent by the United States on post-secondary education than in any other nation. This leaves our K-12 institutions at a gross disadvantage especially when factoring in the redistributive nature of resources which has been a detriment to minority education. For this K-12 population, "the United States spends less than all but two of these [sixteen] nations" (Cochran 1995, 292). According to Pierre Bourdieu, this disparity in our educational system has made it the leading factor, beyond family, church, or workplace, to determine the transmission of social stratification across generations (Cochran 1995, 297). The historical implementation of civil rights legislation is discussed through major Supreme Court decisions and Congressional acts concerning school desegregation. Then, the future implementation is determined through analysis of what needs to be and has been done and the aim in this process.

SCHOOL DESEGREGATION

In order to discuss the implementation of policies with regard to civil rights policy in education, the major decisions and acts need to first be outlined. *Brown v. Board of Education* (1954, 1955) called for the desegregation of schools which had been segregated by state or local statutes. The Civil Rights Act of 1964 authorized the active pursuit of desegregation through litigation, negotiation, and fund termination by the Justice Department and the Department of Health, Education, and Welfare (HEW). *Green v. New Kent County School Board* (1968) required the elimination of dual schools. *Swann v. Charlotte-Mecklenburg Board of Education* (1971) cited busing as an acceptable remedy. The Supreme Court found, in *Keyes v. School District No. 1* (1973), illegal segregation in a non-Southern school. In 1977, Congress began to use its appropriations powers to place limitations on busing by prohibiting federal authorities from requiring busing. Each of these decisions, and their individual effects, need to be explored in further detail to determine their specific impact on the implementation process for civil rights policy in education.

The school desegregation movement, beginning with the 1954 *Brown* decision, spearheaded the NAACP's efforts to attain equality of opportunity. The implementation of this decision has failed more miserably than it may seem when casually looking at the statistics. Racial integration on a school-by-school level has gained some ground, but students are often retracked at the classroom level. The success has also been limited, in part, by the two-faced mannerisms of the north. "Ironically, today the greatest degree of racial segregation occurs in the Northeast and the least is in the South" (Mickelson 1995, 292). Desegregation programs, if they are well-run, have been shown through research to benefit minority and majority children both academically and socially (Mickelson 1995, 292). Still today, implementation has largely

BEST COPY AVAILABLE

failed because most schools continue to be segregated by race, ethnicity, and class, and this has led to largely unequal education between these groups.

Success in the implementation of the 1954 *Brown* decision has also been limited by the lack of attention given to the family background of the student. Public policy dealing with desegregation, instead of focusing on the poor and minority children and their families as the ultimate sources of unequal school outcomes, directed its effort at the operation of the schools. Research has shown that schools have minimal effect when compared to family background, but the effect that schools do have in reinforcing the disadvantages of race and class are due almost entirely to the unequal, and still segregated education received by minorities.

The three sections applicable to education in the Civil Rights Act of 1964 greatly aided the implementation of desegregation policy. "The new legislation contained provisions that:

1. authorized the Justice Department to sue school districts on behalf of black students (Title IV)
2. authorized the Justice Department to join school desegregation suits filed by private plaintiffs (Title IX)
3. directed that institutions that segregated be denied federal funds (Title VI)" (Bullock 1984, 57).

No longer was the burden of desegregation placed on black parents with the financial resources and the bravery to battle both the system and white hostility. The vast resources of the Justice Department were better equipped to successfully challenge segregation than individuals' efforts could be. The obstacle of the long appeal process in the courts was finally overcome, in 1964, as the cutoff of federal education funds to unresponsive districts and federally sponsored litigation were authorized.

Green v. New Kent County School Board (1968) stated, for the benefit of uncooperative schools and in unmistakable language, that schools had "the affirmative duty to take whatever steps might be necessary to convert to a unitary system in which racial discrimination would be eliminated root and branch" (Bullock 1984, 58).

Swann v. Charlotte-Mecklenburg Board of Education (1971) stated that, despite the inconvenience it posed for some, students would be bused out of their neighborhood school districts to other districts in order to achieve the racial balance necessary to follow the letter of the law.

Keyes v. School District No. 1 (1973) upheld the double standard between Northern and Southern schools. *Keyes*, in failing to rule de facto segregation as unconstitutional, allowed the disparities between North and South to remain. The South has been held to a standard of eliminating substantial racial imbalance. The North, without regard for its more demanding standards placed on others, has resorted to the redrawing of school attendance zones and optional attendance zones in the local government to keep blacks and whites separated despite the intent of the law.

Congress impeded the implementation of equal education in 1977 through a series of legislative checks on the use of busing. In the wake of this legislation, HEW was prohibited from requiring schools to use busing to promote racial balance, and the neighborhood school concepts, leading to mostly segregated schools, were favored.

WHAT NEEDS TO BE DONE AND WHAT HAS BEEN SUCCESSFUL?

Seven guidelines need to be met, to some extent, in order for the successful implementation of civil rights policy in education to occur. First of-all, the policy's goals need to be clear. The most change occurred when the ambiguity of the objectives was partially resolved. HEW and the courts, as they specified more precisely what was required of the districts, had more success. The multiple objectives of policies such as ESAA need to be narrowed to a more direct, all encompassing goal that increases the chances for successful implementation. Secondly, standards for change need to be specified that are quantitative and can be measured. The subjectivity of measurements, such as the intent of the districts, allowed too much freedom of interpretation in districts that still received federal money such as ESAA funding. Third, although the effectiveness of HEW's Office for Civil Rights (OCR) is questionable, the presence of an enforcement agency is an asset to an implementation program. This requirement can not be effective alone, but it definitely can aid in implementation. Fourth, monitoring by OCR has had an impact on the districts within its jurisdiction. Its visits, inspections, and interviews allowed adjustments to be made more expediently when problems arose. Fifth, OCR, as a new agency, was committed to its goals and was filled with zealots. OCR's commitment needs to continue to be strengthened even as it ages. OCR's primary goal should not change over the years, and its primary purpose should not be its own maintenance as an existing agency. Sixth, presidential support needs to remain behind desegregation efforts for it to be equally successful on a national level. Pressure was first put on the South and on rural areas with less political clout, and it is not a coincidence that they are the most desegregated areas. As presidential support tapered off, the North and urban areas were not held to the same standards as the South and rural areas. Finally, federal involvement, more than just presidential support, in desegregation is important to its success. The more pressure a district feels from the federal government, the more willing it is to alter its programs. Largely due to this factor, the South has been more effective than the North at desegregation because they received this additional pressure from the federal government. Overall, implementation has varied greatly throughout time and across districts. Different combinations of the above factors have led both to times of great success and to times of minimal progress. (Bullock 1984, 75-86)

WHAT DO WE AIM FOR NOW?

John Rawls proposes the solution promising the greatest probability of success in equality of outcomes in education. He holds that "only those inequalities are justified which are to the benefit of the least advantaged. Only inequalities of position or resources that result in greater productivity and thereby provide greater benefits to all, may be justified" (Cochran 1995, 310). The only way to have truly equal outcomes in education is to delete "accidents of birth." This is especially true when accounting for the disadvantages of both race and class suffered by so many blacks in our society. In order for justice to prevail, the common good needs to be placed before individual liberties in education to benefit both our economy and our society as a whole.

Education is a fundamental part of the necessary action which is required to reverse the unequal footing that racial status causes in our society. Although many solutions are conscious of race, the goal should be total nondiscrimination both in law and in practice. "To be sure, in 1963, Dr. King told the world of his dream - a nation where his children would 'not be judged by the color of their skin but by the content of their character.' Dr. King, however knew that not judging by skin color was a goal and was not the entire route to progress" (Berry 1996, 58). Racial equality needs to be central to all policies implemented, especially in education, until society becomes color-blind and equality on the basis of race is accomplished without added effort or thought.

Jewish resistance to the Nazi occupation of Lithuania and Belarus during World War II

It is commonly believed that the Jewish population of Europe did not resist the Nazi genocide. However, there were many instances of armed resistance in both city ghettos and rural area. This research traces the development and effect of the earliest Jewish resistance in Lithuania and Belarus, two countries where independent Jewish resistance and partisan organizations first formed. Evidence suggests that potentially large numbers of Jews in those areas were not passive to the threat, but actively resisted the Nazi efforts at extermination.

Resource material has been obtained from published historical documents and surveys and from primary resource material authored by persons involved in resistance activities. Additional qualitative research was conducted by personal interviews with resistance participants during the researcher's travels in the areas studied.

This research studies four examples of Jewish resistance in Lithuania and Belarus. These include the resistance movements in the cities of Vilna, Lithuania and in Minsk and Glebokie, both in Belarus and the Jewish partisan movement based in the Nalibocki forest west of Minsk. For the purpose of this research, Jewish resistance is defined as any Jew taking up arms against the Nazis or their sympathizers or Jews actively involved in sabotage activities.

It is important to understand the circumstances surrounding the perceived passivity among Europe's Jews to the Nazi threat. Historically, European and Russian Jewry had been subject to grievous persecution, anti-Semitism and murder for centuries prior to the Nazis rise. From medieval times into the 20th century, hatred towards Jews was a common theme throughout Europe. Over the centuries, thousands of Jews had been murdered, expelled from their homelands or forced into ghettos in countries across Europe. In the early stages, Europe's Jews accepted their persecution by Nazi Germany as one more phase in their long history of European anti-Semitism.

On June 24, 1941, the city of Vilna, Lithuania was captured by invading German army forces. Vilna fell less than 48 hours after the commencement of the invasion. Despite summary executions and confinement of the cities Jewish population into two ghettos, life continued for Vilna's Jews at a somewhat normal existence. In September, 1941 the 10,000 residents of the medieval ghetto were taken away and shot.

There was a major difference between what happened in Vilna and other occupied cities where Jews were targeted for mass exterminations. In western European countries and in the occupied East, Jews would be transported hundreds of miles to extermination camps. By contrast, Vilna's Jews were executed in the Ponar woods, just 6 miles south of the city center. It was apparent only weeks into the occupation the fate that awaited the Jews of Vilna.

On January 23, 1942, during the same week the Wannsee Conference convened in Berlin to plan the Final Solution, representatives from Vilna's Jewish political and religious organizations allied into a resistance group named the Farinikte Partisaner Organizatsia, the United Partisan Organization. The FPO became the first Jewish resistance group organized in any Nazi occupied country.

The FPO's primary objective was organization of a ghetto revolt by its Jewish population against the Nazi occupiers. By the time of the FPO's organization nearly half of Vilna's 80,000 Jews had been executed. Still, the FPO did not gain popular support within the ghetto or succeed in convincing large numbers to join them. The Nazi-appointed Jewish council argued that armed resistance would only aggravate the situation and ultimately cause more deaths. This was a fatal assumption for in September, 1943 the Vilna ghetto was liquidated. About 200 FPO fighters escaped to the forests around Vilna by using the sewers as their route out of the city.

Despite its failure to incite revolt, the FPO engaged in an aggressive sabotage campaign against the Nazi occupiers. FPO members destroyed rail lines and blew up at least one German troop train. FPO members working in forced labor camps disabled hundreds weapons being assembled for the German troops in the camp factory. FPO saboteurs burned a warehouse containing 60,000 winter coats bound for the front and destroyed large quantities of fuel, ammunition and equipment vital to the German army. The FPO's sabotage campaign against the German army was arguably the most successful aspect of resistance carried on by any Jewish group during the war.

Perhaps the most important legacy of the Vilna resistance organization was its ability to spread the idea of armed resistance to other cities, most notably Warsaw, Poland. It was a direct result of notification from the Vilna FPO that alerted Jewish leaders in other cities to the Nazi threat and allowed for the establishment of resistance organizations in other locations.

Minsk, Belarus was captured on June 28th, 6 days after the German invasion of Russia. During the 3 year occupation, Minsk served as the capital of the Reich Commissariat Ostland, a geographic district that included the Baltic countries and much of what is now western Belarus. German General Wilhelm Kube was named Reichskommisar for the Ostland and governed from offices in Minsk.

Starting in July, 1941 Minsk's Jewish population was restricted to a ghetto. By the beginning of January, 1942 only 25,000 of the original 100,000 occupants of the ghetto remained alive. During the fall of 1941, an anti-German underground emerged in the city and began organizing escapes from the ghetto into the surrounding forests. Unlike in Vilna, where the FPO attempted resistance from within the ghetto, Minsk's Jewish population realized attempts at ghetto revolt would be futile.

Jewish escapees formed into a seven independent partisan groups aiming to assist further escapes from the ghetto. These seven partisan groups were instrumental in assisting in the escape of nearly 10,000 Jews from the Minsk ghetto. This was the largest number of Jews saved by any Jewish partisan group during the war.

In addition to assisting in escape from the Minsk ghetto, Jewish partisan groups played a prominent role in sabotage activities. In July, 1942 500 children from the Rotomskaya Street Jewish Orphanage were forced into a large excavation near the ghetto gate. While General Wilhelm Kube threw the children candy, German soldiers opened fire, killing the 500.

Jewish partisans were instrumental in planning the assassination of Kube. Kube, who called Jews "the main bearers of the partisan activity in the East", was killed in 1943 by a bomb placed under his bed by a woman partisan employed in Kube's headquarters as a domestic servant.

The Jewish resistance was not limited only to large city ghettos. A force of nearly 300 fighters used the Glebokie, Belarus Jewish ghetto as a base of operation. Glebokie is a small town located 150 kilometers northwest of Minsk.

In August, 1943, as a response to continued ghetto unrest and to prevent Glebokie's Jewish partisans from joining Russian partisan groups in the nearby forests, German army units surrounded the ghetto and ordered the remaining Jews to prepare for 'resettlement' transportation. The Germans were met with small arms fire and grenades. For three days, Glebokie's Jews fought against the Germans until finally running out of ammunition. The partisans set the ghetto on fire and attempted to escape to the forests. A small number was successful, but the majority was captured and executed.

In 1941, Tuvia Bielski, a Belarussian Jew, and 16 others, established a refuge in the Nalibocki forest west of Minsk for Jews fleeing the Nazis. The Nalibocki forest is the largest forest in eastern Europe and for much of the war served as a base of operations for many partisan groups operating in western Belarus and eastern Poland.

By 1943 the Bielski group had grown to nearly 1,500 Jewish men, women and children. The group functioned as a structured community hidden within the confines of the forest. It was divided into two segments: the Bielski Brigade and the Zhukov Detachment. The Bielski Brigade, comprised of skilled and semi-skilled individuals such as medical workers, blacksmiths, bakers and tailors operated as a support group for the larger Russian-backed partisan groups in the forest.

The Zhukov Detachment was militarily active throughout the war as adjunct fighters to the Russian partisans. They specifically targeted sympathizers known to have collaborated with the Nazis against Jews. Tuvia Bielski survived the war, immigrated to America, and in 1995 was awarded the inaugural Medal of Resistance from the US Holocaust Memorial Museum.

Research indicates the four examples studied were not the only instances of Jewish resistance to the Nazis. It has become increasingly clear that Jews in Lithuania and Belarus were

BEST COPY AVAILABLE

were not passive to the German threat but actively sought to resist the extermination attempts.

Research additionally revealed that as many as 20,000 Jews fought the Germans from partisan groups in these areas. Another 10,000 Jews survived the war by taking refuge with partisans. This 30,000 figure is relatively small compared to the total 6,000,000 Jews murdered by the Nazis but can be considered a significant number when compared to the approximately 800,000 Jews killed by the Nazis in the areas researched.

Despite these numbers, resistance Jews offered against the Nazis cannot be overlooked or minimized. Perhaps it can best be summed up by a quotation from the Talmud, the ancient commentary on the Jewish laws: "Whoever destroys a single life destroys the entire world, whoever saves a single life, saves the entire world."

Peddling Public Assistance: The Children's Bureau and the Aid to Dependent Children Program in the Social Security Act of 1935

When President Franklin D. Roosevelt addressed Congress on June 8, 1934, about the chief accomplishments of the New Deal, he eloquently claimed: "Among our objectives I place the security of the men, women, and children of the Nation first...the security of the home, the security of livelihood, and the security of social insurance are, it seems to me, a minimum of the promise that we can offer the American people" (*The Reports of the Committee on Economic Security* 136, 139). Shortly thereafter he issued Executive Order No. 6757 which allowed for the establishment of a Committee on Economic Security to make "recommendations concerning proposals which in its judgment will promote greater economic security" (*The Reports of the Committee on Economic Security* 140). FDR's initial vision of Economic Security excluded provisions for aid to a multiplicity of groups, including a public assistance program for women with dependent children. It was Katherine Lenroot, Grace Abbott, and Martha Eliot of the U.S. Children's Bureau who wrote Title IV, the Aid to Dependent Children program (ADC), and asked Edwin Witte, the Executive Director of the Economic Security Committee, to include it in the Economic Security Bill.

The Children's Bureau's advocacy for ADC was rooted in the inability of individual state welfare systems, known commonly as "mothers' pensions" programs, to provide for the dramatically increasing numbers of impoverished single mothers and children during the Depression. In addition to the absence of mothers' pensions in Alabama, Georgia, and South Carolina, the economic crisis within the nation caused pension program in Arkansas, Mississippi, and New Mexico to be discontinued or rendered inoperable (Report on the Social Security Bill 10-11). The Federal Emergency Relief Administration's (FERA) attempts to compensate for the disintegrating state mothers' aid programs were moderately successful, but FERA was unable to sufficiently reach all the families with great need. The Children's Bureau was therefore motivated to advocate a permanent federal public assistance program because by 1935 "there were more than three times as many families on [Federal Emergency relief] as there were receipt of mothers' pensions" (*Hearings Before the Committee on Ways and Means* 159). That the Social Security Act of 1935 contained ADC shows the Children's Bureau's success in moving the federal government to recognize single mothers and their children as a group in need of some type of permanent assistance.

Yet in the attempt to make ADC palatable to the government and to guarantee its passage, the Children's Bureau marginalized the program in its conceptualization. The primary causes of this marginalization were the Children's Bureau's maternalist perceptions regarding single mothers and their pre-conceived ideas about these mothers' moral classification. Therefore, the Children's Bureau emphasized to a Congress disinterested in ADC, but concerned with unemployment, that this program took "the housekeeping-mother approach to the care of children," arguing that supporting mothers in the home decreased women's competition with male workers (Berry 105). In addition to these imposed limitations, the Children's Bureau severely restricted the overall reach of ADC by stressing the greater importance of Title V, by making crude estimations of the number of families eligible to receive aid, and by reducing the amount of federal allocations needed to operate the program. Title IV was thus inhibited by both theoretical and structural deficiencies, limitations which have contributed to making it the most harshly criticized welfare program in the United States.

Maternalist ideas and attitudes toward single mothers and children in need were rooted in the beliefs of early twentieth century reformers. Single mothers had long been subjects of charity, pity, and moral discussion in the United States, although the designation "single mother" itself is a contemporary term. Reformers in the early twentieth century used more specific titles of widow, abandoned woman, unwed, or illegitimate mother, terms which hinted at the moral categories ascribed to these mothers. By the twentieth century most social reformers and feminists began to perceive this "problem" of single motherhood as a serious threat to the family and to the functioning of civil society. Most welfare advocates believed deeply in the moral family, which included a male breadwinner who provided means for his full-time domestic housewife and children. Social feminists too advocated the sphere of domesticity for women, arguing against mothers' employment because it took mothers out of the home and away from their child-rearing duties. Campaigns for welfare aid drew from these beliefs in the moral family and in cult of female domesticity, shaping the formulation and promotion of programs that aided single mothers and their children.

Welfare reformers and feminists indeed expressed genuine concern for the plight of single mothers, but many viewed deserted wives and unmarried mothers as the critical moral problem, and they allocated fault and determined worthiness with respect to relief (Gordon 25). Seeking to galvanize public support for welfare relief programs, social feminists in the early twentieth century de-emphasized the image of the immoral unwed mother by speaking exclusively in terms of providing aid to widows, since widows were blameless victims. In structuring the welfare dialogue around widows, the welfare reformers caused the stigmatization of unwed or deserted mothers to magnify, for in claiming the widow's innocence they insinuated the noninnocence of others (Gordon 27). While most reformers agreed that single mothers in general were victims of circumstance, what these reformers ultimately developed was a strict distinction between widows as the "deserving poor" and illegitimate mothers as the "undeserving poor."

These pre-conceived ideas regarding what "kind" of single mothers and families deserved aid pervaded what little dialogue occurred in the committee hearings and Congressional debate over Title IV. Of all the framers of ADC, Grace Abbott expressed succinctly how issues of the mothers' moral qualities were a central concern for the creation of a federal aid to dependent children program. In testimony before the Committee on Ways and Means on January 25, 1935, she reminded the board that ADC would assist people with strong moral fiber. She explained: "Usually the children are really nice children and the families are nice families" (*Hearings Before the Committee of Ways and Means* 496). Privately, Abbott's ideas regarding the distribution of federal aid evidence how resolute her pre-conceived biases toward particular single mothers were. She adamantly believed that "for successful administration of mothers' aid laws it is necessary to establish by investigation the need of the mother and her moral and physical fitness to maintain the home" (276). The Committee on Ways and Means did not question Abbott's assumptions, and included them in an April 5, 1935 report to the House. The Committee gave the states considerable leniency to "impose...eligibility requirements--as to means, moral character, etc.,--as it sees fit" when distributing ADC funds (*Report on the Social Security Bill* 24). The final draft of the bill did not include this provision verbatim, instead it couched the idea in a nebulous phrase, enabling the states to conduct "such other investigations as the Board may find necessary" (*The Reports of the Committee on Economic Security* 10).

Following the maternalist reform tradition further, the Children's Bureau and its supporters believed it to be crucial that mothers remained within the home and out of the work force. Considerable effort during the Depression was put forth in general to prevent women from entering the work force and many women with jobs were fired due to the emphasis of putting men to work. ADC thus became attractive to politicians in Congress worried about unemployment figure because it supplied financial assistance to single mothers' in the home with their children, theoretically preventing them from working in the public sphere. This emphasis upon keeping mothers within the domestic sphere asserted that supporting needy single mothers in the caring for their children guaranteed future economic and social security. Grace Abbott concluded that this argument summarized "the whole idea of mothers' pensions...that [funds] should be enough to care for the children adequately, to keep the mother at home and thus give some security in the home" (*Hearings Before the Committee of Ways and Means* 495).

In addition to their discussion of moral and employment concerns, the Children's Bureau limited the scope of ADC by placing greater emphasis upon other components of the Economic Security Bill. The Children's Bureau focused primarily upon Title V of the bill, which, similar to the defunct Sheppard-Towner Act, established a national program for child and maternal public health services. Historian Linda Gordon explains that "they [the Children's Bureau] had been agitating for this from very early on in Roosevelt's administration and ranked this program first in the recommendation they made to Witte" (257). The Children's Bureau regarded ADC to be a temporary supplement to this health services program, a belief reflected in how they deliberately separated ADC from the public health services program. As Grace Abbott indicated in her testimony before the Committee on Ways and Means, the basic measures of ADC were "to a very considerable extent ... a child welfare program" (493). Title IV in the Social Security Act of 1935 thus emerged as a timid and modest effort to provide financial assistance to single mothers and their dependent children.

When writing and presenting Title IV, the Children's Bureau and its supporters further restricted the overall reach of ADC by making very conservative and inaccurate estimates about the number of single mothers and children the program would aid. The framers insisted that ADC was designed to cover the unusual cases of need, which according to Title IV in the Social Security Act were children "under the age of sixteen who [have] been deprived of parental support or care by reason of the death, continued absence from the home, or physical or mental incapacity of a parent" (*Reports of the Committee on Economic Security* 11). The Children's Bureau's research revealed that "there were above 350,000 families on [emergency] relief, the head of which was a widowed, separated, or divorced mother and whose other members were children under 16" (*Report on the Social Security Bill* 10). However, the Committee on Economic Security agreed with Edwin Witte that not all of these 350,000 families were dependent (*Hearings Before the Committee on Ways and Means* 161). The framers of ADC therefore assumed "that half of the relief families [350,000] headed by widowed, separated, and divorced women with dependent children under the age of 16 years would be found eligible for aid to dependent children" (*Social Security in America* 248). Surmising that only 179,000 of these families would qualify for ADC, the Children's Bureau added to that figure the number of families, 109,000, receiving mothers' pensions. The Children's Bureau ultimately concluded from these estimates that 300,000 families at most were in need of ADC.

Why this modest estimation was used demonstrates the Children's Bureau's wish to keep the program small, avoid controversy, and guarantee ADC's passage. The purpose in exploring these limitations is not to reproach and vilify the ADC framers and supporters, but instead to indicate the structural deficiencies of Title IV. The Children's Bureau clearly and purposely remained silent about the number of unwed or abandoned mothers from their discussion of whom would qualify for ADC. Their exclusion of unmarried and deserted mothers from Congressional dialogue shows that a moral classification between deserving and undeserving poor remained a cogent perception for them. Thus, the absurdly low and inaccurate calculation of eligible families made by the Children's Bureau evidences "their desire to make [ADC] an elite assistance program, to serve only the deserving, perhaps even the exemplary" (Gordon 257).

Based upon this limited estimation, the grants-in-aid to states given by the federal government to administer ADC covered only one-third of the total expenditures, an inferior allocation when compared to other Social Security programs. The Children's Bureau chief, Katherine Lenroot, acknowledged to the Committee on Ways and Means that "the amounts of money included in the bill are very conservative," and that larger requests might well have been justified (263). The Children's Bureau thus estimated the total annual outlay for ADC to be $120 million, about $125 million less than what was then being spent to support the families currently on emergency relief and mothers' aid (Coll 104). The Children's Bureau and its supporters, however, never pushed for a greater allocation from the federal government. Few welfare advocates in Congress extended the arguments of Representative Robison of Kentucky, who argued that the Title IV measures were "grossly inadequate" and would indeed be a "great disappointment to the millions of needy children" (*Congressional Record* 5695). According to Edwin Witte, "that the grants to states for [ADC] were limited to one-third of their expenditures, while the grants for old-age assistance and blind pensions are for one-half of the expenditures, reflects this lack of interest [in Congress] in the aid to dependent children" (164).

Yet Witte's rationalization does not entirely absolve the Children's Bureau's failure to demand that the federal grants be changed to the one-half figure. Certainly the ADC framers and supporters faced a Congress with a "current political interest in the aged" (Abbott 229). That political reality was recognized by the Children's Bureau, and they understood that they had a much smaller constituency endorsing their cause. However, in spite of the excessive attention given to the aged, even detractors of the Economic Security Bill in Congress expressed support for a federal aid to dependent children program. Representative Treadway of Massachusetts voiced his opposition to Federal Old-Age Benefits, Unemployment Insurance, and Federal Income Taxes, but resoundingly affirmed his favor for Title IV (*Congressional Record* 5529). The Children's Bureau basically feared losing Congressional support and federal funds for their programs, for Title V especially, and therefore they "did not feel it was wise to raise the point" of challenging the one-third appropriation (Witte 165).

The one-third figure remained in Title IV when the bill was enacted in August of 1935. The provision went unchanged until 1939 when most of the programs in the Social Security Act of 1935 were amended. However, the limitations and deficiencies within the framework of ADC endured. The maternalist emphasis upon providing aid to mothers within the home to care for their children continued to be largely counterproductive. ADC payments were often insufficient, and in 1940 "three fourths of ADC mothers worked, most in part-time low-paying jobs" (Coll 119). The Social Security Act of 1935 and its multiple amendments have become the foundations for the welfare state, but the programs have subsequently made a distinction between public assistance and social insurance. This differentiation has enabled public policy to discriminate invidiously between categories of dependent people. The elderly, the unemployed, and the disabled worker may claim aid as a right of social insurance. However, women with dependent children in general have been "morally tarred" by their association with relief in the contemporary assistance program Aid to Families with Dependent Children (Katz 15-16).

In spite of the current problems with ADC, we must recognize that the program was part of a constructive effort by the Children's Bureau to create a firm foundation within federal legislation for the extension of public welfare to single mothers and their children. Edwin Witte admits that had the Children's Bureau not pressed the Committee on Economic Security on the issue of ADC, "nothing would have been done on this subject" (164). We must not minimize the achievements of the Children's Bureau and its supporters. Yet we must likewise acknowledge the theoretical and structural limitations they imposed upon their framing and promotion of ADC.

The Children's Bureau had a unique opportunity in 1935 to create a program for assisting single mothers and their children. In Europe and Scandinavia, reformers and welfare advocates expressed that there was an "endowment of motherhood," and they largely based the construction of their welfare states upon this idea. The preoccupation with the aged and the pervasiveness of pre-conceived beliefs toward single mothers, however, marginalized the U.S. Children's Bureau's conceptualization and institution of Title IV. In their efforts to promote the public assistance program, the Children's Bureau undeniably insinuated the relative inferiority of certain single mothers, imposed great limitations on the scope of ADC, and implied that there might indeed be a "deserving poor." Yet, Title IV of the Social Security Act of 1935 must be considered both a significant and a problematic beginning, and as Linda Gordon concludes: "Our task is to continue" (306).

Faculty Advisor:

Dr. Abdul Karim Bangura

This study examines the Tax Reform Initiative by Marylanders to ascertain why Prince George's County residents viewed the existing tax cap as an effective tool for holding elected officials fiscally responsible. The data collected for this study covered the seven month period before the November 5, 1997 election. The substantive findings from this research suggest that tax caps are justifiable and effective in Prince George's County which has even larger implications for the state of Maryland.

INTRODUCTION

Studies on tax reform in the United States have concentrated on the issues of tax limitations and public service finance (see, for example, Catterall and Thresher 1979, Picus 1979, Ladd and Boatwright-Wilson 1952, Brighton and Northup 1990, Miler 1969, Grasberger 1971, Newfeld 1977, Walker 1984, Day 1989). In their drive to build theories about tax reform, researches have utilized the case study approach to investigate the issue. This approach allows researchers to investigate a contemporary phenomenon within its real life contexts. Although the case study approach is very useful in examining a phenomenon, many times, it is too broad. This broadness does not allow for an examination of sub-levels within the phenomenon.

Thus, employing the same approach, this study examines the sub-level of tax reform. More specifically, it deals with tax caps as applied in Prince George's County, Maryland. This study seeks to examine the systemic aggregation of the inputs, outputs, and feedback offered by Prince Georgians' regarding the current tax cap. Tax cap issues have become increasingly important to voters locally and nationally. Many taxpayers feel that tax caps are justifiable because they force elected officials to be fiscally responsible. However, others feel that they are cumbersome, unnecessary, and severely restrict elected officials. This essay attempts to show how the electorate and elected officials feel about tax caps.

The major questions of this research are as follows: (1) Are tax caps justifiable and effective? (2) Why did the majority of Prince Georgians vote against the repeal of TRIM?

THEORETICAL FRAMEWORK

Systems analysis is the mode of study employed in this research. The primary components of systems analysis are the transformational process, inputs, outputs, and feedback.

The transformational process is the political system. The political system authoritatively allocates the values for society. Inputs into the political system include those of the actors who initiate demands and lend support. Demand is an expression intended to influence the political system so that the actor receives a favorable output which also favors his/her interests. Supports are the remaining transactions that exist after demands have been subtracted. Outputs are the authoritative decisions and actions of the system's leaders that bear on the allocation of values for the system (Easton:49). Feedback encompasses the response(s) of the people regarding government output. This feedback can be positive, which equals acceptance, or negative, which equals rejection.

299

RESEARCH MTHODOLOGY

The research methodology employed for this research is qualitative. Revenues gained by taxes provide for the economic stability of the county. However, taxpayers wanted to know whether removing the cap would provide for more efficient public services and lend to stability. For this essay, efficiency and stability are examination factors. The basic assumption is that there is a connection between the Tax Reform Initiative by Marylanders and Prince Georgians' perceptions of tax caps. More specifically, the underlying proposition is that there is a negative association between the Tax Reform Initiative by Marylanders and the current state of public service programs within the county. This proposition is testable because efficiency is examined in terms of the minimum waste and expense in current tax revenues and stability is examined in terms of continuous inputs into existing public service programs. Generality is achieved because the results of the November 5 election can be projected to predict future action on "like" issues. The Tax Reform Initiative is examined on a micro level because only Prince George's County is being examined.

INPUTS OF COUNTY RESIDENTS FOR THE REPEAL OF TRIM

Proponents of TRIM's repeal tried to influence the political system in Prince George's County so they could receive the favorable output of TRIM's repeal. Since the initial discussion regarding TRIM, many organizations lobbied for its repeal and promulgated continuous supports to persuade county residents to vote for its repeal. These organizations included the Prince George's Revenue Initiative Dedicated to Excellence (PRIDE), the Chamber of Commerce, several religious coalitions, and many others. Their arguments, in sum, were: (1) TRIM limits the flexibility of the county government to provide resources necessary to meet taxpayer expectations; (2) TRIM does not allow a rate adjustment to maintain county revenues in times when property assessments decline, and (3) TRIM does not allow county legislators to shift revenues by adjusting rates.

OUTPUTS OF COUNTY RESIDENTS FOR TRIM'S REPEAL

Many county legislators, members of the school board and the county executive contributed much action to facilitate TRIM's repeal. By their actions [both negative and positive], they hoped to influence the values of Prince Georgians' by convincing them that TRIM was wrong for the county. Before the November 5 election, the county executive outlined a $63 million spending plan that was based on TRIM's repeal. Curry's plan showed how the additional revenues would cost the homeowner, as represented in Table 1.

TABLE 1: ADDITIONAL REVENUES FROM TRIM'S REPEAL AND THE TELEPHONE TAX

TRIM's Repeal	Total Cost	Annual Cost to Homeowner	Total Revenues
Reallocations of current rates (*)			
(*) M-NCPPC	$ 6 cents	$0	$13 million
(*) Stormwater Management	$ 2 cents		
Rate Increases (+)			
(+) Affects all property taxes commercial and residential	$.12 cents	$65	$20 million
Telephone Tax			
All bills – commercial and residential	10%	$36 (1st $10/month exempt)	$30 million
		$101 a year $8.42 per month	$63 million

The figures in Table 1 show that the increased revenues would be raised by increasing the county's combined property tax rate by $.12 cents per $100 of assessed valuation and by creating a 10% tax on telephone service. The county executive estimated that this plan would cost the typical homeowner only $101 a year or $8.42 per month.

INPUTS OF COUNTY RESIDENTS AGAINST TRIM'S REPEAL

Opponents of TRIM's repeal also tried to influence the political system in Prince George's County so they could receive the favorable output of TRIM's continuance. In addition to the county residents who were opposed to TRIM, organizations such as the Truth iN Taxation Committee (TNT) and the Interfaith Action Committee offered tremendous support to prohibit TRIM's repeal. Their arguments, in sum were: (1) Voters should be given the authority to approve all new taxes and/or fees; (2) There should be a mandated guarantee that revenues raised for education and public safety will go to those entities; and (3) Hidden taxes [telephone and energy] should be discouraged.

OUTPUTS OF COUNTY RESIDENTS AGAINST TRIM'S REPEAL

On this end, there were also county legislators and many county residents who offered a significant amount of opposition to those in favor of repealing TRIM. These opponents of TRIM's repeal criticized PRIDE, the county executive and other legislators who pledged their support for TRIM's repeal. They also hoped to influence the values of the countys' taxpayers by convincing them that TRIM was advantageous for the county because if forced elected officials to be fiscally responsible for the current revenues. The opponents of the TRIM cap argued that: (1) the repeal of TRIM was unnecessary because county revenues had increased as the tax base within the county grew; and (2) raising the tax rate could drive away homeowners and businesses from the county.

FEEDBACK FROM THE LACK OF TRIM'S REPEAL

The feedback of proponents for TRIM's repeal was negative; however, the feedback of opponents against TRIM's repeal was positive. After a long political battle with continuous inputs and outputs by the opposing spheres, TRIM was not repeal on November 5. The results can be seen in Table 2.

TABLE 2: RESULTS FOR THE TAX REFERENDUMS

<table>
<tr><td colspan="4">Question B: To repeal the limit on the real property tax rate of the county and to require that any increase in the tax rate greater than the rate in effect in the prior fiscal year be approved by an affirmative vote of two-thirds of members of the full council.</td></tr>
<tr><td>% of Votes YES</td><td>% of Votes NO</td><td>Numeric # — YES</td><td>Numeric # — NO</td></tr>
<tr><td>36</td><td>64</td><td>76,325</td><td>119,054</td></tr>
<tr><td colspan="4">Question I: To provide that any ordinance or resolution levying or charging certain taxes or fees in excess of the amount levied or charged in the preceding fiscal year shall be referred to referendum of the qualified voters.</td></tr>
<tr><td>% of Votes YES</td><td>% of Votes NO</td><td>Numeric # — YES</td><td>Numeric # — NO</td></tr>
<tr><td>62</td><td>38</td><td>113,331</td><td>68,704</td></tr>
</table>

The figures in Table 2 show that Prince Georgians' failed to repeal TRIM and approved Question I. These figures show that county residents are serious about having control over how their tax dollars are spent. The feedback for opponents of TRIM's repeal was positive because many residents had reservations about the repeal measure from the initial debate. Their reservations included: (1) the ballot question did not specify that any increase in tax dollars would go to schools and public services; (2) Prince Georgians pay the second highest combined property tax rate in the state; and (3) [before the November 5 vote] elected officials appeared to have something to hide from the taxpayers because they were highly evasive when questioned about the repeal effort.

TRANSFORMATIONAL PROCESS OF INPUTS AND OUTPUTS

There were many societal organizations that sought to authoritatively allocate their resources of demand and support to sanction and prohibit TRIM's repeal. However, in spite of all their efforts, neither the proponents for TRIM's repeal nor the opponents for TRIM's continuance could implement their demands or supports because "government" is the only institution that makes binding decisions for society. Prince Georgians voted not to repeal TRIM on November 5 and, consequently, the county government — the county executive and the county legislature — must adhere to the mandate of the people and make decisions, possibly negative in their application, which would compensate for the shortfall in funds

CONCLUSION

The systems analysis framework, as identified by "inputs", "outputs", and "feedback" is a useful tool for comparing the manner in which the proponents for TRIM's repeal nor the opponents for TRIM's continuance formulated demands and supports to sanction or prohibit TRIM's repeal. This approach provides a rigorous and disciplined framework by which data can be methodically organized and interpreted. Thus, systemic aggregation of relevant information makes a genuine comparison between proponents and opponents' views on repealing TRIM.

At the same time, this paradigm must be criticized for its shortcomings and inadequacies. Systems analysis is too broad and generalized and does not follow the analysis of concrete subsystems such as cultural, social, and racial factors. More concrete tools must be developed to investigate these areas and the role they played in the failure to repeal TRIM. Despite its shortcomings, systems analysis proves to be a strong preliminary tool for comparing the opposing spheres of the TRIM debate.

This research sought to demonstrate that voters in Prince George's County, Maryland strongly believe that tax caps are, indeed, justifiable and effective because they force elected officials to be fiscally responsible and accountable to the taxpayer. Repeal of the tax cap would not have provided for substantial public service efficiency or stability because the additional revenues were not earmarked for any specific area. Prince Georgians realized that public service funds are severely deficient; yet, they were not willing to give elected officials the "go-ahead" to raise their taxes by an unspecified amount. Many of these residents would not give the green light to elected officials because the believed that they are wasting their money on items such as highly favorable pension packages and unwarranted wage increase for top county officials. Prince Georgians hold firm to the belief that the county government will never be satisfied with the amount of money if receives from the taxpayers. Thus, they sent the very strong message on November 5 that they [the voters] will keep a close tab on taxes and the re-allocation of those revenues.

Famous and Forgotten The Life and Death of *The Dubuque Dial*, 1934-1935

Michael Anderson

In June of 1934, a radical literary magazine came off the presses in a small town along the Mississippi The editor, Karlton Kelm, at the age of 25, launched one of his biggest experiments, *The Dubuque Dial*, a literary magazine publishing short stories Although Kelm chose an unlikely city for the unveiling of a literary experiment, the time was right Out of nationwide despair, rose a plethora of writers energized by the need to document and understand the unprecedented tragedy of the Depression. The emergence of social protest literature in 1932 was one literary movement that catalyzed writers Many writers immersed in the trauma of the human condition during the Depression were influenced by Marxist ideology, cultivating themes of economic determinism, class struggle, capitalist decadence, and proletarian revolution.[1]

In this radically changing literary world, Karlton Kelm emerged as both writer and editor At the age of 25, Kelm had appeared twice in *The American Mercury*, and in 18 magazines Kelm's decision to launch *The Dubuque Dial* in 1934, in the unlikely city of Dubuque, at the height of the Depression, was only one color on Kelm's literary palette In 1936 Kelm published two novels, *The Cherry Bed* and *Brother*. The young editor also came close to having a play, co-written by his brother, produced on Broadway Despite his ambitions as a playwright, Kelm entered the world of the editor with the publication of *The Dubuque Dial*.[2]

Yet unlike many other editors, Kelm dared to hope that small town neighbors and local farmers, themselves only half-alive, might find new energy in radical literature. Kelm's original idea was to publish only Iowa writers Despite the new literary atmosphere the Depression created, however, Kelm's success was uncertain from the outset. Part of his success depended on acceptance of his experiment Kelm, however, was pulled by his own literary ambition, as well as the need to have his experiment accepted by his literary peers and the general public While Kelm kept one eye on his own literary ambition, his other eye watched for a response to his newest experiment Kelm's hope rested in the words of his literary peer, Josephine Herbst, "There is room for many kinds of writing in this country, or there ought to be."[3]

Although Kelm ultimately abandoned his original idea to publish only Iowa writers by the second issue of the magazine, he continued to attempt to introduce the Midwest as a new player in the literary world Many of the writers included in the magazine, such as Meridel Le Sueur, possessed both Midwestern origins and literary fame, enabling Kelm to tickle the pride of the community while satisfying literary critics.[4]

The content of *The Dubuque Dial* also seemed to attempt to appeal to a more general audience Although the magazine's more obvious themes related to the Depression itself and proletarian literature, *The Dubuque Dial* also represented other issues stemming from Depression life Themes relating to class conflict, the plight of women, and living in the moment all occupied a significant place in the magazine As K.C Shelby wrote to Karlton

Kelm, "I know, too, that *The Dubuque Dial* is not, strictly speaking, a proletarian magazine."[5] Many of the themes in *The Dubuque Dial* were not purely proletarian, on the other hand, themes such as social class tension often stemmed from proletarian issues.

The proletarian issues found in the magazine tended to vary in perspective. For example, Josephine Herbst seemed to place hope in the working class citizen's ability to survive the suffering and misery of life. In her story "You Can Live Forever," Amos Wendel, a worker, was glorified as a survivor. Others, such as Fred R. Miller and Emanuel Berkenfeld appeared to attack the capitalist system. Miller's "The Go-Cart Race" demonstrated the pitiful attempt of an immigrant family trying to realize the American dream. Berkenfeld's "Liberty Take a Bow" demonstrated the suffering experienced by the poor when capitalism and patriotism hid the effects of poverty.[6]

Several stories offered critiques of the economic system, yet maintained a focus on the immediate lives of the victims. In "Sunday," Thomas Cummings used the drowsy, indifferent atmosphere of a Sunday afternoon to bring out the characters' attitudes toward their livelihood, and toward one another. The characters Cummings created were lost in the shuffle of an economic nightmare, yet were so immersed in the horror of their positions, that they were unable to attack the system that produced the horror.[7]

Because survival consumed the lives of the characters, there seemed little sense of the future in most of *The Dubuque Dial's* stories. The two boys' conversation with the used car salesman in "Sunday," for example, illustrated a numbed response to the future. Similarly, in "Cistern," a woman instinctively jumped into a cistern to save the life of a child who symbolized her unhappy marriage. The woman's economic position forced her to marry, for survival, a man she did not love. Yet, she unhesitatingly sacrificed her own life to save her husband's child.[8]

The writers' choice to convey characters without panic in the face of inevitable devastation gave *The Dubuque Dial* a dark tone. The characters in the magazine seemed beyond the stage of a human response to calamity. They are reduced to actors rather than elevated to humans through their struggles to overcome the Depression and the economic system in which they existed. For example, in many stories the characters never expressed a sense of the future because actions were repetitive and cyclical.

This sense of being trapped in the present, in a pattern of living only for survival, however, was not unchallenged in the magazine. Proletarian themes again surfaced as class conflict was a very popular theme in many of the short stories. Although most stories dealt with the world of working class people, many stories contained vivid attacks on both the upper class and the upward mobility aspirations among all classes. In Karlton Kelm's "Hat Story," the superior attitude of a young lady eventually caused her downfall. Kelm continued his criticism of the destructive power of popularity and upper class aspirations in the second issue of *The Dubuque Dial* in his story "Greetings." Instead of one person being destroyed, an entire family was destroyed by their persistent competition for popularity among the town's wealthy citizens.[9]

Other writers, such as Robert O'Erisman, concentrated on positive ways to deal with class conflict. In his story "Chart of a New Friendship," a young man's experience with the superficiality of his wealthy girlfriend's family caused him to develop pride outside of social status. Stories like O'Erisman's showed the connection *The Dubuque Dial* appeared to have with proletarian issues. Often, the working class characters triumphed in the end. Moreover, the transformation of the main character from intimidation to confidence also appeared related to proletarian issues. As the Depression worsened, this sense of pride or triumph probably developed increasing importance as more and more people succumbed to poverty and the toppling class structure. Josephine W. Johnson's story took the concept of pride one step

BEST COPY AVAILABLE

further Johnson's story seemed to say that true knowledge of suffering and misery is better than a life of ignorance and protection In the proletarian atmosphere of *The Dubuque Dial*, higher status was awarded to those closest to the brute realities of life [10]

Although only 12 of the 42 stories in *The Dubuque Dial* were written by women, a large portion of the magazine's stories dealt with the plight of women Some of these stories remained centered on proletarian sentiment, while others seemed absent of such themes Dora Klar's "Three Days at the Zoo," for example, reflected proletarian themes As the woman in the story climbed the ladder of success, she became increasingly superficial and complacent Other stories seemed more concerned with social issues than political issues In David Cornel De Jong's "Autumn is Beautiful" the main character, a woman, is conveyed as strong, capable of overcoming poverty and moral decay in an effort to salvage the family [11]

Perhaps *The Dubuque Dial's* most powerful characteristic, however, rested in its diverse representations of the Depression itself Some writers depicted the strength of the sufferers, while others chose to tell the story of the Depression's demons Some writers saw hope, while others saw despair In the end, *The Dubuque Dial's* short stories revealed much about the various effects a world of mass poverty had on its victims Whether related to proletarian themes, or completely empty of them, *The Dubuque Dial* offered a vivid picture of the Depression's ramifications on humanity

Bruce Minton's "A Farmer Never Learns," depicted the despair of the Depression For the characters in Minton's story, the source of their suffering was not an act of nature, visible and horrific, but a man-made disaster, invisible and insidious In Minton's story, a tomato buyer swindled the poorest, most desperate farmers out of a higher price for their tomatoes The farmers, who toiled all year to keep their land, sold to a market they did not understand before their crops were even planted Minton described the cycle through one farmer's words, "And the farmer believes all your talk about markets and money being tight, and sells his stuff at a loss its stealing bread out of a fellows mouth The harder we work, the harder we get hit"[12]

Alice Sanner's "Spring On an Iowa Hill," however, was clearly rooted in hope. Unrelated to proletarian themes, Sanner's story placed the cause of the Depression in nature, rather than a political system After a farm family watched its economic survival eradicated in a dust storm, the mother placed hope in her unborn child Even though the woman's family believed it was the end of the world, the mother continued to place hope in the future For Alice Sanner, this presence of the unrealized future defied the idea that the Depression signified an end [13]

Unlike Sanner's central character, hope failed to save *The Dubuque Dial*. After the fourth issue circulated, the magazine abruptly ended -- a fifth issue never materialized The most obvious cause of the death of *The Dubuque Dial* could be attributed to the magazine's financial situation Although it did not pay contributors, the magazine's financial records showed that the first three issues of the magazine failed to make a profit The Federal Writers' Project also may have killed *The Dubuque Dial*. Although the project was not put together until the summer of 1935, well into the magazine's run, Iowa was one of the first states to utilize the project The Project lured at least two writers published in the magazine, Meridel Le Sueur and Raymond Kresensky, state director of the project in Iowa. The Writers' Project may have nourished Le Sueur and others, but it spelled trouble for the Kelms The Project probably would not have been willing to support a magazine affiliated with radical, proletarian literature [14]

Kelm's own literary ambitions also played a role in the demise of the magazine. For example, The Federal Writers' Project brought changes to the Kelms. At least one letter regarding a play the Kelms had written passed between the Kelms and Susan Glaspell, Director of the Midwest Play Bureau of the Works Progress Administration. It seems the project appealed to the Kelms--offering new opportunities at the expense of their initial experiment. Sensing a potential for success, the brothers left for New York in 1936, where they produced three plays that made it to the tryout stage in Broadway. Although the play based on Karlton Kelm's novel *Brother*, came extremely close to production, none of the plays ever materialized on Broadway. The Kelms left Dubuque and their magazine for New York, only to abandon writing after the failure of the plays.[15]

In the end, *The Dubuque Dial* proved a worthwhile experiment. It brought to life both the effects of the Depression on the region and the Depression's effects on the nation as a whole. Although Kelm never transformed the Midwest into a literary Mecca, he did awaken the minds of critics and call attention to the plight of the Midwest. Still, *The Dubuque Dial's* explosion into the world and abrupt disappearance resonated only briefly. One of the last comments on the magazine was written May 1, 1935, by Erling Larsen, "It is too bad so many little magazines don't live long, but then many of them don't deserve to. I hope the Dial does. I know it is deserving of life, long life. I am anxious to see the new issue"[16]

The Stonor Letters and the Wars of the Roses: Violence and Politics in Fifteenth-Century England

Michelle Dowd

Department of History
University of Rochester
Rochester, NY 14627

Faculty Advisor:

Professor Richard Kaeuper

Historians have long been debating the social, economic, and political stability of the late Middle Ages. The Wars of the Roses have been a specific locus of this debate, and the historical representation of the Wars has changed with fluctuating historical attitudes. The paucity of viable sources makes the Medieval historian's task especially difficult, and this in part accounts for the disparity between various interpretations of the later Middle Ages. It is important to keep in mind several distinct questions that are relevant to my discussion. First, was the fifteenth century a violent time generally? Secondly, were the Wars of the Roses the cause or effect of any fifteenth-century violence? Lastly, to what extent were the gentry and members of lower ranks affected by the wars in terms of both politics and violence? These are major questions of debate for late-Medieval historians, and I will demonstrate the ways in which the Stonor letters can help us answer these questions.

A. J. Pollard and other historians have addressed the issue of late-Medieval source material and its affects on historical research. Pollard concludes his discussion of the matter by saying,

> Whatever individual researchers may unearth from record sources, it is likely that the Wars of the Roses will remain one of the more inadequately documented and controversial topics of English political history. (18)

The lack of adequate sources certainly complicates the process of historical recovery and intensifies the debate over the Wars of the Roses. The material that is available is often either unreliable or lacking in sufficient detail or depth. Perhaps the best sources of material available from the fifteenth century are collections of private family letters, such as the Paston, Stonor and Plumpton correspondences. While the Paston Letters have been examined in much detail by many historians, the Stonor letters have received a much less thorough treatment. Most historians use the Stonor Letters in passing to support larger conclusions about late-Medieval society or to date important historical events.

C.L. Kingsford, who also edited the only modern edition of the Stonor Letters, used the letters to argue in favor of a revisionist interpretation of the Wars of the Roses. He asserts that the Stonors led a quiet, country life, that the letters demonstrate "nothing more serious than one or two cases of distress," and that William Stonor experience no real troubles until he went to court (33-34,62-63). Kingsford's analysis of the Stonor Letters has gone virtually unanswered, and the Stonor Letters and Papers continue to be an underestimated source of historical information. I have conducted a close examination of the Stonor Letters and I wish to challenge Kingsford's analysis of the Stonor's experience of violence and participation in political affairs. I will first give an overview of the evidence in relation to the Stonor family's experience of violence, and I will show the ways in which the documents support larger claims about violence in the second half of the fifteenth century.

The correspondence of the Stonor family describes numerous occasions on which they were involved in violence. On several instances family members were directly implicated as either victims or propagators of violent deeds, but other times they were simply consulted or informed of such actions by friends or business associates. In either case, the Stonors were clearly surrounded by a continuing pattern of violence and unrest.

For example, it seems that a threat of disworship on account of the deeds of Stonor's servants led Stonor himself to take drastic action against Thomas Rokes and his wife Alice. On June 9, 1477, the documents record a "riot caused by William Stonor" and suggest only that the trouble was a result of the actions discussed in the previous letter (Stonor Letters, II, No. 182). The text of the juror's findings is in Latin, but it contains references to Williams "perturbations against the King's peace" his "leading of numerous ignoble people...with swords, bows and arrows...to the place of Thomas Rokes...at which place he smashed things to pieces and entered." It seems also that Stonor insulted, or threatened to assault Alice Rokes, so that "she was desperate of her life" (II, No. 182). The document ends by saying that Stonor did "grave damage" to the place of Thomas and Alice Rokes. This is a remarkable incident because it reveals the degree to which members of the gentry, such as Stonor, would be willing to take violence measures to ensure either their own reputation or claims to their land. Perhaps even more interesting is the degree to which William Stonor was personally involved in the violence, yet we do not hear of any serious repercussions levied against him.

Around the same time, William Stonor received a letter from Henry Makney urging him to aid him in his own legal battle. Makney writes, "Colyngerygge and y be at opyne warre: y purpose to entre in the Manere of Makney with Godes grace on Moneday or Wennyseday; and yf y have nede, y pray youe sende me a gode lade or ij that y be note bete owte ayene" (II, No. 190). Again we see two nobles involved in "opyne warre" over a land dispute, and allies, like Stonor, are being asked to provide additional support. This pattern occurs frequently enough in the letters to argue that it was a fairly common practice in fifteenth-century England.

These incidents taken together with numerous others in the letters suggest I think rather clearly a pattern of frequent violence directly connected to legal matters. This reinforces J.R. Lander's conclusion that "Readers of...the Stonor Papers...can hardly fail to notice that a large proportion of the violent incidents and the not infrequent riots which they describe flared up out of disputes over landed property or legal rights" (Conflict and Stability in Fifteenth-century England 170). On the basis of the letters, we can conclude that the Stonor family certainly did experience violence, often at an intense level amounting to "private war." Even the exceptionally vague letters or those in which the violence is only potential or unclear reflect an undercurrent of violence that was continually present in the lives of the fifteenth-century gentry.

However, it is necessary to ask the question, did the Stonors live in a chaotically violent world? Though violence was certainly a constant presence in the Stonors' lives, there is no evidence to support the debauched, chaotic world that the Tudor and Victorian historians endorsed. The letters contain many references to good tidings, peaceful times, and happiness (II, Nos. 176, 223, 252 (etc.), 293). Without assuming too rosy a picture, we can still reject the Tudor and Victorian concepts of the late Middle Ages as extreme and inaccurate.

It is also clear from the letters that the violence that the Stonors experienced did not spring from the Wars of the Roses *per se*; rather, the violence was linked to legal rights, as Lander has argued. Yet, it would be incorrect to say that the Stonors were not involved in political affairs or that the Wars of the Roses did not affect them in any way. I will now give a brief overview of my claim that the Stonor family, and especially William Stonor, was actively involved in politics, even though his involvement did not normally constitute armed engagement or open alliances. I will claim throughout this discussion of the Stonor's political affairs that political "involvement" should not be restricted in meaning to "military involvement." The Stonors demonstrate their concern and direct interplay with politics throughout the letters in many diverse ways.

The Stonors maintained a strong connection with the Neville family, one of the most important families in late fifteenth-century England. Also, the Stonors had connections and interacted with high-ranking nobles and even the king, though of course they did so on varying levels.

For example, on April 3, 1470, we find a letter of the privy seal from Edward IV to Thomas Stonor. Calling Stonor "trusty and welebeloved," the king informs him of Warwick and Clarence's flight into France. Other evidence, such as William Stonor's appointment as one of Edward's knights of the Chamber, suggests that the Stonors were relatively strong allies of Edward IV.

Several letters suggest that Elizabeth Stonor spent the end of 1476 in London (II. No. 168 and others). During the time she often wrote to her husband concerning political matters or court affairs. For example, on October 9, 1476, Elizabeth wrote that, "Syr, the Kyng hys come to Westemester, and I understonde there schalle be a great Counsell, whereffore I wot never" (II, No. 170). A few weeks later she commented in greater detail on her interactions with nobles at court. This particular letter indicates not only that Elizabeth had connections with high-ranking nobles and even the king's mother, but also that she was in a position to accomplish matters of business while away from her husband. She wielded enough individual authority to attempt to make an economic bargain with Elizabeth of York, and the rest of the letter suggests that she spoke with many of Williams' business partner about financial and legal matters. Certainly Elizabeth Stonor used her political connections to aid her husband's business dealing, a form of political involvement that many historians have overlooked or discounted.

William maintained his political connections throughout the next several years. Sometime between 1480 and 1482, he received a letter from Sir James Tyrell, the man who was later suspected as the murderer of the Princes in the Tower. The letter indicates that the two had been conversing and were on good terms. Around this same time we learn about William's connections with Thomas Grey, Marquis of Dorset and son of Elizabeth Woodville, Edward IV's queen.

The last several letters in the collection demonstrate most clearly William's vested interest in political affairs. At this time, William's political involvement was at its highest point. As the last letter in the collection indicates, William was soon to participate directly in Buckingham's rebellion against Richard III.

This final letter is addressed to Sir William Stonor from Francis, Viscount Lovell. It was written on October 11, 1483, the eve of Buckingham's rebellion. Lovell is requesting William to join Richard's army against the impending rebellion, and to bring Lovell's own men with him. Though the letters end here, Horrox and other historians have written conclusive statements about the rebellion. Horrox explains that even though Lovell requested William's aid for the king, "Stonor joined the rebels, and may even have taken Lovell's men with him" (161). William had evidently been doing a great deal of dissembling; Richard and Lovell obviously thought him to be loyal until the very beginning of the rebellion.

The motive behind William's decision to join the rebellion is not clear. Though we do not know William Stonor's feelings about the disappearance of the princes, we do know that he was a dedicated household servant of Edward's. This connection may well have led him into rebellion and eventually to join in the rebels' second effort: to put Henry Tudor on the throne (Ross 113, Gillingham 227). Indeed, several years later William did fight for Henry VII at the battle of Stoke on June 16, 1487 (Kingsford, Introduction, Stonor Letters and Papers, xxxv). Though the Stonor lands were attainted, they were later restored.

This conclusion to William Stonor's career logically follows his political involvement throughout his life. I disagree with Kingsford that the Stonors' political involvement is unimportant for the historian or that it was initiated simply when William "went to court" (Introduction, Stonor Letters and Papers, xxxix, Prejudice and Promise 63). William had political connections of varying degree throughout his life; indeed, he became acquainted with Dorset not at court, but at his own estate during the courtship of his third wife. Further, Kingsford's comment that William had "wit to keep clear of politics" seems both false and naive (Prejudice and Promise 63). The Stonor's political connections permeated much of their lives, as the letters indicate. William especially found it necessary to play along with the political game at various points in his career. I would argue that William had the wit to be involved in politics, at least to be involved as much as it suited his own needs. Clearly the political machinations that comprised the Wars of the Roses affected William Stonor and his family in very basic ways, and the turbulent conclusion to both the letters and to William's career demonstrate the political ramifications of the wars most clearly.

How then have the Stonor Letters answered the questions which I posed initially? First of all, my analysis of the letters in the context of fifteenth-century violence suggests a "compromise" position between the extremes of the Tudor and Victorian historians and advocates of fifteenth-century "peace" such as Gillingham and Kingsford. I demonstrated earlier the ways in which the Stonor Letters refute the Tudor/Victorian concept of a depraved and chaotically violent England in the fifteenth century. However, my reading of the letters does indicate that a great deal of violence permeated the Stonors' lives. This renders questionable such optimistic statements by Gillingham as "the fifteenth century...was a society organized for peace" or Kingsford's claim that people lived in "tolerable ease and prosperity" with little turbulence in their lives (Gillingham, The Wars of the Roses 11, Kingsford, Prejudice and Promise 64,73).

Furthermore, historians who argue for the low level of violence caused by the wars, give a false impression of the "benignity" of the period. The crucial question to be asked here is this: were the Wars of the Roses the cause or effect of fifteenth-century violence? Nearly all modern historians seem to agree that the Wars of the Roses were largely the result, not the cause, of local violence. As my analysis has suggested, and as J.R. Lander has concluded, fifteenth-century violence was due primarily to legal disputes, not to war. This, as we have seen, was particularly true of the Stonors. Carpenter's claim that the Stonor's geographical region was "not a particularly litigious or violent part of England" seems suspect at best (Carpenter 177). Likewise, by claiming that the Wars of the Roses had few or no violent repercussions on people like the Stonors, historians often suggest that there were therefore no violence repercussions at all. They fail to take into account the fact that the very real violence that the Stonors and other families experienced may have resulted from something other than the wars themselves. By ignoring the legal side of the equation, they give a falsely benign image of the age.

It is also important to keep in mind Lander's assertion that "Turbulent, violent, and corrupt the age certainly was, though probably not more so than earlier times" (Conflict and Stability 190). Historians who accept the Tudor or Victorian depiction of the fifteenth century as excessively violent often do not consider fifteenth-century violence in the context of previous centuries. Certainly in the fourteenth century, protest literature and documents in the public record office attest to a great deal of violence, again often resulting from legal disputes or corruption. With this consideration, we can view the fifteenth century as neither much more nor much less violence than the rest of the Middle Ages.

Finally, we must ask about the extent of gentry involvement in the politics of the wars. I believe that the dismissal of the Stonor Letters as lacking in political importance by many historians, including Kingsford and Ross, is both unfortunate and unfounded. Certainly if we define historical importance in terms of textbook dates and major battles, the Stonor Letters may be found lacking. But the Stonors, William especially, were politically involved throughout their lives, both locally and in London. The letters inform us a great deal about the way in which political "news" was conveyed, the way in which women such as Elizabeth Stonor could act as go-between in political and business matters, and the way in which men like William Stonor could manipulate the loyalties of the king's trusted followers to suit his own ends. Though it is dangerous to generalize too broadly about the normalcy of the Stonors' situation, I think we can at least acknowledge that the example of the Stonor Letters should be cause for more detailed analysis of the position of the gentry in the fifteenth century in terms of violence and political involvement. This may very well involve a reexamination of what "counts" as political or violent, a reexamination that will be necessary if we wish to explore these aspects of the fifteenth-century in a thorough and accurate manner. Due to the scarcity of viable documentation from this era, historians will undoubtedly continue this well-established historical debate, and it may be that the Stonor Letters will play a larger part in it than they have thus far.

Thomas Becket and King Henry II
A medieval drama with a contemporary application

Thomas Becket's struggle regarding obedience to the king's authority is a classical example of church-state conflict during the Middle Ages. From Becket's perspective this institutional conflict represented the personal dilemma of how a man can obey both the state and his own conscience as infused by God. This famous medieval episode is not just a story of the distant past, but is part of a turbulent and heroic theme within the western heritage. The triumphant careers of Sir Thomas More and Dr. Martin Luther King brilliantly depict the individual conscience wrestling with state policies. Today in the United States military chaplains confronting the state's position on abortion face Becket's dilemma of reconciling obedience to the government and to the dictates of one's conscience. In my paper I will review the clash between Thomas Becket and Henry II. While their battle over judicial jurisdiction is now anachronistic, what is still relevant to contemporary issues are the ideals that were espoused. As I examine the church-state struggle over the courts, I intend to show how certain principles are still pertinent to the human dilemma of what authority to obey.

Throughout history men and women, in deference to the dictates of their consciences, have stood against the power of the state. Those who would rather give up their lives than compromise their beliefs and principles include Martin Luther, who denied papal supremacy before the German emperor; Thomas More, who accepted execution rather than swear an oath that declared the king of England the head of the church; Mahatma Gandhi, who upheld the rights of Indians in the British Empire with nonviolence; Dietrich Bonhoeffer, who refused to preach Nazi ideology from the pulpit and died in a concentration camp; and the Reverend Martin Luther King Jr., who led the civil rights movement in the United States against state sheriffs and snarling German shepherds. One of the most captivating statements concerning higher law is found in Reverend Martin Luther King's *Letter from a Birmingham Jail* that says "an individual who breaks a law that his conscience tells him is unjust, and who willingly accepts the penalty of imprisonment in order to arouse the conscience of the community over its injustice, is in reality expressing the highest respect for the law" (Andrews, 128). A recent exhibition of those who seek to abide by moral laws of conscience is, in fact, currently occupying news headlines today. The Pentagon has attempted to silence its own chaplains regarding the issue of partial birth abortion. In support of these military chaplains, Kevin Hasson, founder of the Becket Fund for Religious Liberty, views such government actions as "gagging preachers in their own pulpits." One of the plaintiffs, Father Vincent Rigdon, believes he is being prevented from doing his spiritual duties of counseling how his parishioners should practice their faith in everyday living (Christianity Today, 1996). The Becket Fund, founded ten years ago, specializes in cases of religious freedom, and is named in honor of Archbishop Thomas Becket who was martyred by the king's knights for defending the principle of religious liberty. Although Thomas Becket's story comes from the middles ages, its message of the sacredness of the individual conscience over and above the power of the state has contemporary application.

Medieval society rested upon two institutions—the state that provided people temporal security through the power of law and armor, and the church which provided the people eternal security through its role as mediator of God's grace. The power of the church throughout the middle ages was a source of authority to contend with by all. William the Conqueror benefited from the universal power of the church. In 1066 Pope Alexander II gave approval to William the Conqueror's conquest of England and he appointed Norman bishops in English Sees (Latourette, 462). The cost of those papal arrangements made in England was England's recognized constitutional tie to the universal church. William the Conqueror allowed England's spiritual tie to the papacy; however, he strictly reserved all matters of law for royal authority. William cleverly refused to swear an oath of fealty to the papacy by resting on ancient royal custom. Pope Gregory VII demanded King William's vassalage, but the king only agreed to send tithes to Rome. These measures taken by William sought to prevent the invasion of papal authority. However, his endeavor was not completely successful because of the ecclesiastical power within England. Papal authority in England was the avenue by which the pope in Rome could reach directly into England and its spiritual matters.

BEST COPY AVAILABLE

The pope commanded spiritual matters across Europe. The church implemented policies that regulated wars. Church laws based on spiritual ideals governed the conduct of war to eliminate brutality on designated sacred days. In 1139, the Second Lateran Council forbade jousts and tournaments, since these encouraged feuds and bloodshed (475). It became evident that the rules made by the pope in Rome had the potential to interfere with matters of state. The pope upheld Christian principles that further differentiated God's laws and "Caesar's" laws. During wartime, the Truce of God forbade fighting from Saturday to Monday morning (473). Such spiritual laws carried the weight of papal authority and were upheld by clergy across Europe. Papal authority was the voice of God on earth. As we shall see, it was God's voice, which Becket sought to defend as archbishop of Canterbury.

King Henry II was a strong feudal king who concerned himself with the enforcement of laws and justice. As king of England, Henry II was the supervisor of the political structure that provided the necessary components of stability and safety for England's developing medieval society. That political structure depended on the personal pledges between nobles that equipped England with a strong military force. The protection and order enjoyed by the nobles was under direct supervision of the king. It was the responsibility of the king to enforce such feudal laws. Therefore, Henry not only assumed command of England through his Plantagenet ancestral claims, he also happened to take his responsibility of law and order very seriously. The success of a strong political institution depended on oaths of personal loyalty by every subject, including the clergy.

The quintessential struggle between this English king and Archbishop Becket was lay investiture. The tool Henry used to undermine church authority was lay investiture. The investiture controversy is the term and issue that is often applied to the dispute that occurred between Pope Gregory VII and the Holy Roman Emperor, Henry IV. This controversy occurred one hundred years earlier than Becket's struggle against King Henry II of England. The central issue for Pope Gregory was the independence of the clergy from control of politically motivated nobles. In Germany, the bishops and archbishops had become great territorial rulers. To control them, Henry IV insisted on appointing the bishops and demanded that they swear allegiance to him. Gregory would not tolerate lay investiture because divided loyalties diverted the bishops from their proper functions. According to Kenneth Scott Latourette, lay invested bishops acted both in "the spiritual oversight of their flocks, and like secular princes with secular interests" (473). The removal of lay investiture strengthened papal authority by upholding the church's role in matter of leadership. According to the Concordat of Worms, which was an arrangement reached between the church and the German Empire, bishops were to be autonomous because the clergy's spiritual power has "been divinely given to them by the grace of the Holy Spirit" (Bettenson, 102). The pope hoped, then, that the Concordat of Worms would enable the bishops to fulfill church priorities based on spiritual ideals.

Church doctrine asserted that papal authority was passed down from St. Peter to each consecutive pope and extended throughout Europe by archbishops, such as Thomas Becket in Canterbury. The pope alone, by means of his identification with Peter, "would always be a true Christian," and thus able to recognize who was of God and who was of the devil (Blumenthal, 118). According to Uta-Renate Blumenthal, this perspective shows why Gregory, firmly convinced of his divine mission, claimed the right to depose not only bishops but also secular rulers. Gregory's action culminated in the excommunication of Henry IV who had defied papal authority. Medieval rulers did not take kindly to excommunication for fear it would lead to a revolt of their nobles against their authority. Such was the case for Henry IV whose royal authority was eroded because of the pope's excommunication that ignited a revolt by Henry's vassals against his imperial authority.

In summing up the investiture controversy, it can be seen that Gregory acted on the fundamental principles of Christianity written by St. Paul. Paul gave direction for temporal behavior in letters to the Romans. Paul said that states should be governed by belief in the omnipotence of God and by the conviction that state and society should serve some divine purpose (Tellenbach, 26). During the middle ages clergymen, like Thomas Becket, presumed to decipher that purpose. Gregory's actions to end lay investiture determined the relationship between royal and priestly authority by implementing canonical principles that regulated ecclesiastical elections. These regulations were devised to prevent the state from trespassing into church affairs. However, one hundred years later, King Henry II of England disregarded these rules and manipulated Becket's elections as archbishop. In doing so, he installed his friend to the post of archbishop to be his tool to dominate the church.

King Henry II's great ability as a ruler was most clearly demonstrated by his endeavors in the English judicial system and the English common law. It was as a result of state judicial expansion that he restored order to England from the period of anarchy tolerated by his predecessor King Stephen. The church courts fell under Henry's sweeping scrutiny as he attacked the benefit of clergy, which was a privilege that allowed them their system of courts. It was this issue that initiated the clash between Henry and Becket. Henry spent the first years of his reign in restoring order in England and destroying the unauthorized castles of anarchic nobles. As chancellor, Becket had worked with Henry to extend royal authority. However, once he became archbishop, Becket did not tolerate the royal infringement on church authority.

Although the bishops of England elected Thomas Becket canonically, King Henry II had arranged and influenced the outcome of that election. Henry's attempt to curb church power failed because of Becket's obedience to canon law. Furthermore, Becket did not cooperate in Henry's endeavor to uproot the authority of the church. Without compromises from the church, Henry's alternative was to restrict ecclesiastical independence. The regulation of church courts was Henry's next step in limiting church power. Henry was determined to place all in England under his law. Without Becket's subservient loyalty, the king was compelled to rise against Becket and the clergy in order to subordinate the church to his will. It can be seen that lay investiture was not successful because Becket acknowledged God's law above royal laws. Becket strongly advised Henry to remember the "paramount jurisdiction of the spiritual power" (Knowles, 111). It is now necessary to consider King Henry's perspective in the development of his vigorous policies. The king's means to control the church courts were based on English custom and feudal obligations.

Since the reign of William the Conqueror church courts had claimed exclusive jurisdiction in all matters concerning ecclesiastical issues. Numerous crimes, such as murder, were committed by clergymen during Henry's reign, but these privileged persons were tried in church courts, where the punishments were mild, rather than royal courts, where the punishments were severe. Once convicted of crimes by the ecclesiastical courts, those clergymen were simply defrocked and released. "Henry complained that such offenders often received absurdly light sentences" (Hollister, 53). To the king the benefit of clergy represented church sovereignty within his own kingdom. According to W. R. Warren, Henry pursued the restoration of a royal authority above all others, including the clergy, just as vigorously as he sought to ensure to every man peaceful enjoyment of property and his protection from crimes (Warren, 448). From Henry's perspective, his attack on church courts was in fulfillment of feudal customs, which assigned earthly lordship to the king.

The enforcement of feudal customs was the premise for the document, the Constitutions of Clarendon. It was written by Henry and ignored by Becket. The clauses that disturbed Becket the most concerned the limitations placed on excommunication, restrictions on appeals to Rome, and the treatment of corrupt priests (Pain, 101). Among the egregious clauses that particularly offended Becket, one stated that the trial of any accused churchman was to be supervised by the king's officer (Bettenson, 160). This clause was an infringement of the bishops' authority, and it would open the door to civil censorship within the church. But the clause that generated the clergy's overwhelming opposition to the Constitutions demanded the sworn allegiance of newly elected bishops. "The person elected shall do homage and fealty to the lord the king for his life and limbs and honor before he can be consecrated" (160). Becket understood this claim to conflict with the bishop's allegiance to a higher spiritual authority. In two ceremonial audiences before Henry, Becket only swore conditional obedience to the king. These conditions upheld God's honor before all and church liberty from the overweening power of the state (Knowles, 120&125). Becket's conscientious conviction to the principle of church independence and his persistence in defying the royal will resulted in his murder.

Devoted members of the king's nobility murdered Becket. Graphically described by J. R. Green, the murder was carried out by nobles who viewed Becket as a traitor to the crown. These nobles were upholding a strict feudal political structure that was to be presided over by the king. Becket died upholding the spiritual authority of the church. As the sword blows slashed through his body in the cathedral on Christmas day, the fallen archbishop was heard to murmur, "I accept death for the name of Jesus Christ and his church" (148).

Conscientious persons opposed to the state are sometimes killed, a few are remembered as heroic martyrs. Thomas Becket is one of those. Becket's defense of God's honor and the church's freedom resulted in Henry II performing public penance, the king abandoning his attempt to control the church courts, the pope proclaiming Becket a saint, and many people traveling to Canterbury Cathedral to Becket's shrine. Sometimes, when ordinary persons take a strong conscientious stand for justice, history's judgment is to remember them for their extraordinary behavior. Today Father Vincent Rigdon is a relatively unknown, ordinary man who has taken a stand against "the threat of criminal prosecution" in obedience to his bishop's directive to speak out on abortion. At this date the historical judgment on conscientious opposition to abortion has yet to be made.

Professor Larry Lipin, Ph.D.

After WWII Americans expressed contradictory emotions of excitement and dread: excitement for the end of the war, and dread for having had to open up the nuclear age to achieve it. Recent scholarship also shows this mix of emotion in the scientists and politicians who made the decision. My research in the popular press of *Time* and *Newsweek* brings to light the fact that these same feelings appeared in the American public. A close examination of the popular press of the time reveals that authors, often in the same articles, expressed impending anxiety and fear. Joy and fear coexisted. A one-sided interpretation and understanding of the American response to the dropping of the atomic bomb is therefore both inaccurate and unfounded. The same action that granted Americans the peace they coveted most also created a paradoxical world where peace and potential annihilation tenuously existed hand in hand. The very basis for the American national sense of victory and excitement gave birth to the fear that next time they would mourn devastated cities left reeling from the very nuclear power Americans themselves created.

Though Franklin Delano Roosevelt termed it "a mighty endeavor, a struggle to preserve . . . our civilization and to set free a suffering humanity," WWII changed the way the world viewed war--especially with regard to noncombatants.[1] Historian Barton J. Bernstein portrays an emerging internal struggle among the White House military advisors and cabinet members, pitting an old dying ethic of warfare which targeted only the soldiers against a new ethic where race, nationality, and treaty preference made people uniformed or not the enemy.[2] Gone were Napoleonic chess matches where strategy and movement of troops won. Instead it proved a Darwinian battle of technological evolution. The moral implications of such a paradigmatic shift troubled American political and military decision makers. They struggled.

From the outset, the ethics and morals of using the atomic bomb were controversial. Proposals for a display of power for a Japanese audience and/or limited tactical/military use remained the two most viable options next to dropping it on a populated city. The scientists in the research group initially pushed for a technical display of power to play on Japanese fear until Oppenheimer and others informed higher-ups that a technical demonstration alone would not necessarily suffice in bringing an end to the war.[3] Using the weapons in the scheduled 1 November 1945 invasion of mainland Japan became the new push. Admiral Richard Connoly, who was to provide naval support for this operation, "wanted to put one [atomic bomb] on either side of each landing, [there were three scheduled] before, the troops landed.". The researchers assumed the target to be purely tactical: military sites, industrial areas, troop placements--not cities.[4]

Army Chief of Staff George C. Marshall and Secretary of War Henry L. Stimson likewise pushed for a use limited to military "objectives such as a large naval installation." The thought of using such a weapon on civilian areas was contrary to the long established war ethic founded in "Christian doctrine and in international law." It made them uncomfortable. Stimson, in a conversation with Truman in late May of 1945, assured the President that the weapons would be used so as to spare civilian lives in the name of "fair play and humanitarianism." This sentiment was not deeply held. Voiced concerns that the daily fire bombing of Japanese cities would deprive the new weapon of "a fair background to show its strength" testifies to this. What is more, two days after their discussion Stimson "stipulated that noncombatants would be acceptable targets." Aiming at a "vital war plant closely surrounded by workers' houses" was not merely justifiable but desirable. This idea would proceed unchallenged.[5]

This did not make the decision easy. The moral ambivalence which marked the transition from an old war ethic to total war trapped everyone from researcher to president. On 25 July 1945, however, the moral debate ended when Truman ordered the dropping of the first atomic weapon "as soon as weather will permit visual bombing after about 3 August 1945."[6] The decision was finalized eleven days later when the *Enola Gay* dropped the first "fat boy" on Hiroshima, and nuclear warfare began.[7] Three days later *Bock's Car*, another B-29, released one over Nagasaki. Both caused great destruction and tens of thousands of deaths, but in the American mind this was not emphasized. Peace was, Americans were looking for a release after four dark years of total war. The pages of magazines and newspapers of the era were filled with stories, memoirs, and descriptions of the battlefields. Pictures of the devastated cities of Japan and Germany were constant reminders to the people that there had been a war, and Americans had been killed. In the months following the dropping of the bombs countless stories of countless GI experiences revealed many of the war's cruelest realities. On 10 September 1945 *Newsweek* described liberated U.S. prisoners of war as "frantic prisoners. . . [who]. . . danced stark naked on the shore as American rescue ships approached."[7] Camps where many had been brutally tortured, where many suffered beriberi and dysentery, where many had died, were described in great detail. Giovanni Lomanitz, who had studied under Oppenheimer before the war, expressed the sentiments of the nation when on August 7 he wrote: "You [Oppenheimer] may not know it but today you're about the best loved man in these parts [for, producing the bomb]. The guys. . . are overjoyed."[8] Upon the signing of the treaty, Truman is quoted: "From this day we move forward. . . . We move toward a better world of peace. . . . This is a victory over tyranny." Moments later came the word all Americans had been praying to hear: "I [Truman] report to you that your sons and daughters have served you well. . . . They are homeward bound."[9] The ancient historian Herodotus once said, "in peace sons bury fathers, but in war fathers bury sons."[10] To limit these occurrences as much as possible, Truman brought the "sons" home.

A picture of rubble resting silently at the foot of a dead tree is placed ominously in the 31 December 1945 issue of *Time*. Its caption reads: "For a nation that wanted to use it [the A-bomb], it was a cheap way to wage war."[11] But more importantly it was safe. There is little remorse in the language of the major publications of *Time* and *Newsweek* and even less in the actions of the American people in the three or four months directly following the atomic bombings, because the war was over. The soldiers came home. And the American public rightly celebrated the return of the mighty fleet; they genuinely expressed a relative disinterest in the ethical question concerning the atomic bomb and its use. The major interest was placed in celebrating the end of the war. After Nagasaki, Truman still "[rode] a wave of unprecedented popularity."[12] Two months later a parade "up Fifth Avenue past the flags and the glittering shop windows" celebrated "the greatest Navy in the world in the greatest city in the world."[13] The air reverberated with the echo of one twenty-one gun salute after another, as forty-seven ships in all paid tribute to Harry Truman, "a very plain man indeed, who had never planned on being Man of the Atomic Year."[14] Thundering overhead 1,200 Navy planes displayed aerial power so awesome all present basked in the renewal of peace–and in America's ability to keep it.

The war was over, the men were home. Now it was time to celebrate. *Time* described "the biggest, noisiest, New Year's Eve party in a long, long time," where "bars would be open until dawn, U.S. roadhouses would be neon-lighted after dark, . . . [and]. . . females would have the urge to write with lipstick," and with the "first tock of 1946 . . . U.S. citizens would consume enough alcohol to float a rinkful of ice." This was a time to forget about the war years of stodgy rationing and simple living. The time for social penance and puritanical sacrificing of time, money, and family gave way to a "Democratic Society [in which] there is great room for experiment. . . [and]. . . the free play of economic and social innovation."[15] All eyes were to the future which offered more than reports of death camps and pictures of mushroom clouds. Americans were willing to "guess that the future would be vast and exciting," and merely four months after the end of WWII the populace seemed willing to drown the past in a new year's shot of bourbon and start fresh.[16]

Regret for war-related actions is absent. According to Lifton and Mitchell, authors of *Hiroshima in American: Fifty Years of Denial*, the predominant myth of necessity justified the atomic bombings in the eyes of the American people.[17] There are deeper reasons, however. Many acts of war defy any other explanation than simply "war is war"; we believe our actions are just and moral while those of our enemies are unjust and immoral. Social psychologists termed this reciprocal concept mirror-image perceptions. While applied to all nations in all cases, these "perceptions" see no race. The Allies viewed the Germans and Hitler as evil incarnate. They viewed the Italians with Mussolini the same way, and during the Cold War era Americans held Russia and her Stalin with the same disdain and condemnation. This psychological ability allows a belligerent nation's racially "warped and slanted" views of a co-belligerent's government and leaders to progress to where "perceptions . . . may become so skewed that they entirely misrepresent reality."[18] We are good; the Japanese are "yellow subhumans."[19] Truman, the generals, the soldiers, and many Americans in general believed the Japanese to be ruthless savages, merciless fanatics. Race was an important aspect of the Pacific Theater.[20]

The racist stereotyping of the "Japs" stated most eloquently by Idaho's Governor when he offered that "a good solution to the Jap problem would be to send them all back to Japan, then sink the island" while speaking of Japanese in America no doubt illustrates the anti-Asian animosity so prevalent throughout the 1940's. This was of course applied automatically--without a doubt more forcefully--to Japanese nationals who killed American soldiers.[21] Kamikaze fighter pilots suicidally attacked ships, prison camp horror stories of brutality, the ancient Japanese military code of *bushido* (or way of the warrior) sarcastically presented, and pictures of mystic charms drawn defensively in the sand proved in 1945 that the Americans' stereotypical Japanese was real. All helped create the atmosphere of mocking enmity necessary for *Time* to heroically dub the dropping of the atomic bombs "the greatest of all 1945's greatest events." For the masses of 1945 this was the pseudo-justification: the all-encompassing, nothing-damning psychological distancing from the action which ended the war. This same action, however, produced a deep fear.

The bomb brought more than merely peace to the homeland. The dawn of the atomic age, wrote one author of a *Time* article, "represented a brutal challenge to the world to keep the peace."[22] With the power of the atom unleashed, the world faced the new threat that an aggressor nation could annihilate with relative ease any nation's power to resist with relative ease. The researchers had come up with the scientific discovery of their generation. However, the problem facing the world was how to restrict its application. Clement R. Attlee, British Prime Minister, refuted the thought that the world could share "scientific knowledge on atomic energy while its applications to weapons are kept secret." Implied was the threat of world domination by those who held the secrets of the technology. The Big Three must "share all atomic secrets . . . [and] . . . appoint a body to study means of control and supervision of atomic developments," Attlee believed; and he believed it so strongly that he would discuss nothing else during "an atomic showdown" early in November.[23] Seeing the U.S.'s monopoly of power, other nations began to be leery. Around the globe nations pushed for equality of knowledge, but Truman and the U.S. government refused until all "possible methods of protecting us and the rest of the world from the danger of sudden destruction"[24] had been thoroughly explored.

One such solution, put forth by Albert Einstein, was to give up secrecy; he suggested "[t]he secret of the bomb . . . be committed to a World Government," an idea previously alluded to by Attlee.[25] Truman did not entirely disagree. The "hope of civilization," Truman said, rested in the organizing of world arrangements "which would renounce the use of the atomic bomb but encourage cooperation on harnessing atomic energy for peaceful humanitarian goals." However, this was only because other countries "would in time catch up with our knowledge of atomic research." The secrets of the bomb would not be turned over to, in the words of House Judiciary Chairman Hatton Summers, a "disorganized and largely psychopathic world," yet proposals for monitoring and controlling the development and expansion of national atomic development were understood. The government as a whole simply disapproved of "American disclosures concerning . . . our exclusive product."[26] And exclusive it was. At the end of the war we were the only nuclear-capable nation on earth. The failure to spread the knowledge could, therefore, be read as an attempt to maintain not just scientific, but also military supremacy. This would place us 180 degrees from the direction we faced at the beginning of the war. We had turned from a strictly isolationist posture to one as world dictator of global military supremacy. This plagued Einstein, causing him to question the justification for maintaining the secrecy of so horrific a power. To the rest of the world secrecy tacitly proved our desire to rule the world with veiled threats.

World sharing of information and retaliatory capability, while being the only cure to aggression and possibly the only solution to nuclear envy, ironically also offered Truman and others cause to fear the downfall and more-than- possible internal fracturing of the post-WWII United States. In a full page article in *Newsweek*, however, Ernest Lindley suggested politicians (like Truman) and scientists (like Einstein) alike were simply "groping" for answers. "Most officials, like most civilians, are feeling their way. Very few are sure enough of themselves to speak dogmatically," he states. Factors of time, maintaining a head start on other nations, outlawing atomic weaponry, and international supervision were simply "trends of thought, and . . . tentative conclusions" for providing at best an unstable and apprehensive international peace.[27] Threats of retaliation, ineffective controls fueling armaments races, and disallowing the world body to inspect nuclear production facilities stood as incentives to maintain secrecy. It was now a question of world peace. The desire was to avoid war on American soil. In other issues of *Newsweek*, proposals to Congress and conferences with Soviet and British leaders all appear under headlines with this explicit concern: "Behind Anglo-U.S. Peace Line-up Lies Horror of Atomic Bomb War," and "With Fingers Crossed" are but two examples.[28]

The problem was obvious and recognizable: "The world had finally found the formula for complete destruction." This statement is ironically found in the last paragraph of the story which ran directly preceding the account of the wild New Year's Eve party. Within the very act which brought peace lay the fetal beginnings of far greater destruction, and in this case we likewise were in danger of witnessing firsthand the devastation of nuclear war. The moral ambiguity of 1945 expressed in the choice between sparing Japanese citizens or using atomic weaponry dissipated with the fire and brimstone of the remaining rubble left behind a powerful sense of relief—and an equally unstable, fearful sense of insecurity. In a comically sarcastic look at the mandatory military changes wrought by the emergence of atomic weaponry, Sgt. Ray Duncan described the training in the Anti-Atomic Corps. The hope for atomic peace, he wrote, now lay in the hands of these men of Second Platoon employed "to neutralize and destroy the enemy's atomic weapons."[29] "[Y]ou're doing a *very* important job, men, keeping them [the enemy] from splitting our atoms," the first sergeant shouts. With the new weapons discussed and the revamped tactics presented, we come to a description of "a ruthless enemy who will stop at nothing, not even *poison gas*!" The feeling of vulnerability is tacitly implied. To end his story, the Sergeant, when discussing the unchanging nature of the Army, states: "There's only one way to escape the Army life, and that's to keep the world at peace."[30]

Einstein once said that "[a]s long as there are sovereign nations possessing great power, war is inevitable."[31] This fear plagued post-war America. While still in love with the tangible reality of peace found in the taverns and night spots on the eve of the dawning of the new year, people realized the precedent which their nation had set. Death count totals climbed, the pictures carried captions relating the destruction while showing the devastation, and the articles reported children burning to death and dying of radiation long after the A-bombs exploded. The dropping of the bomb symbolized a new era of warfare where technological advancement brought a victory in which no one was safe, and Americans mixed peace and happiness with anxiety and fear under the mushrooming expansion of global military power.

Henry Laurens:
The Making of a Revolutionary

James Hutchinson

Asheville, NC 28804-3299

Faculty Advisor:

Dr. Bruce Greenawalt

During the pivotal years prior to the American Revolution, Henry Laurens experienced several critical events which radicalized his views concerning American resistance to England. Paramount of these events were the questionable seizures of three of Laurens' commercial vessels by British customs officers in 1767 and 1768. These seizures and the subsequent court proceedings triggered a more extreme outlook in Laurens' view of American-British relations. Additionally, Laurens was influenced by several other important factors, such as his growing financial independence of England. These events in Laurens' life would eventually propel him to become a very significant figure in the American Revolution with profound consequences for the future United States.

Despite being one of our country's most outstanding leaders during the American Revolution, the name of Henry Laurens is not well-known.[1] A colonel in the South Carolina militia, a distinguished member of that state's legislature, and a highly successful businessman, Laurens first achieved national prominence in 1777 as a South Carolina representative to the Continental Congress. It was at the Congress where his fellow delegates recognized Laurens' outstanding managerial and leadership abilities by electing him to serve as its President.

Although these were bleak years for our new nation, Laurens' tenure as President were marked with noteworthy accomplishments. Two especially merit comment: the signing of the French Alliance and Congress' approval of the Articles of Confederation, often considered the first constitution of the United States.

Equally important was the personal friendship that developed between Laurens and George Washington, the Commander of the Continental Army. It was their close working relationship which helped to establish the rapport between the Continental Congress and the Army which, in turn, was crucial to the successful military prosecution of the war.

Although Laurens eventually became one of our country's leading patriots, his early business experiences and public life in South Carolina gave no hint of any tendencies toward the separatist stance he would eventually adopt. Instead, he was initially a conservative in outlook.

As late as the 1765 Stamp Act Crisis, Laurens maintained his loyalty to Britain. Unlike more radical patriotic leaders, Laurens counselled against resisting the Stamp Act and other new taxes imposed on the colonies during this period. Though he particularly disapproved of the Stamp Act, he felt that resisting it would only make matters worse--particularly for merchants like himself.[2]

As a result, Laurens was accused of being a supporter of the Stamp Act by more radical colonialists, and an angry mob attacked his Charleston home in a manner similar to the attack on Governor Hutchinson's house in Massachusetts.[3]

His initial conservatism regarding British-American relations and his compromising approach toward new British taxes were shaped during the twenty-five years that preceded the American Revolution. During these years Laurens enjoyed ever increasing success and status--first as a prominent merchant and, later, as a successful planter. Moreover he was a highly respected member of the South Carolina legislature.

This begs the question: What were the events that caused Laurens to make the transition from a politically conservative British subject to an American patriot? This paper will address some events that forced this transition.

In 1744, Laurens' father sent him to London as a mercantile trade apprentice. Laurens clearly learned quickly and well because, upon his return to Charleston in 1749, he soon established himself as a major international trader and shipper. He imported rum and various kinds of foodstuffs from the West Indies, manufactured goods from Britain, and slaves from Africa. He exported such goods as rice, indigo, deerskins, and naval stores. Laurens' business operations depended heavily on British firms and ships. From a financial perspective, this state of affairs was so satisfying that one can easily assume that Laurens would have preferred for it to continue indefinitely. As a consequence, he might have remained loyal to Britain except for four factors which compelled him--perhaps reluctantly--into becoming an American patriot.

The major factor was the unjustified seizure of three of Laurens' ships in 1767 and 1768 by corrupt British customs officials on flimsy charges which should have been dismissed, but when these ship-seizure cases went to the Charleston Admiralty Court, the British judge was anything but impartial. The judge, Sir Egerton Leigh, ruled against Laurens because his judgeship--and his court fees--depended heavily on the support of the corrupt customs officials.[4] Clearly, the outcome of these ship-seizure cases greatly soured Laurens' respect for British justice, and he was transformed from a political conservative into the leading American patriot in South Carolina.[5]

Many historians believe that the ship-seizure cases alone are sufficient to explain Laurens' transition into an American patriot. However, there were three contributing factors which also influenced Laurens' transformation into a patriot. These contributing factors were more subtle, and all were based on Laurens' evolving economic independence from the British.

From his return to Charleston in 1749, Laurens had been a trader and shipper who was, initially, dependent on British business associates as well as British ships. But, by the conclusion of the French and Indian War in 1763, Laurens had begun to dramatically curtail his mercantile operations.[6]

In late eighteenth century South Carolina, it was the custom for prosperous businessmen to invest their surplus wealth in landed estates. When Laurens made this transition from mere merchant--albeit a wealthy merchant--to a planter, he became more economically self-sufficient and, most importantly, less dependent on British business associates and markets. Laurens was now in business for himself, shipping his own produce to various markets in vessels that he himself owned. Henceforth, he was largely master of his own economic destiny.

With the acquisition of former French and Spanish colonies-- especially East Florida-- as a result of the French and Indian War, Laurens quickly expanded his shipping markets to include these new lands.[7] Moreover, with the end of the war, the Georgia frontier had also been made much safer for new settlements--and still more markets. Laurens moved quickly and, by the end of 1764, was already exploiting these new intercolonial trade opportunities.

In fact, Laurens played a very significant role in the settlement of this new colony of East Florida. He was a very close friend of James Grant, the colonial governor, and acted as Grant's agent for shipments of foodstuffs, tools, slaves, and other items needed for the development of the new colony. His East Florida venture was so successful that, for the first time in his life, Laurens was presented with a lucrative alternative to trade with Britain or the West Indies. In one instance, Laurens sent Governor Grant a bill for 2,300 pounds--a very large sum in the 18th century.[8] A further illustration is provided by a quantitative comparison of two different periods of Laurens' business activities. From January 1, 1756 to April 1756, Laurens wrote 87 letters of business correspondence to mercantile firms in England and the West Indies, compared to only six with his fellow Americans concerning intercolonial trade.[9] However, this dramatically changed after Laurens began his involvement with the new settlements in Georgia and East Florida in 1764. From November 23, 1767 to February 16, 1768--one of Laurens' busiest mercantile periods with England after the French and Indian War--he wrote 28 business letters to Grant and his associates in East Florida, 17 to the new markets on the Georgia frontier, and only 49 to England and the West Indies.[10] In comparing these two periods, the percentage of Laurens' business correspondence with British firms dropped from 93.5 percent to 52 percent. While these numbers may fluctuate over different periods, it is clear that trade with England and the West Indies was not nearly as dominant over his business after 1764.

More importantly, Laurens' new intercolonial trade with the southern coast was almost entirely independent of British shipping. During this time period, Laurens only arranged for one shipment directly from Britain to East Florida.[11]

A third contributing factor which led to Laurens' transformation into an American patriot was also economic in nature. This was his decision to abandon his involvement in the African slave trade after 1763.

When he returned to Charleston from his London apprenticeship in 1749, Laurens had immediately become involved in the slave trade, which was a very lucrative business. Laurens became increasingly skilled in the importing and the selling of slaves. In time, he earned a reputation as an expert on identifying the proper types of African slaves--based on their origins along the African coast--for particular agricultural tasks. However, in 1763, Laurens revealed for the first time that he believed slavery to be morally wrong.[12] David Duncan Wallace, author of The Life of Henry Laurens, could find only one occasion after 1763 in which Laurens took part in the slave trade and only after strong pleas from a friend to serve as his agent.[13]

During his career as a merchant, Laurens made tremendous profits from the slave trade. Indeed, it is probable that most of Laurens' business earnings as a merchant came from the trade.[14] However, the slave trade was heavily dependent on British ships. It has been estimated that 90 percent of the slaves imported into Charleston came on British slave ships.[15] During this period, American slave ships were highly inadequate for carrying slaves from the African coast; there was very little headroom and the ships "were cheaply built and barely seaworthy".[16] Laurens was fully aware of the overwhelming percentage of British slave ships that entered Charleston harbor as opposed to American. He often wrote letters to the ship captains of the slave vessels and personally greeted many of the ships that pulled into harbor.[17] Thus, when Laurens gave up the slave trade, he knew he was giving up a great deal of his dependence on British shipping.

Although Laurens was the first prominent Southerner to denounce slavery, he never did it publicly. Later in life, in defending himself against attacks from other Southerners for giving up the slave trade, he indignantly declared that he had not given it up "out of the goodness of his heart,"[18] but that he was too preoccupied with the management of his plantations. This reveals that even a man of as strong a character as Laurens was susceptible to intense social pressures, and these same social pressures may partially explain why he eventually became a strong supporter of the Revolutionary cause.

A fourth significant factor in Laurens' transformation into a patriot was indirectly related to the ship-seizure incidents and his disputes with British customs officials and the Admiralty court. This fourth factor was his decreased dependence on the Royal Navy after the end of the French and Indian War.

During the war, French and Spanish privateers were a serious threat to both colonial and British shipping. As a consequence, colonial merchant ships often sailed in British convoys under the protection of the Royal Navy on trade routes to Europe and the West Indies.[19] This Royal Navy protection was very important to Laurens, and he often expressed concerns about privateer raids.[20] Early in the war, British and colonial trade had suffered greatly from privateers, but by the end of the war, the Royal Navy dominated the seas[21] and privateering along the colonial coast had been greatly reduced.

After 1763, Laurens never expressed any concerns about the need for Royal Navy protection of his shipping, and it is quite possible he now took the safety of the sealanes for granted. This situation may also have caused Laurens to question whether Royal Navy protection was really worth the irritations he faced with customs officials, Admiralty Courts, and the stricter navigation laws--including higher import duties--which the British had recently enacted. Thus, if Laurens felt the British were now going to be detrimental to his mercantile operations, this would be ample reason for him to favor a parting of ways.

These four factors combined to make Laurens the acknowledged leader of the patriot crusade in South Carolina after 1768. A man who was against a non-importation policy during the Stamp Act crisis now became and enthusiastic supporter of the plan in 1769.

As was mentioned earlier, Laurens remained hopeful that a peaceful compromise and reconciliation could be reached with Britain. He objected to thoughts of "separation and independence," as expressed in Thomas Paine's Common Sense.[22] This is the main reason he has always been considered a "conservative Revolutionary." A very practical man, he continued to disapprove of "zealots," believing that the extreme, war-like behavior they advocated would "have ruined Charleston."[23]

Despite these conservative tendencies, Laurens was without question one of the leading advocates of American rights after 1768. Thanks largely to Laurens' leadership, non-importation was as effective in Charleston as in the more radical coastal towns of the

North.[24] When war with England became imminent, Laurens was elected President of the First Provincial Congress of South Carolina in January 1776. He began his service as the Commander of the Council of Safety and, over the next twelve months, played a crucial role in planning for the fortification and defense of Charleston against a possible British attack.

In June of 1777, Laurens went to Philadelphia as a South Carolina representative to the Continental Congress, where he would play an even more prominent role on the national scene.

Although a man of great integrity, Laurens was susceptible to the same watershed experiences and periods of personal transition that could change the national loyalties of any man. While his anger over the seizure of his ships is, perhaps, the major reason for his conversion to the cause of the American Revolution, his diminished financial dependency on Britain as well as his loss of dependency on Royal Navy protection, were also contributing factors. All these ingredients would prove to be highly important for the future of the young United States, as Laurens would ultimately become one of her most valuable and outstanding leaders.

Beyond The Imperialist V Anti-Imperialist Dichotomy: American Intellectuals And Fin De Siecle Expansionism

INTRODUCTION

Most historians of fin de siecle American expansionism have divided intellectuals who addressed the matter into two distinct categories--imperialists and anti-imperialists. Although historians effectively support their arguments, documentation exists to contradict their dichotomous framework and convey ambivalence in the writings of American intellectuals.

The expansionists are represented by the two theoretical instruments of justification, Darwinism and Manifest Destiny. Darwin's theory of the survival of the fittest appeared to be the logical justification for the imperialist school of thought. Intellects including Josiah Strong, Frederick Jackson Turner, William Graham Sumner, Brooks Adams, and John W. Burgess, politicians including Albert J. Beveridge, Theodore Roosevelt, and Woodrow Wilson, and the back-seat Admiral, Alfred Thayer Mahan presumable provided the nucleus of late nineteenth century imperialist thought. The "community" of expansionist thinkers are portrayed as having "commonly shared ideas."[1] A commality exists amongst the historians interpreting late nineteenth century expansionist fervor. Each historian attempts to draw direct links between the above men to display conspicuous internationalist tendencies and to construct a definitive categorization.

Historians have conveniently categorized anti-imperialists as those individuals who "were gentlemen of the old school, representatives of a past era, [and to whom] imperialism did not appeal." Anti-imperialist intellectuals and politicians represented the minority position in the debate, which may account for the limited publication of late nineteenth century anti-imperialist thought. The anti-imperialist was not that dissimilar from the expansionist, in viewing the state of American "character" as pre-eminent. This minority group's refutation of the popular policy of expansionism was, historian Frederick Merk Notes, "strong enough to discourage" some imperialistic legislation. The forces guiding the various enclaves of the anti-imperialist movement were diverse, but two individuals are presented by historians as the most vocal opponents of the rising 1890's imperialist temperament--William James and Henry Adams.[2]

EVALUATING THE INTELLECTUALS

Analysis of the individual works of intellectuals helps to unravel the historiographic dichotomy to reveal the vagueness and ambivalence of most intellectuals on the topic of extra-continental expansion, and helps provide an alternate framework for categorization of the intellectuals. This more complex and non-dualistic model better illustrates the complex circumstances influencing the core of late nineteenth century intellectuals and the complex principles guiding a nation.[3]

Two distinctive intellectual groupings--ardent imperialists and ardent anti-imperialists--do appear to conform to the dichotomy. However, a third intellectual aggregation seems to prevail as the "mean" of intellectual thought during the imperialist 1890's. The remainder of this study is devoted to the presentation of a three layered framework for categorizing intellectuals. The three layers are: Those intellectuals who devoutly pursued imperialist ends; those concerned with the consequences of interventionist policy who expressed absolute anti-expansionist positions; and, thirdly, the larger aggregation of intellectuals who do not share a common position, but instead share a common ambivalence.

The imperialist interpreted the acquisition of non-contiguous territory as a necessity and a right. The individuals providing the justification for imperialist activity normally based such assertions on the absolute will of a pro-Anglo-Saxon Christian God. Josiah Strong's Our Country (1885) foresaw the "limited" unoccupied arable lands available due to the proliferation of "surplus populations" and urged God-fearing Anglo-Saxons to procure the available lands.[4]

As a reverend and missionary during the period of American westward expansion, Josiah Strong experienced the settling of a nation. His preachings resembled the Manifest Destiny that led Americans westward; yet, his ideas were further justified by Social Darwinism.[5] Strong viewed the "dispossess[ing of]...weaker races" and "assimilat[ion of] others" an inevitable consequence of an "Anglo-Saxonized manking."[6] Others, in accordance with Josiah Strong's philosophical leanings, would advocate imperialism, but due to extensive circulation of Our Country Strong remained one of the foremost pioneers of the position.[7]

Drawing on the "Heaven directed purpose" theory, established by Josiah Strong, Albert J. Beveridge wrote a speech entitled "The March of the Flag" for the 1898 Indiana Republican Congressional campaign. Beveridge's speech further emphasized Strong's notion of a preordained American future. The process of accumulating territory under the guidance of "God" was beginning to come to fruition in the year Beveridge wrote "The March of the Flag," for the Catholic "Spanish sloth" contributed to his brazen advocacy of American acquisition of previously Spanish territory. From this vehemently pro-Anglo rhetoric one may see a pattern of Old World continuity between Strong and Beveridge. Since the Anglo was presumably predestined by God to inherit the Earth, advocates of non-contiguous expansion were able to justify Old World imperialist ideologies through the word of the Lord.[8]

A deviation occurs, though, in the work of the standard evangelical expansionist--Theodore Roosevelt. Roosevelt's ideology represented a reduced dependence on religious imperial political thought. Anxiety over the closing frontier and over European imperialism influenced Roosevelt. He would find solace in the theories of Brooks Adams, Alfred Thayer Mahan and Frederick Jackson Turner. Roosevelt commented extensively on the works of Brooks Adams. He found Adams's The Law of Civilization and Decay "not merely interesting but solestirring."[9] Roosevelt also criticized what he believed were particular historical generalizations within Adams's text. Roosevelt was concerned with Adams's emphasis on the "fall of the soldier"--or the decreasing spirit of American virility. Roosevelt denied that this decline was imminent. "The life of action" remained in the spirit of Americans, Roosevelt exclaimed. The threat to the American spirit was only at "risk of wearing out" and far from a reality. According to Roosevelt, the proper course to avert this "rusting out" would be expansionism.[10]

Roosevelt seemed to view Adams's work as an ominous warning. Furthermore he interpreted Frederick Jackson Turner's writings as a justification for the commencement of non-contiguous expansion in the wake of the frontier's closing. Although a direct relationship between Roosevelt and Turner is difficult to establish, Roosevelt certainly heeded Turner's closing frontier thesis, and was concerned over the eventual "evil days" of stationary America.[11]

Perhaps a greater influence on Roosevelt was his correspondence with Alfred Thayer Mahan. The foreign and naval policy advocated by Mahan was viewed positively by Roosevelt, because it furnished the means through which America could expand. The theories of Adams and Turner may have affected Roosevelt's views on internal issues, but Mahan's ideology impressed on Roosevelt a sense of foreign urgency. Although Roosevelt was, from the outset an imperialist, his utilization of Adams's, Turner's, and Mahan's theories does not render those thinkers "imperialists by assocation." Roosevelt found the justification he needed in their works, but had to read them selectively to do so.

The anti-imperialists conception of overseas land acquisition agreed with the prevailing isolationist policy of the previous decades. The reason for refuting imperial initiatives was actually similar to the imperialist goal--to protect "our permanent ideals and character." William James along with the majority of prominent literary figures, and social activists, including Charles Francis Adams, E.L. Godkin, and Jane Addams sided with a domestically focused, anti-imperialist policy.

William James, as noted earlier, best embodied and expressed the movements's various positions. His vocal attacks on Theodore Roosevelt's famous "Strenuous Life" speech displayed an intolerance for the war hawk imperialists. James represented the antithesis of the often militant "competitive passion[s]" of the expansionists.[12] James's explanation for imperialist tendencies appears in an oration he delivered in 1897 entitled "Robert Gould Shaw." According to James, the imperialist symbolized one's "exaggerated" dependence upon the supposed virility of war, and the inability of "history...[to] breed the battle-instinct out of us."[13] James and the anti-

imperialist camp agreed that war and the acquisition of territory were archaic Old Word methods used to destroy the "moral fruits...of a pacific civilization."[14]

While there were clearly imperialists and anti-imperialists, many of the interpreters of domestic social and economic upheavals and/or external commerce concerns provided explanations mired in amvivalence. The dichotomy established by historians fails to exhibit the uncertainty of this third grouping. With the inclusion of this third element the complexity of the American intellectual and political framework during the 1890's is more accurately depicted.

Brooks Adams's, first work, The Law of Civilization and Decay (1885), describes the process of a state's decline. Adams's views on imperialism were distorted by various prominent American figures who were involved in crafting an expansionist policy. Although Adams's work may be a prediction of the future of American society, Adams himself noted that "American history is not brought into purview" in The Law of Civilization and Decay.[15] Even in his more focused work America's Economic Supremacy (1900), which appeared after the war with Spain, he remained ambiguous. According to Adams "the United States must provide sure and adequate outlets for her products, or be endanger of gluts."[16] Even though he referred to the war with Spain as an economic benefit, Adams continued to present the notion of imperialism as an option and not a necessity. He would note that "if expansion and concentration are necessary...then America must expand and concentrate until the limit of the possible is attained."[17] Adams seemed to be suggesting an increased governmental responsibility for the economy in order to foster international commercial "competition" by trade, not force. Adams's final option was to "fight our adversary" to obtain commercial pathways, and this was a last resort. Adams's expansionist outlook has been exaggerated and misinterpreted as advocacy of militant imperialism.

Brooks Adams' brother Henry Adams is also categorized as an imperialist by historians. Henry Adams's argument was complex. He questioned the position of the Western world's future, in part because of the influence of Brooks Adams's The Law of Civilization and Decay. Along with the acceptance of his brother's work came a distinctive ambivalence towards imperialist oriented causes. Henry Adams would "approve the war to free Cuba," while expressing disdain over the Philippine War. Even though he supported a war for a free Cuba he felt the conflict was the result of motives, certainly imperialist. Furthermore, his skepticism over the war in the Philippines was not the position of an imperialist.[18]

Alfred Thayer Mahan understood the potentially dangerous consequences of a small navy in a world where shifting dependence on larger naval systems was dominating. His article "A Twentieth Century Outlook" (1898) advocated American inclusion in the international arena. The type of inclusion, however, depended on who was interpreting his writing. Though Mahan believed "the Caribbean Sea, with its isthmus, is the nexus...[where] the United States has asserted a special interest," the type of action used to obtain access to these interests was only described as "an outward impulse," and nothing else.[19] Mahan may have used a militant tone in the article, but its actual emphasis is on the enhancement of commercial interests through naval superiority. The Influence of Sea Power Upon History, published in 1880 by Mahan, essentially examined the importance of naval forces in respect to previous European endeavors. Though he does allude to the circumstances of late nineteenth century commerce, the book offers no clear advocacy of extra-continental territorial expansion.[20]

In contrast to Mahan's empahsis on naval interventionism and overseas commerce, Frederick Jackson Turner's writings, particularly his most influential essay "The Significance of the Frontier in American History" (1893), emphasize domestic issues. Only one statement in Turner's 1893 essay suggests the author's support for future expansionist endeavors, and even that statement is an ambiguous one:

> American life has now entirely ceased. Movement has been its dominant fact, and, unless this training has no effect upon a people, the American intellect will continually demand a wider field for its exercise.[21]

This "wider field" mentioned by Turner may be interpreted as overseas expansion, or as countless other "field[s]" relating to domestic developments. it should be noted that the purpose of Turner's frontier thesis was to warn of the frontier's closing, not to remedy the consequences of that development.

William Graham Sumner is presented by some historians as the archetypical imperialist intellectual. William Appleman Williams, for example, viewed Sumner as a thorough-going imperialist. However, Robert Beisner emphasizes Sumner's association with the Mugwumps (a group with anti-imperialist leanings), and argues that he was an anti-imperialist. Both Williams and Beisner may actually have the right answer to Sumner's role in the 1890's imperialist debate. Sumner was a Social Darwinist who, according to his work Earth-Hunger and other Essays, justified imperialism when related to economics, but found imperialism for political reasons "a pursuit of great follies." It is complicated to distinguish between the two types of imperialism for the reason that "political earth-hunger" (as Sumner describes political imperialism) can be justified for economic reasons very easily. Earth-Hunger and Other Essays explicitly demonstrates Sumner's ambivalence concerning imperialism. Sumner, the harsh Social Darwinist, and, one would presume, the most likely intellectual advocate of American imperialism, is not so easily categorized.[22]

CONCLUSION

The imperialist versus anti-imperialist dichotomy presented by historians is only effective in categorizing some American intellectuals. Although extremists clearly voiced imperialist and anti-imperialist ideologies the actual mean in American intellectual writings was less radical and more engaged in questioning the consequences of both imperialist and anti-imperialist actions. Many of the questions confronting Americans remained unanswered even after the Spanish-American War. Even devout imperialists found non-contiguous territorial acquisition problematic following the war. Theodore Roosevelt explained in a letter to Frederic Coudert that the Philippines remained America's "achilles heel." The Platt Amendment is further testimony to the national skepticism concerning imperialism for the sake of national interest. The amendment suggested, or, at least, was intended to suggest, that American foreign policy was other-centered, not self-centered. The debate over non-contiguous expansion, though, had centered around whether imperialism would be beneficial or detrimental to the national character. The debate over America's fin de siecle expansionism is so complex because intellectuals were formulating their positions in response to the European powers' race for colonies. United States intent was not nearly so other-centered as the Platt Amendment implied but it was not as clear as critics of American expansion have argued, either. Indeed, American's fin de siecle expansionism was marked less by a great debate then by a great deal of ambiguity and uncertainty.

"BEING MADAME IS A MISERABLE JOB"
The Letters of Liselotte von der Pfalz, 1672-1722

Christie King
Department of History

Faculty Advisor: Caroline Castiglione

Elisabeth Charlotte, Duchess d'Orleans, came to Versailles in 1672 to marry the King's brother, Philippe d'Orleans. Almost immediately upon arriving, she began a correspondence in which she kept a running commentary on life at this celebrated court. Her descriptions merit examination because they provide insight into how frustrating life was for her at Versailles. In her letters she was highly critical of how women were treated at Louis XIV's court. Her opinions and attitude differed greatly from that of her contemporaries. Unsatisfied with the proscribed role for women, she related her attempts to redress the inequitable treatment accorded her gender. For a women of this time to openly criticize and challenge gender roles is rare and her letters merit close examination.

It was partly her background which lead Elisabeth Charlotte, or Liselotte as she refers to herself in her letters, to such unconventional attitudes. She was born in 1652 into a royal family at a small court in Heidelberg, Germany. There the attitude was much less pretentious.[1] The relaxed customs and habits of her home were in stark contrast to the pomp and ceremony that characterized Louis XIV's Versailles. Most importantly, though, the women in Liselotte's childhood enjoyed a great deal of freedom. Her aunts, in particular, were all intelligent, learned women who lead quite illustrious lives. One carried on a life-long intellectual correspondence with the eminent philosopher René Descartes. Another was a scandalous Carmelite nun who, according to Liselotte, "had so many bastards that she swore by 'this belly that has born fourteen children'."[2] Liselotte was closest to her Aunt Sophie, who instilled in Liselotte a love of learning and the habit of letter-writing. It was to Sophie that Liselotte directed the bulk of her correspondence, writing and receiving letters on a weekly basis for over forty-two years. Growing up with such active and independent-minded women as role models and in such a down-to-earth environment left a lasting impression on Liselotte. She was never able to reconcile the values of her childhood with what she termed the "debauchery," "restrictiveness," and "ridiculousness" of Versailles.

When she came to Versailles in 1672, she assumed the title of *Madame*. She made her feelings plain on how she felt about her role: "Being Madame," she wrote in a letter dated 21 September 1700, "is a miserable job." (123)[3] She suffered because she found that women at Versailles were expected to perform certain roles which conflicted greatly with what she had anticipated, given the independence enjoyed by her female relatives in Germany. She rebelled against these expectations by pursuing an extremely unconventional lifestyle. Eventually she completely dissociated herself, from court society, retreating into a self-imposed state of isolation, devoting most of her time to writing letters.

Her unusual position at court has caused her letters to be dismissed as novelties or anomalies as she was an outspoken critic.[4] In my analysis I explore how her letters reveal the thoughts and opinions of a woman who has often been overlooked in histories of Versailles. Liselotte's writing contributes much to our understanding of the role that seventeenth-century court society envisioned for women and how it compared to the role they envisioned for themselves. I begin by addressing the significance of letters to women in the seventeenth century. I then examine the content of Liselotte's letters, focusing on her critique of court life and the evidence she gave to demonstrate that women were subject to greater constraints than men. Her critique of the women around her indicates that she felt their behavior contributed to their inequitable treatment. Finally, I analyze the challenges she raised to this system of gender construction and show that through her writing she defied the conventional notions of womanhood.

As my sources, I examined a selection of letters edited and collected by Elborg Forster. Published in 1984, Forster provides the most recent and complete English translation. This compilation contains letters written upon Liselotte's arrival at court in 1672 through her death in 1722. Liselotte was, to say the least, a prolific letter writer. According to the writing schedule she gave in her letters, she devoted four days of every week entirely to writing. She wrote primarily in German, producing over 100,000 letters during her lifetime. As she admitted in 1719, after forty-eight years of letters, "writing is my chief occupation."(231)

SIGNIFICANCE OF LETTERS TO LISELOTTE

For a woman in seventeenth-century France, letter-writing was the only acceptable medium she had to express herself. Margaret Cavendish, though writing from slightly different circumstances in England, explained their situation clearly: "...since all heroic actions, public employments, powerful governments and eloquent pleadings are denied our sex in this age, or at least would be condemned for want of virtue, is the cause I write so much."[5] Liselotte and her contemporaries were writing for personal reasons and received no financial compensation for their work, yet, these women did make a kind of "profession" out of correspondence. Like any other profession, their writing consumed a great deal of their time. If the letters were circulated, they could earn the authoress fame and respect. The letters of Mme. de Sevigne, for example, were so well-written and in tune with the latest happenings of the French nobility, they were circulated at court.[6]

Although equally informative, time-consuming, and intelligently written, Liselotte's letters differed from those of her contemporaries in several respects. She did not write with the intention or the option of having her letters circulated--no member of the royal family was permitted to publish.[7] Liselotte's purpose in writing was two-fold. She used her letters to provide her audience (primarily her female relatives in Germany) with a realistic portrayal of her frustrations with life at Versailles. Letters enabled her to put to paper "what lips cannot say,"(100) for the women around her did not share her frustrations. In a letter dated 1683, she lamented to Sophie, "If only there were a single soul to whom I could open my heart."(42) Liselotte also used her letters to indirectly announce her unhappiness to other members at court. As early as 1682, Liselotte was "quite certain that my letters are being read and opened."(34) She took advantage of the fact that her letters were being intercepted to use them to call attention to the status of women. In 1702, she wrote: "I have been warned that the people who read my letters are making rather strange comments about them... Will the gentleman who translates from the German please translate this carefully, so that the ministers know exactly how I feel."(146) Liselotte was intent on making her dissatisfaction known.[8]

LISELOTTE'S FRUSTRATIONS WITH COURT LIFE

Forster suggests that one of Liselotte's greatest frustrations was that she was not born a man. Although she explicitly stated this only once, in a letter dated 1718, it is evident that she felt life would have been significantly easier had she not been a woman. Women were expected to defer to men, to be demure, and to occupy themselves with gentle-work, not intellectual pursuits. At Versailles, there is no place for tomboys, or "leaf-rustlers" as she referred to herself and her daughter. Liselotte realized her daughter was as vivacious as she and worried that she would be in for a difficult time at Versailles. For her daughter's sake she stated: "I wish that she and her brother could swap temperaments, for while he is also bright, he is as staid and proper as a girl should be, and she is as wild as a boy."(42) Liselotte learned the hard way that life is difficult if one does not adhere to the commonly held notions about what a woman should do.

Her description of her dispute with her husband over his choice of their son's tutor is a compelling example of the consequences she faced when challenging the expectation of female deference. Her husband had chosen a close friend of his, a man of whom Liselotte heartily disapproved. In a letter to her Aunt Sophie, Liselotte described how she first tried to reason with her husband: "This man is one of the most disreputable and debauched characters in the world... there is no greater sodomist in all of France than he, and it would be a bad beginning for a young prince to start his life with the worst debauchery imaginable... I also pointed out to Monsieur (her husbands's official title) that I had other reasons to ask him not to entrust my son to his man..." But her husband refused to be reasoned with. He warned her that if she "should remain stubborn and say that this is being done against my will, it would happen anyway, the only difference being that he would make life miserable for me... and thereby show that he was master in his own house." Evidently, her husband considered her actions and her attempt to assert her opinion to be a threat to his manhood. Liselotte realized this and was conscious of the fact that, as a woman, she had little recourse. She continued, "I granted that Monsieur is the lord and master and that he can place my son in the hands of anybody he sees fit... there is little I can do."(65-67) In order for her to exert influence, she depended upon a man to intercede on her behalf. She took her case to the King, first in writing, then in person. She managed to convince the King of the significance of the choice of her son's tutor and ultimately she succeeded in having another man appointed to the position.

Liselotte described her situation at Versailles as one of "continuous constraint." Her chief complaints were "always having to do what others want...not being able to travel without the king...never having any money." Aside from the restriction on travel, which was applied to everyone at court,[9] Liselotte listed restrictions that applied only to women. Society was constructed so that a man's interests were put before a woman's. She explained to Sophie: "French marriage-contracts are drawn up in such a way that whatever comes to the wife during the husband's lifetime also belongs to the husband, [he] can do with it and manage it as he sees fit, and the wife has no right to get upset."(50) But, Liselotte did get quite upset. She lamented, "Whenever the King gives me something, I must pay my old debts, and he never gives me anything except at New Years, and Monsieur never gives me a single ducat."(64) In a later letter she wrote, "I seem destined to lose everything that I should get from my family...all the money Monsieur has taken unto himself without giving me a red farthing of it."(68)

Liselotte also encountered difficulty in expressing herself and related how she was "chastised for speaking too freely."(43) She stated, "I don't know how to dissimulate, but I do know how to keep quiet. Therefore, if I am not to say what I think, I must not be made to speak."(60) She was even warned by the court censor that certain topics were inappropriate for letters. She managed to circumvent this by bypassing the official post, whenever possible she sent letters with Germans who were visiting court. In these she is much more free with what she writes. "In the mail I should not dare to put down such outrageous things as are written in this letter." (35)

As she related her experiences as a woman, she portrayed herself as subject to censorship, constraint, and a great deal of discrimination on the basis of her gender. She was very aware that males and females were subject to different standards. She wrote of a world in which women must spend their time "being bored and pregnant," husbands are acknowledged as "master," of a world in which "among ten thousand, one barely finds [a husband] who does not love someone other than his wife." She deplored the double standard of morality which was the norm at Versailles. "Does the young Duchess not know that a woman's honor consists of having commerce with no one but her husband, and that for a man it is not shameful for a man to have mistresses?"(87)

LISELOTTE'S CRITICISM OF THE WOMEN AT COURT

According to Liselotte, the other women at court willingly complied with these expectations and double standards, and she repeatedly expressed her frustrations with them. She criticized their 'loose' morals and preoccupation with their appearance. She poked fun at their elaborate costumes, penchant for wigs, and their preoccupation with being *a la mode*. Liselotte's criticisms stemmed from her desire to disprove the negative stereotypes attached to her gender. While the courtesans sought to exert influence though their feminine wiles, Liselotte viewed such behavior as reinforcing the beliefs that women had a stronger sex drive, were less able to control it, and that women were ruled by their emotions instead of by reason.[10] Liselotte felt that the behavior of the women at court compromised any chance for her gender to be taken seriously. Instead of sensuous creatures, she wanted women to be viewed as sensible beings. Liselotte's conception of what a woman's role should be was in direct conflict with how other women viewed that role. In fact, her call for greater independence and equal status threatened their greatest area of influence--the bedroom. These threatened women constitute a large part of those to whom she referred as her "enemies at court."

Liselotte considered her "greatest enemy" to be the King's mistress, Madame de Maintenon. For her Liselotte reserved her most scathing criticisms and insults. She wrote of de Maintenon, "I do not believe that a more wicked devil can be found in the world than she is, for all of her piety and hypocrisy, and I find that she is a fine example of the old German proverb 'Where the devil cannot go, he sends an old woman.' All the trouble comes from this slut."(68) Liselotte was referring to the influence that de Maintenon exercised over the King via her role as his sexual partner and religious confidante. Liselotte gave several examples of how his mistress influenced the King's decisions. He received his ministers and conducted affairs of state from her apartments. Liselotte wrote, "The King does only what his old trollop wants and will hate even those whom he loves most if she says so." In fact, Liselotte repeatedly claimed that de Maintenon hated her and used her influence to turn the King against her. Because she operated in the traditional realms of feminine influence, it would stand to reason that de Maintenon had a great deal to lose from Liselotte's attempts to change the status of women. As discreet and well-behaved as Liselotte was conspicuous and unconventional, de Maintenon's lifestyle was in every way antithetical to Liselotte's. It represented the very epitome of what Liselotte criticized. Their mutual animosity comes through in a letter Liselotte wrote to her aunt: "She cannot do me any worse harm than she has already done me and I hope it will be enough to make her go to hell."(87)

Although Liselotte would never openly admit to it, it is obvious she considered de Maintenon competition for the King's attention. Liselotte was not interested in the King as a love-object, as some historians have suggested, but rather as an instrument of power.[11] As seen in the example of the dispute over her son's tutor, Louis XIV was her only recourse, and she was extremely concerned with maintaining access to him. Openly disdaining religion and sex as a means of feminine influence, she sought to win the King's favor through activities normally associated with males! She gave many examples of hunting trips she took with him, the bawdy stories she exchanged, and her frequent attempts to engage him in stimulating conversations. Liselotte's contempt and frustration with the traditional options given to women, led her to disdain the feminine, not because it was ineffective, but because it kept women in a subordinate position.

Liselotte felt women were treated as being less valuable and less important than men in part because they were not permitted to live fulfilling lives. In Liselotte's world there were only several options open to a woman: wife, mistress, nun, or old maid. All were defined according to their relationship to men and none were a satisfactory option to Liselotte. She was very critical of the institution of marriage: "One who is eager to marry had better not consult me, for I never advocated the married state." In her eyes, women seemed to get the raw end of the deal. It is rare "if a spouse is given a comfortable livelihood and if she is not pestered."(92) She viewed convents as a type of banishment. Upon learning of her husband's death, she went into hysterics, shrieking "no convent, no convent!"[12] She feared that she had lost her position at court, was now unwanted, and would be sent to a convent where she would be out of the way. Liselotte saw convents as a place where women were sent in times of crisis, when either they are too much for the outside world or the world is too much for them. Society did not esteem unmarried women. She wrote that her father "had me on his hands and was afraid I'd become a little old maid, and got rid of me as quickly as he could."(137) Being someone's mistress was absolutely intolerable to Liselotte, who observed a strict morality. According to her, the options open to women did not allow them to serve any useful function.

LISELOTTE'S SUGGESTIONS FOR IMPROVING THE STATUS OF WOMEN

In an especially revealing letter written on the occasion of her son's becoming regent, Liselotte made several statements regarding what she felt the proper role of women should be. "I am extremely concerned that it might be thought that my son is ruled by women and therefore, in order to set an example to his wife and daughters, I have announced loudly that I will not meddle in any of his affairs." She concluded the letter by stating "It's time to let menfolks have their way."(204) Her remarks are puzzling because they border on misogynistic. In a sense they are, for she did harbor a great deal of ill-will towards the type of women found at court. But Liselotte did not harbor ill-will towards womankind in general. If we consider the context in which the statement is made, we realize that she was actually urging women to find alternative means to assert themselves. She wanted women to exert influence in areas that were not, as politics was, hopelessly male-dominated. She intended her legitimate and insightful observations to be taken as constructive criticism.

How did Liselotte make her sentiments known at Versailles? It is somewhat ironic that her letters, normally private documents, became a public forum. She took full advantage of the fact that her letters were being read by censors. Instead of deterring her from speaking her mind, this knowledge lead Liselotte to put in asides such as this one addressed to Madame de Maintenon: "I have no reason to treat her gently, and if she should open this letter, she will find a few home truths."(87) Contained in Liselotte's letters is a very definite message to the women at Versailles. She exhorts them to do as she does: to assert themselves, to be independent, and to exercise individuality.

Liselotte's observations lead her to take an active role in trying to correct how gender was constructed at court. She sought to discredit the current system, challenging the traditional expectations of women with her unconventional lifestyle. Perhaps the most obvious means she used was to exhibit decidedly unladylike behavior. In speech she was coarse and bawdy. She would not dance or play cards, complained about the endless official functions, and schemed to get out of attending them. Her love of hunting was accompanied by her lack of interest in gentle crafts. "I have no skill and desire for fancy-work and nothing in the world bores me as much as sticking in a sewing needle and pulling it out again."(231) Liselotte prided herself on being "hideously ugly, but fortunately for me I do not care one whit."(217) Not considered beautiful by court standards, she even refused to make efforts to enhance her appearance. Despite being the second-highest ranking woman at court, she owned only three dresses![11] Nor did she enjoy associating with her contemporaries after hours. "I never go to the salon where all those who are at court assemble."(196) These were just a few of the ways she dissociated herself with from the typical conception of how women at Versailles were expected to behave.

Eventually, Liselotte retreated, in both a physical and a figurative sense, from court life into a world she could structure to her own liking. In 1698, she wrote, "Here at this great court, I have well nigh turned myself into a hermit, and there are not many people in the country with whom I keep steady company, and I spend long days all alone in my sitting room, where I occupy myself with reading and writing."(108) In contrast to the context of Versailles, her letters afforded her a world with familiar customs and whose inhabitants shared similar sentiments. It was a world in which she was able to express herself which much less inhibition.

Liselotte's letters testify to her struggle to be an individual in an atmosphere which insisted upon conformity. She did not wallow in the misery of being *Madame*. In fact, she was not even a very good one, according to seventeenth-century standards. But Liselotte lived her life according to her own standards, and not the standards that were normally imposed upon her gender. Her letters reveal how confining life was for women at Versailles. Through them, she attempted to broaden the spheres of activities traditionally open to women and to create an existence for herself, independent of the influence of men. Liselotte's letters contain the testimony of a woman who refused to conform to the lifestyle of Versailles. Her correspondence was a means of escape, a means to retain her dignity, and the only way she had to express herself.

FENCING OUT THE FOREIGNER: INFLUENCES ON THE EIGHTEENTH LEGISLATURE OF WYOMING AND ITS EXCLUSION OF FOREIGN PHYSICIANS

Susan Macki

THE NATIONAL SITUATION IN THE 1920'S

Many Americans became intensely isolationist in their political philosophies during the interval between the World Wars.[1] The fear of the foreigner that had been held in *some* abeyance before World War I came into full bloom in the heartland of America in the 1920's. Wyoming did not escape the influence of this national paranoia, and indeed, had its own proselytizers of opposition to immigration and of the 100% American movement. The propagators of mistrust and prejudice did not do so under the guise of a secret organization, although there is some evidence of Klan activity in Wyoming at the time.[2] Rather, they were confident that they formed a majority, and confident of the propriety of their insular movements within Wyoming and the nation.[3] These movements led directly to the banning of foreign physicians and to the unintended exclusion of the children of "undesirable" foreigners from medical practice in Wyoming.

Of primary significance in this period was the re-organization of the medical profession begun in the earlier part of the century under the auspices of the Rockefeller Foundation.[4] John D. Rockefeller authorized what is known as "The Flexner Report," which gave a scathing account of the situation in the medical schools, and advocated a blueprint to upgrade the quality of medical education in the United States. It advocated that only the allopathic or biochemically based branch of the medical profession to be considered legitimate, and favored the banning of chiropractors, homeopaths and natropaths. With this end in mind, the American Medical Association (AMA) began to rate medical schools, and classify them according to stringent rules.[5] There was also a media campaign to expose quackery (which was anyone in disagreement with the medical profession as they saw it) and to organize the pharmaceutical profession.[6] The plan entailed prohibiting patent medicines and what was at the time traditional herbal medical treatment that did not involve payment to an AMA approved physician.[7] This push by the AMA led to the lobbying of the state legislatures to enact medical licensing laws.[8]

The AMA was also concerned in this period with what they called the "quality" of the medical students and physicians. This is where the pseudo-science of Social Darwinism and Biological Determinism so prevalent and widely publicized in the history of Europe, but ignored by many of the historians of the United States, came into play.[9] For example, in the 1920 keynote address of the AMA convention by the then Surgeon General of the United States W. C. Braisted, who was also President of the AMA, there is much evidence of the philosophy of Social Darwinism and Biological Determinism. He discussed the "physical integrity" of the American race as a necessity for "survival in its struggles with its rivals" for example, a direct line of thought in the "survival of the fittest" philosophy.[10] He went on later to say that owing to the World War I draft law, medicine had discovered that the "white" race was weakening due to its low birth rate and physical defects found. He also advocated an investigation into the background of medical school applicants to ascertain their fitness for medical education. This, he stated, was to keep diplomas from being awarded to " physical or moral runts." He finished with a diatribe against medical students whose main disqualification is that they did not speak "proper English." The qualification of English as the primary language of a student, spoken without an accent, would exclude many applicants of foreign extraction, and some of their descendants, and would also exclude Americans not of the "privileged class" that the medical schools were now aiming at recruiting.[11]

Medical schools also began to institute quotas based on the ethnic backgrounds of their applicants during this period.[12] It was part of the effort to "upgrade" the practice of medicine in America, and limit what was to them the undesirable element admitted to their profession as well. The quota system had devastating effects on the children of immigrants. These second generation Americans were virtually ostracized from the medical profession. For instance, at Columbia University Medical School 40% of its 1920 graduates were of Jewish and Eastern European lineage. By 1922, this percentage decreased to 20%. By 1930, the medical schools and universities across America had effectively barred the "undesirables" except a small percentage.[13] It was not the immigrants themselves that these Protestant white Anglo-Saxon Americans were ultimately discriminating against, but their children, American citizens all. Many applicants who were turned down did not give up their dream of becoming physicians. Instead, they went to Europe to study. When they came home to the states, they were once again considered a competitive threat within the medical profession, and this is one of the central reasons for excluding foreign physicians and foreign educated ones in various states. It came down to who was going to acquire the American citizens enduring medical dollar.

THE SITUATION IN WYOMING IN THE 1920'S

Wyoming was not nearly as impacted by immigration as some other states, but it still felt similar pressures. There were many enclaves of foreigners in places like Rock Springs and many of the mining communities around the state.[14] Some of the other towns, such as Laramie, had large (for Wyoming) immigrant populations. This led to the undertaking by the University Of Wyoming of what came to be called Americanization classes, taught by Grace Raymond Hebard, then head of the Political Science department.

Grace Hebard was the most influential woman in Wyoming at the time. She was head and founder of the Wyoming chapter of the Daughters of the American Revolution,[15] and had many other influential connections in the state. She was also close to many of the Republican leaders in the state. Her opinions were sought after by the state and the national representatives of the people of Wyoming. Legislation was submitted to her for comment well *before* it was even considered by the Senate or the House in Wyoming. [16]This included the legislation passed in the Eighteenth State Legislature concerning the citizenship of physicians.

Miss Hebard had much to say in many forums around Wyoming about the "racial characteristics" of the recent immigrant population.[17] She believed that the Nordic race was the bearer of the superior attributes needed by America, and that the people of the "alpine" and "Mediterranean" stock were much less desirable.[18] This belief system was first outlined in William Z. Ripley's *The Races Of Europe*.[19]The undesirables included Jews, Italians, Russians, Poles, and other Slavic nationalities. For example, in a talk given on the Nordic races, she cited many good characteristics of these Norsemen, and implied that the other peoples were "less compatible' with American ideals. She used Charles Lindbergh as the example of the desired "racial blood." His combination of Swedish, English and Irish blood made his "courageous deeds" possible, in Dr. Hebard's view.[20]

Miss Hebard instructed many classes especially designed for immigrants, but most of the immigrants she seemed to deal with were Canadian, Australian, English or German, all of the supposedly "better" races. Perhaps, as one researcher of Miss Hebard's life says, if she "knew more of them"[21] (the other nationalities) she would have changed her prejudicial bias. As it was, she actively supported the 1924 Reed-Johnson Bill in the U.S. Congress to limit the already restricted immigration even more.[22]

This prejudicial bias was encompassed by the nationwide idea of 100% Americanism. The 100% movement was put forward to preserve what was considered the "original" ideas and concepts of the founding fathers of America. It meant more than being native born. Catholics, Jews, and Negroes were not considered to be 100% Americans, no matter how long they had been living here.[23] The movement fed on many of Wyomingites fears. With the expansion in the mining industry came foreigners who were not assimilated, who spoke no English, and who were "different" from the small town provincial sons of the West. They were also in direct competition for jobs with limit foreign involvement in medicine was designed to solve in Wyoming.

Another critical aspect of the problem in Wyoming was powerful personages wanting the state's laws to be seen as being reciprocal with the laws in other states who were passing similar legislation. This push for standardization of medical licensure laws had been instigated by the AMA and the Rockefeller Foundation in the earlier years, and was coming to fruition at this time.[36] It remains to be investigated whether the Rockefeller Foundation had any influence in Wyoming on this matter. But there is evidence some doctors seemed to be well connected with the oil companies of the time. For instance, Dr. Earl Whedon of Sheridan was the secretary and head of the Medical Defense committee of the Medical Society Of Wyoming, a branch of the AMA. He also was heavily involved with then Rockefeller owned Standard Oil Company (until the TeaPot Dome scandal). He was also involved until the 1950's with many other oil related ventures.[37] These kinds of connections lead to speculation that more than the medical profession may have been considered when passing licensure laws in many states, not just Wyoming.

The new statutes also allowed for the "grandfathering" in of many physicians not practicing traditional medicine in Wyoming, such as chiropractors and homeopaths. This inclusive position had been adopted by the AMA as they imposed stricter standards on medical schools and encouraged more inflexible licensing laws.[38] In Wyoming, it obtained passage of a law requiring the physician to be a U.S. citizen. Six months later the Board Of Medical Examiners added a qualifier to the law: that the person seeking licensure must have graduated from a class "A" medical school.[39] It enabled the physicians in Wyoming who were non-traditional to become licensed, thereby squelching much of the opposition, and then it slammed the door on any new chiropractors and homeopaths.

It was just this type of law that prevented the children of immigrants, who had been virtually excluded from U.S. medical schools and been educated abroad, from the practice of medicine here in the United States. Their degrees would not be accepted in Wyoming or many other states because of these statutes. With these seemingly necessary statutes, Wyoming prevented a significant segment of the foreign born and their children from becoming physicians to the people of Wyoming.

THE SIGNIFICANCE OF STUDYING THE BACKGROUND OF LEGISLATION

It has been seventy odd years since this legislation was passed, and it has been revised many times since. Some Americans still evidence suspicion and alarm toward newly immigrated peoples and foreigners in general. The quota system instituted in the medical schools at the time does resemble the affirmative action quotas of the past twenty years, although they were instituted for differing purposes. Could they not have the same result? The affirmative action program in California has severely restricted Asian Americans from attending many schools, for example.

Immigration is once again being heavily attended to by the media. Legislation against the children of illegal aliens has been proposed in many forums in this country, including the U.S. Congress. California's Proposition 187 passed with an overwhelming majority. Our senators from Wyoming have sponsored new immigration laws in Congress. The reasoning behind many of these new laws bears a remarkable resemblance to the same sort of bias evidenced in the anti-immigrant arguments of the 1920's.

For example, in 1924 Senator Warren was on the committee to restrict immigration of the Japanese to this country. In a letter to M.C. Brown, he speculates on who will pick California's agricultural crops if the bill passes, as Americans are too busy and lazy to do this sort of work themselves.[40] This same sort of argument, only with the word Mexican substituted for Japanese can be heard today.

Wyoming's stricture against physicians who are not citizens, and who are not graduates of a class "A" medical school seems very provincial to people who think in terms of world economies and modern technologies. People are beginning to join together in a global village, one where nationalities may become insignificant. It remains to be seen what sort of village it will be, and who will remain outsiders to the general populace of a new form of American society. One lesson that studying this law of Wyoming may teach us as we become more diverse is that we must consider closely and returning soldiers after World War I. This led to culture conflicts in most of the places where large numbers of foreigners were working. It also led directly into the support given the 100% movement by the Ku Klux Klan.[24]

The Klan of the 1920's was indeed an "Invisible Empire." It had extended its grasp well beyond the deep South into the West and small town America. It was very influential to the south of Wyoming, with much of Colorado being controlled by the Klan in the 1920's.[25] It has been estimated that there were up to a million or more members in the west at the time.[26] It is very difficult to track its predominance in Wyoming, however, because it was less widespread and not as overtly organized.

Wyoming did have representation at some national Klan gatherings.[27] The women in the Klan felt secure enough to incorporate their organization in Cheyenne in the 1920's also.[28] So there were some indications that the Klan had an organization in Wyoming. They were also well enough accepted by mainstream Wyoming society to engage in correspondence with the then senator from Wyoming, Frances E. Warren. He was on the committee that was considering immigration law in the 1920's, and the Reed-Johnson Bill to limit immigration to 2% of the nationalities based on an 1890 census, or the 1910 census. The Klan was in favor of the 1890 census, as it was before large scale immigration from Eastern and Southern Europe began. Warren even said in a personal letter to Hiram Evans, Grand Kleagle of The Klan, that there was much "good food for thought" in the Klan's position on immigration.[29] Many other people in Wyoming also wrote the senator in support of the 1890 date for limits on immigration.[30]

Most Wyoming people would become familiar with the Klan's opinion's through the newspaper coverage of the Klan's trials and tribulations in other states.[31] Trials of Klan members for terrorism in Oklahoma and other localities were widely covered, with Wyoming newspapers allocating space to entire speeches by the leaders of the Klan. In one such article, the Klan position on immigration is given by the head of the Klan, the Grand Kleagle Hiram Evans:

"Our Cause is true Americanism. Our destiny is the common welfare, materially and mentally, physically and spiritually, upon a plane high above any mankind has ever known.... the time has come to look far beyond... to this greater American problem of our composite people. That is the bedrock of every national danger and hope. The streams of population that have been and are pouring in upon us are ages old in racial character and capacity. We are the melting pot. Into it has been poured, almost promiscuously, perhaps in recent years designedly, every dross ingredient of citizenship the earth produces, the good and the bad. Monthly the immigrant stream is more and more inferior...."[32]

Hiram Evans goes on in the article to describe Negroes as "savages," Jews as "never emerging for a real intermingling with America." Catholics are undesirable because they are "illiterate" and owe allegiance to Rome. This list of "undesirable aliens" given in the article according to the Klan creed also includes Greeks, Serbs, Rumanians and Bulgarians. Klan doctrine was obviously right in line with Grace Raymond Hebard's notions of nationalities and of the 100% American viewpoint. This anti-foreigner bias did carry over to the Wyoming legislature and the national legislature, as many anti-alien laws were passed in 1924-25.

Despite such pressures, there was no surplus of physicians in Wyoming or the nation, foreign or otherwise, during the 1920's.[33] At the same time the license requirements were being debated, the Wyoming legislature also was considering passing a requirement that three doctors be required to examine persons being admitted against their will to the state asylum for the insane at Evanston.[34] Meanwhile, judges in various counties protested that they did not have the resources or physicians available to them. The law was then changed to having the county coroner, one physician, and a disinterested party sign commitment papers.[35] If counties had problems finding three doctors to commit the insane, it did not make sense for the medical professionals of Wyoming to be in favor of laws limiting licensure. This was also the predicament in most of rural America, as many of the articles in the 1924-1925 AMA journals discuss. So a plethora of physicians that needed regulation was not a significant aspect of the reasoning behind the legislation or part of the genuine problem that the legislation to carefully whom our laws are designed to affect, and what powers they are constituted to protect. Indeed, such laws may reflect another agenda that is not as obvious or as encompassing of the various Wyoming constituents as it seems.

A Woman's Place:
Female Tavern and Inn Keepers in Early Pennsylvania

Sarah E. Morgan

Department of History
Widener University

Chester, PA 19013

Faculty Advisor:

Dr. Larry Eldridge

ABSTRACT

Drawing extensively upon handwritten 18th century court records and other original documents, as well as upon important recent works in early American women's history, this paper explores the lives and work of women who operated taverns in early Pennsylvania. What were these women's lives like? What was the nature of their work? What advantages and obstacles did they encounter as a result of their gender? In what ways did their lives of relative independence challenge prevailing attitudes about women's "place" in society? And how did their circumstances change with the profound changes that marked 18th century America? This paper explores these intriguing questions.

Focusing on 18th and 19th century Chester County, Pennsylvania, this paper explores taverns and inns in early America and women's roles within them. The work draws upon a wide range of secondary sources and original, handwritten court records from the period.

In early America, taverns provided food, alcoholic drink and lodging for travelers, all for a price. Depending upon the particular tavern and the season, visitors ate pork, fresh fish and fowl, eggs and cheese. Liquor of all kinds was available as well, from flip (a mixture of wine, sugar and molasses), to whiskey, beer, and grog (a mixture of rum and water, and perhaps the origin of our term "groggy").

Taverns also generally functioned as the center of the community. In addition to providing entertainment, taverns were commonly the site of local auctions and government proceedings, including court trials and town meetings. Most importantly, these establishments were gathering places where the latest news could always be learned. Colonial laws typically required each town to build and maintain a tavern. As William Penn noted, in early America taverns were "a public service."[1]

Of course, as Penn also observed, such establishments had to "be regulated by law to prevent abuses."[2] Authorities limited, for example, how long an individual could remain in a tavern and how much one could consume. Prices were regulated and adjusted annually, and courts standardized the amount of alcohol per drink.[3] Perhaps the most obvious and important regulation came with licensing. In licensing taverns, authorities considered not only the personal character and financial stability of the prospective operator, but also the suitability of the proposed location.[4]

There were various types of taverns, each with distinctive names indicating specialized functions. "Ordinaries" were primarily eating establishments. "Inns," usually located in rural areas, provided lodging for extended periods of time, longer than the typical one or two night stay. "Tippling houses" were shady establishments operating at the edge of the law. A good example is the Chester County tippling house operated by Hannah Thompson. During the 1760s, she appeared in court a total of ten times in just three years for the activities there. When licensed at all, such places were often closed down because of gambling, raucous behavior and the like.[5]

Regardless of the type of establishment, each had its own character which reflected the clientele. The names of the taverns were often revealing in this regard. The "Royal Standard" and the "Rose and Crown" catered to upper class Philadelphians. A roost for the lower sort was provided by the "Hen and the Chicken," another Philadelphia establishment.[6] Bright, colorful signs were hung outside of taverns to catch the eye of those passing by and to help individuals who were illiterate.

What role did women play in the taverns? In early America, as in England, married woman were completely subordinate in law. They could not make contracts, own businesses, or even call property their own without special arrangements. In the words of Sir William Blackstone, married women were in a condition of *feme covert*, whereby "the husband and wife were one person in law," and that person was the man, "...under whose wing, protection, and cover she performs everything."[7] This did not apply to single women, whether divorced, widowed, or never married. Their status was known as *feme sole*. Such women enjoyed the same legal rights as men, including the right to have their own businesses. A good case illustrating the difference between *feme covert* and *feme sole* status is that of Mary King. A resident of Radnor, Pennsylvania, she twice petitioned for a tavern license in 1786. During her first try, she did not mention that she was a widow and the court denied her request. Later that year, Mrs. King noted that she was a widow and authorities immediately granted the license.[8]

Widows in particular owned and operated taverns. Authorities were especially concerned that such women would not become public charges after their husbands died. Tavern operation required cooking, cleaning and serving - skills presumably possessed by women, especially those who had once been married. Given these circumstances, it is perhaps not surprising that in early New England 71% of the taverns were operated by women, and that women owned at least one in five Philadelphia taverns at the time of the American Revolution.[9]

Thus, women were thought to be well-suited to tavern keeping and for the most part they fulfilled the definition of a positive and successful tavern owner, one who was "orderly, honest, temperate and an outstanding citizen."[10] However, not all of the women tavern owners in Chester County lived up to this model. Between 1700 and 1860, approximately 100 women went to court for tippling, selling alcohol without proper licenses, running disorderly houses, or selling liquor on Sundays or to minors. While few licenses were revoked, most of these women did pay fines, and a few even went to jail.

Sometimes women were charged simply with tippling - operating a tavern without a license. The widow Priscilla Robertson, for example, was charged in 1828 with keeping "a Tippling-house, without any License so to do," where she "did retail... to sundry Persons, divers Quantities of Rum, Wine, Brandy,... and other Spirituous Liquors...." Several witnesses testified against the widow Robertson and the court convicted her. She was fined $20 and paid court costs.[11]

Other women were charged with offenses that occurred within licensed taverns. In 1814, for example, Jane Mercer was given the choice of jail or a fine after being convicted of selling spirituous liquors in quantities "by less Measures than one Quart." Avoiding jail, she paid $26.60 to the Commonwealth of Pennsylvania. The case was unusual because she was a married woman, yet the tavern license was in her name. *Feme sole* status would ordinarily have precluded that, unless she had owned the tavern before marrying John Mercer.[12]

In early America, as now, selling alcohol to minors was a problem. In July of 1854, Catherine Russell went to court in Chester County for this offense, eventually paying fines and court fees totalling $100. She also lost her license to operate a tavern. Two years later, her husband was charged with the same offense, but was acquitted.[13]

BEST COPY AVAILABLE

Mary Cook and Sarah Sperry were involved in other offenses. In 1741, Cook was arrested and fined for her excessive hospitality. It seems that she kept a disorderly tavern that was frequented by "whores, vagabonds, and idle men."[14] A warrant went out for Sarah Sperry's arrest in 1814 after she sold liquor on Sunday "against the Peace and Dignity of the Commonwealth of Pennsylvania." Rather than face the charge, she ran away, but returned the following year and paid her fine.[15]

Some women had a long history of offenses related to tavern operation. The widow Ann McCaffery was such a woman. She appeared in court at least ten times during the 1850s, paying hundreds of dollars in fines and bonds. She repeatedly sold strong drink to minors, and ran her tavern without a license as a gathering place for drifters and women of ill repute.[16]

Taverns had an interesting impact on life in the early colonies. From the evidence obtained in Chester County, in addition to what scholars have learned about other areas, in many ways women's experiences were remarkably similar to men's. Like men, they owned and operated taverns. Like men, they found themselves in trouble with the law from time to time. And like men, they were punished when they disobeyed the law. The patterns of prosecution were much the same from 1700 to 1860, regardless of gender. Most years brought relatively few tavern-related prosecutions, but these escalated dramatically during the 1850s in response to reform pressures related to drinking and drunkenness.

Women tavern owners also shared daily life experiences with men - buying, selling, trading, keeping accounts, dealing with rules and regulations, and so on. To this extent, they differed from most of their female counterparts who did not find themselves so deeply or directly involved in the "world of men."

As the nineteenth century progressed, women operated fewer taverns. As one scholar has noted, "there were more women merchants and tavern owners, proportionally, [in the 18th century] than there were in the 19th...."[17] This reflected trends that steadily narrowed women's opportunities in the 19th century, and increasingly created for them "a woman's place" more exclusively in the home.

ACKNOWLEDGMENTS

I wish to thank archivist Laurie Roffini and the entire staff of the Chester County Archives, West Chester, Pennsylvania, for their kind assistance in helping me find the original criminal court dockets and case papers necessary to complete this paper.

The Debates and Arguments Leading to the Passage of the Seventeenth Amendment

Deborah A. Rosen

The Seventeenth Amendment provides for the direct election of United States senators by popular vote. Prior to this amendment, the State Legislatures chose the senators to represent the state. The debates on the issue of directly electing U.S. senators has existed in the House of Representatives since 1893. This paper will describe the various arguments made for and against the proposed amendment between 1893 and 1913. This paper will focus in particular on the reasons why this amendment succeeded in Congress in 1912, and how the Progressive movement ideals factored into the final passage.

The Seventeenth Amendment of the United States Constitution was an important change in the structure of the federal government. Before the Seventeenth Amendment was passed, each state legislature chose the United States senators to represent their state in the federal government. The Seventeenth Amendment, which was ratified in 1913, allows for the direct election of United States senators by popular vote. This method puts control into the hands of the people.

At the time of the passage of the Seventeenth Amendment, the Progressive Era was a major movement that was sweeping the country. Within this movement, the push for more democracy and a return of the government to the people was what finally inspired passage of the Seventeenth Amendment.

The Progressive Era focused on restoring good government, giving the government back to the people, and taking corruption and political machines out of the political process that ran the country.[1] The early 20th century was the reform era that generated the idea of giving the people more say in their government, in part through the direct election of their senators.

Although the idea of direct election of senators was not in the forefront of political reform thought, the concept of it had been in existence since the late nineteenth century. Some form of popular election of senators was introduced into Congress every year since 1893. So, the idea was not solely a Progressive one. It came about as a result of people questioning state sovereignty and its role in the protection of democracy.

An amendment to the Constitution of the United States to provide for the direct election of United States senators was debated in the House of Representatives as far back as 1893. In actuality, the idea had existed since 1826. It was not until 1893, though, that the notion to propose an amendment to the Constitution in regards to electing senators came to the House floor. In each year thereafter, the House introduced and passed such a resolution, which was then sent to the Senate, where the matter was not acted upon, and thus did not become an amendment.[2]

The early mentions of such an amendment appearing in 1894, from the Congressional Records of the House, indicate that Congressman DeArmond from Missouri argued that the very idea of proposing an amendment to change the way the election of senators was conducted should come from the people and not from party factions. DeArmond argued that the people should have the right to choose their senators, which would result in a far more representative body.[3]

In the debate on July 20, 1894, it was argued that the notion of direct election of senators was already debated and resulted in the Constitutional Convention of 1787.[4] The method that was used to elect senators was a compromise agreed upon by the founding fathers and not to be meddled with. In particular, it was argued that it was against the founding fathers' principle of separation of powers.[5] Never before had the present government gone against the very set-up of government that was developed in 1787. Due to that fact, many did not directly favor the proposed amendment.

A rebuttal to this argument was made by Senator Turpie, from Indiana, in December of 1894. He argued that the country does not have to stick to what the founding fathers devised. They gave the House of Representatives to the people, why should they not give the Senate as well. "The people are the source of all power," he said. "Why should not we as lawgivers spring directly from that source?" Mr. Turpie argued on behalf of the amendment to allow for direct election of senators by the people.[6]

Mr. Turpie furthered his argument in support of the amendment to the Constitution to directly elect senators by the people by presenting the fact that several times state legislatures spent their entire sessions attempting to elect a senator and, therefore, neglected their duties to the state. Sometimes, the state legislature even failed to elect a senator.[7] The new method proposed would eliminate the need for state legislatures to give up their primary responsibilities to focus on national matters.

Even two years later, Mr. Turpie was still arguing his case for this amendment. In 1896, on the Senate floor, he argued that the time had come to diverge from the founding fathers' set-up of government:

> It is now time for us to pay a rational deference and respect to the memory of our ancestors, not by adhering to what they under different and other circumstances did, but by doing what they would have done under our present conditions.[8]

The founding fathers developed a government that would grow with time and advance with the people. In order to do this, the amendment process was developed to change the government to allow for it to grow and advance with modern times. The concept of an amendment to allow for the direct election of senators is exactly the type of change that the founding fathers allowed for in creating the amendment procedure, Turpie said.[9]

The same arguments were still around in the early 20th century that existed in the late 19th century concerning the resolution to directly elect senators.

In 1908, on the Senate floor, all the reasons to support the direct election of senators that had come up in the House through the years were brought into the light once again. This time, it was Senator Owen from Oklahoma who brought to the attention of the Senate all the states that had passed resolutions in favor of electing senators by direct vote:[10]

> Mr. President, here are the legislatures of twenty-seven States of this Union who have requested this reform, ... I call upon you ... to respond to the will of the people of this country, and more, to respond to the principles of righteousness which ought to prevail and which will prevail when the great people of this country are allowed a free expression of their will in electing Senators by direct vote of the people.[11]

Mr. Owen pointed out the obvious fact that this amendment was something that the people wanted and were asking for. The states were responding to the people; the federal government should do so also.

The argument that arose in 1908 against the resolution to directly elect senators was that it would give the power to elect the senators to the people, and it was not known whether the people were capable of such a task. Many were still afraid to allow the people to have a direct say in the way the government was run.

This proposed amendment would create a drastic change in the set-up of government and naturally it was confusing to the public, as well as to the congressmen themselves. In order to help explain this proposed amendment and to keep the public informed, *The New York Times* covered the progress and the debates concerning this issue. The amount of coverage the newspaper devoted to this issue increased as popular support for it increased in the early 1900s.

The public stayed informed about this issue through magazines as well. Articles in popular magazines took the ideas that came from the arguments and debates in Congress, expanded them, and used them to further educate the public on this matter.

This can be seen in an article written in 1902, which favored taking the election of senators off the agenda of state legislatures. Charles Fox's words echo the argument made in 1894:

> This new method of electing Senators would be very beneficial to the State legislatures. These are elected primarily to consider local and State affairs, and it is better that they should not be hampered with national obligations.[12]

Not only did magazines express support for the amendment, they also printed the arguments against such an amendment, much the same way as the debates went on in Congress. In 1911, as the final push for the passage of this amendment was underway, there still was opposition coming from Congress as well as from the public. Public opposition dealt with the notion of whether the average citizen was capable of making an intelligent choice if given the chance to actually elect a United States senator.

The road to passage of the amendment to directly elect senators by popular vote was a long, controversial one. It is evident by all the arguments made either in support for it or against it. It took many years for each house of Congress to pass the resolution, and then to finally agree on the same principle and language of the resolution to finally pass the amendment by both houses.

It was a resolution added to the direct election of senators resolution that was holding up the passage of this amendment. In 1912, an agreement was reached, called the Bristow Amendment, which allowed for the amendment to get passed. The Bristow Amendment affected section 3 of Article 1 of the Constitution; it provided that "The Senate of the United States shall be composed of two Senators from each State chosen at a general election by the electors thereof for a term of six years."[13]

The House and the Senate agreed on the same resolution, after going through numerous amendment processes on the resolution. After much debate over the issue and what exactly should be included in the amendment to allow for the direct election of senators, it was passed by both houses of Congress on May 13, 1912.[14]

The Seventeenth Amendment, which it was to be called, outlined the process of directly electing United States senators by popular vote of the people. This amendment gives the people the right to vote directly for their United States senators. This amendment also gives the power of conducting U.S. senatorial elections to the states and gives them the authority to set qualifications for those who want to run for the Senate, as well as fill any vacant seats that might occur due to death while in office or if someone resigns his office.

In essence, the Seventeenth Amendment at the same time took power away from the states, but also gave them power. This happened in different forms, though. It took power away from the state legislatures and gave more power to the state executive branch.

This amendment took power away from the political machines that had a huge influence within state politics, that carried onto the national level. As John Buenker interpreted in his analysis of the passage of this amendment:

> Representing one of the major constitutional changes in twentieth-century America, the direct election of United States Senators is usually depicted as a victory of middle-class progressive reformers over the immigrant-dominated, boss-controlled urban political machines.[15]

After much debate and after several decades, the 62nd Congress passed the Seventeenth Amendment. Once the amendment was proposed by Congress on May 13, 1912, it then had to go to the states for ratification. The ratification process took a little less than one year, in which thirty-six of the forty-eight states ratified the amendment. This occurred by April of 1913. On May 31, 1913, the Secretary of State declared in a proclamation that the Seventeenth Amendment was now a national law.[16]

The public appeals for this amendment are quite obvious throughout the twenty-year push for the direct election of senators. The reasoning behind the reluctance of the government to act on these appeals is not quite clear on the surface. Below the surface there are reasons why the government would not want to change its structure. One of the main reasons, I believe, is that those in government would not want to make a law changing the way they are elected. This reasoning is probably most evident in the Senate, since it is the senators who were most affected by this amendment. The Senate was reluctant to act on the early public appeals due to this fact. It is not until the Progressive Era, in which public support and appeals grew, and it was obvious that some change would take place, that the Senate reluctantly agreed to this amendment.

The House of Representative members really pushed for this amendment because it did not truly affect their role in government. They were elected by the people, and subjected to them, so they supported the notion that senators should be subjected to the same things the House was subjected to. The Senate debated this issue for a long time and tried to put it off as long as possible, for fear that they would have to appeal to the people and be held accountable to them.

The Seventeenth Amendment was passed in 1912 because it was during the height of the Progressive movement, and Congress was acting responsibly towards the people. Since the debate over this proposal existed for twenty years and more, the logical conclusion that I can come up with as to why the amendment was passed in 1912 and not in any other year, is that it was a by-product of the reform movement in America in that decade.

Through the twenty-plus years that this issue was thought of and debated, the arguments for this proposal grew in strength and culminated in the first decade of the 1900s with a very strong argument for the passage of such an amendment. Because in the end the issue had such a strong argument and a solid case, and almost nation-wide support, Congress really had

BEST COPY AVAILABLE

no other choice. Popular choice of senators was becoming the rule in many states, even without a constitutional amendment. There were many states in 1912 that already had some form of popular choice of senators enacted.[17]

This constitutional amendment gave the government back to the people. It made Congress more accountable to the public, and it further restored the confidence and prestige that people had once held for their government.

On April 8, 1913, the Seventeenth Amendment was successfully ratified. On May 31, 1913, the Seventeenth Amendment was the successful culmination of twenty years of debate over the issue as to whether the fundamental set-up of Congress should be altered.

Jane Addams: Woman-Based Political Actor as Role Model

Suzan Harrison

Jane Addams' vision of women's community spanned from the formation of Hull-House in 1889 to her Nobel Peace Prize in 1931. The women's community of Hull-House was made up-of white, college-educated American women, and newly arrived immigrant women. The unification of these two groups was her basis for creating the community at Hull-House. In this paper I examine the links between Jane Addams' experiences at Hull-House and women's community, with the inception of the Women's International League for Peace and Freedom. I focus on the relationship between her creation of community, her active role as a peace leader, and her support of the idea of the League of Nations.

Jane Addams stands in the "Octagon room" of Hull-House surrounded by maps of the districts' racial lines and numbers, surrounded by the rooms of ethnic divergences, and surrounded by the echoes of displacement and the creative energy of voiced change. In the parlor near the kitchen, children play, but the lines that distinguish their identities diminish, and their play alleviates the residue of tension. And outside the wind howls long, unrelenting, and the stale air in her lungs goes unnoticed for there are more important things to do; the year is 1915, and her mind is filled with the upcoming peace activities she and her female colleagues are planning--colleagues, surprisingly, in twelve countries, women planning peace as they breathe the fear implicit in war. Remembering a time when the conception of Hull-House seemed radical enough to her, she sighs, and feels the immensity the Hague will represent. She envisions the many women convening for peace, organizing minds to put words onto paper and create a resolution to suggest to President Wilson. And this is new, an international voice of women moving together and supporting each other.

Wind from the opening door rushes by her legs, and her thoughts of Europe and the women's movement are interrupted; her other "job" calls. The newly arrived guests look cold and in need of food; Jane greets them and buries the red-faced child in her arms. The parents look frightened; it's the usual scared look, though, and Addams barely notices instead she moves them into the next room where a couch invites and books line one wall. Other women come in and begin to talk with the newly arrived, and Addams heads back into the kitchen to check on a screaming child scalded by water. The activity never ceases; the travel of people in and out means one must always be alert and flexible, compassionate and strong. Addams finally sees all is in control and returns to her planning. The room is darker, the light outside has shifted. She turns around, stout bodied, her strength manifest, and looks towards the window, her eyes sketched with the workings of a mind embodying the intelligence of the severely just and radical.

Generally Jane Addams is looked at through the lense of a dull historical perspective, a past social worker skimmed briefly in a textbook. Or if not "briefly," then she is denounced as unimportant; in Daniel Levine's book on Addams he writes of her triumphs, but ultimately derides and dismisses her, as can be seen here, " Jane Addams was not an original thinker of major importance" (Levine, x). But my interest in her focuses on Jane Addams as a living being "of importance," and in Elshtain's words, "I shall reflect on hers as a lived life" (257). I am not interested in confining her to her past, boxing her into the stereotypical "social worker" or "settlement worker" description; nor will I "buy" Levine's reductive response to her work. I also want to suggest my place in looking at Addams, in learning who Addams really was. As I reflect on her life and her part in history, my need to push for the acknowledgement of her political and social work grows. She was not only a settlement worker, she was not only a voice for the many immigrants first coming to America, she was not only a fighter for people's rights in work and housing. We cannot sum her up easily and quickly, and if nothing else I want to open as many "valves" of her being in this paper to propel interest and understanding of how much she did and was. The great many articles and books she wrote and the fact that she won the Nobel Peace prize in 1931 show how ridiculous it is to shore her up by saying, "Jane Addams the settlement worker" or "Jane Addams the social worker." Did you know she and the other women working for peace presented President Wilson with the most comprehensive plan for peace; some of which was later appropriated into the President's famous "Fourteen Points" for peace? In Wilson's words: " 'I consider them by far the best formulation which up to the moment has been put out by any body' " (Addams, Balch, Hamilton, Intro. 11). But still she has been left out of our history. Is she taught in classes examining the first World War in depth, in major universities? Is she acknowledged as playing a significant and real role? I ask rhetorically; I ask because I want us to think about the possible gaps in our history lessons because *these gaps are the lives of women*. My unwillingness to formally define her work and her self allows room to reflect on her ingenious life, mind, and proactive politics. I look to her as a role model; I look to her hoping to pay her the due she has not received.

Jane Addams was born in 1860 in a small Illinois town. Her family was upper middle class, and her father had been involved with politics himself, being a friend of Abraham Lincoln. In a sense it was the images of these two men that held steadfast in her mind as she grew to be a political actor herself; these role-models were what she had access to, whom she could idealize in order to later have the courage to imagine and create a more ideal world. At the age of seventeen Addams went to Rockford Seminary, one of the first institutions of higher education for women (Lundblad 662). Although her life initially was sheltered from the changes in America--the industrial growth, movement into cities, the growing women's movement, the Civil War, and the estimated 35 million Europeans who immigrated to America--later her social and political activities would be compelled by how these changes took shape (Abbott 111; Frost-Knappman 159).

It was on a trip to London that Addams first conceived of Hull-House. Confronted with the poverty-stricken area of East London, Addams found a certain kinship in the settlement house Toynbee Hall; Toynbee Hall was created to bridge the gap between the rich and poor and to symbolize "hope" in an area of great poverty. Addams found a sense of meaning here in a place which brought together disparate parts of society. As Addams explained:

> I am not sure that we succeeded in our endeavors 'to make social intercourse express the growing sense of economic unity of society and to add the social function to democracy.' But Hull-House was soberly opened on the theory that the dependence of classes on each other is reciprocal; and that as the social relation is essentially a reciprocal relation, it gives form of expression that has peculiar value. (91)

She did not know it at the time, but this trip would change the direction of the rest of her life and the lives of so many.

And so it was Hull-House that provided Addams with the meaning she sought in life and the means to create a community, of sorts, of women. Hull-House was designed to be a place where immigrant women and families could get help; where they could get food, limited shelter and eventually, as it grew, political protection through social legislation. But it also provided women like Addams, those educated, wealthier women, with purpose, freedom and a creative outlet outside of marriage and children. Along these lines, Carson suggests the radical freedom of Hull-House: "In the social and intellectual ferment of the late 1880's and 1890's, the 'service ideal' became androgynous" (26). So these women were creating a space and energy that provided care, meaning, and freedom from traditional female roles. Again to reinforce this sense of "difference" for women, Elshtain sums up: "Hull-House aims explicitly to meet the needs of Addams and others like her to put their beliefs into practice, to lead lives of action. She and her comrades needed Hull-House and that is why it was created--to open up a life of humanitarian action to young women" (264). In stressing the importance of Hull-House and women's roles I mean to set-up the idea that this was the nascent step for their future political work.

As I said, Addams and her "women for peace" were directly involved with President Wilson's peace policy and also were supporters of the not-yet formed League of Nations. This was the impetus for radical action: war was not subtle; therefore, action needed to be more proactive. I find it awe-inspiring that these women who had not yet won the vote were becoming international political activists, were creating forums to express their collective beliefs and were directly creating power at a time when power was not only not offered, but kept from them. I picture this tug-o-war style; I picture this and feel tears well--if this is not a positive model for political action, I don't know what is. These women were creatively engaging politics although the realm of politics still chose not to directly engage them. Ironically enough, when Addams and her co-workers were offered attention, it was often negative, as if in hopes of dismantling their power.

She was often accused of trying to isolate the United States outside of the rest of the world's politics, and here she profoundly disputes this false claim:

> We were of course urging a policy exactly the reverse, that this country should lead the nations of the world into a wider life of coordinated political activity; that the United States should boldly recognize the fact the vital political problems of our time have become as intrinsically international in character as have the commercial and social problems so closely connected with them. (Addams 111-112)

This "urging" came from the group of women who made up the Woman's International Committee for Permanent Peace which later became The Women's International League for Peace and Freedom. The basis of their beliefs is clear here and also conjures images of how determined they were in articulating these beliefs to President Wilson:

> The Women's International League for Peace and Freedom is made up of people who believe that we are not obliged to choose between violence and passive acceptance of unjust conditions for ourselves or others; who believe, on the contrary, that courage, determination, moral power, generous indignation, active good-will, can achieve their ends without violence. We believe that experience condemns force as a self-defeating weapon although men are still so disposed to turn to it in education, in dealing with crime, in effecting or preventing social changes, and above all carrying out national policies. We believe that new methods, free from violence, must be worked out for ending abuses and for undoing wrongs, as well as for achieving positive ends. (Addams 254)

And the circle, not completed, but touched, comes to some kind of closure; in

1931 Jane Addams won the Nobel Peace Prize for her concerted and "active" efforts for peace (Frost-Knappman 8). Though this is my closure to her circle in order to go on, Addams' political profundity continued--consider this essay an opening, a beginning, not an end. It is a lesson for us to use today. Let us use Addams "political dialectic" between women and humane action as a model for today.

There are two parts to my analysis, but they are intimately linked. Women have been struggling for their rights in an organized manner since the suffrage movement, yet we still have much "path" ahead to achieve. How can we use Jane Addams' community-based action to create a larger political meaning? How can we redefine "political space" using women as models for what politics could and perhaps should be? And, finally incorporating these questions, how can we make humane-action in the political arena a serious concern? I may not be able to answer these questions now, but posing them is the first step and exploring ways to answer them the next.

In thinking about our world today, conceptualizing a true community is important. The "information" age, as it's deemed, is here; we are interconnected now in ways we have never been. If we do not begin to consider the world as a community within many communities and thus respecting those considered foreign as our "community," as Addams did, and brought forward with her International peace efforts, we will not be able to sustain our internationally-related advancements. If we view the world outside of our personal sphere in only hostile terms, we will further hostilities in general. These are my thoughts that come from trying to live with a compassionate-based belief system and from trying to understand "politics" outside of the (male-formed) "Realist-paradigm" (Gurtov 19), our traditional political frame of military build up justified to secure our national interest.

What can we learn from women? What can we learn from reinvoking Jane Addams history? There are many groups of women involved in political pursuits similar to Jane Addams. These women are also incorporating community, shared commitment, equality of treatment, humane interaction, and a sense of support into their work. Women have proven tirelessly that peaceful action is possible and beneficial to human-kind. As the women of Chile express their grief creatively over lives still missing since the rule of Pinochet, women in Kenya plant trees to preserve the environment. As Tibetan nuns remain dedicated to peace despite explicit violence towards them, women at CASA in downtown St. Petersburg, Florida provide care and advocacy for battered women's rights, and women in Peru band together to try and secure any sense of rights. How do these examples relate to Addams' work? She was a true advocate for women's roles in the public/political sphere; we must listen to her history, study her in "world politics" in order to begin to disseminate and redefine the roots of what politics can mean.

Is humane-based action a serious concern to us? We must all consider this individually and give time to thinking about how to be proactive and work with others. Humane action means upholding International Human Rights as William Felice outlines in his book Taking Suffering Seriously. It means listening to the "voices" of those referred to as the "minor" groups--the "groups" that Jane Addams strove to help and protect. These were the immigrants and women. Our world--our "community"-- is still in need of these same protections and advocates; those at the bottom layers are still trampled on, and we need to begin de-layering. We need to include in our political framework a method to secure humanity, and hence to secure peace. Jane Addams' life, ideas and peace-making can be used as a source of inspiration and as a basis for envisioning change. As Elshtain writes, "Though Jane Addams has had her day, she has yet to receive her due" (267). Thus we must acknowledge "her due" and utilize her ideas and concerns. If it is "history" to learn of President Wilson's League of Nations, then it is also "history" to learn of Addams part in it.

Jane Addams' life and politics have left me in awe, it has left me inspired in that deep way that does not cease when the book shuts. And I intend to, in my small way, to follow in her "footsteps." As Sklar concludes her article: "And it is this collective quality that women need to nurture in their peace activism today" (45). It is this "collective quality" I believe not only women need to embrace, but also "politics" needs to embrace.

Her mind shifts as a hurdle of children surround her; she smiles and tells them of her imminent travels and the necessity of the women's peace ideals. They listen and calmed by her authority, are beckoned to sit, to convene and give her the floor.

LESBIAN PERSPECTIVES ON LOVE, SEX AND RELATIONSHIPS: ADULT VS YOUTH

Angelica Victoria Hernandez

Professor Mary L. Alpaugh

Adolescent sexual behavior is characterized as experimental and non-committal. Whereas adult sexual behavior is characterized as responsible and preferably monogamous; based on societal norms. Little Frida's is a coffeehouse which allows for a broad spectrum of lesbian clientele, specifically adolescents and adults; contrary to a bar which attracts only lesbians of the legal drinking age. This particular coffeehouse offers bout a unique and comfortable environment for lesbians to gather and provided the arena from which this research was conducted. Through dialogue a comparative study of adolescents and adults was performed, on the lesbian perspective of sex and relationships.

INTRODUCTION

The study was conducted in order to identify the social, emotional, and intimate model lesbians use in order to exist in society. The subjects were clientele at a West Hollywood lesbian owned and supported coffeehouse. The perspectives presented were the perspectives of older lesbians and the perspectives of younger lesbians. Heterosexuals have been presented with a model which guides them through the process of attaining and maintaining an intimate relationship. This guidance comes from societal values present in schools, homes, and the social environment. Heterosexual adolescents are provided an arena in which they may explore sexuality by means of dating, courting, and often marrying. Marriage, the union of males with females, is accepted. The ritual of this union between the male and female is rewarded and celebrated by all aspects of society. Adolescent sexual behavior is characterized as experimental and non-committal. Whereas adult sexual behavior is characterized as responsible and preferably monogamous; based on societal norms.

This celebrated union is not found in the homosexual society. The absence of an accepted equivalent union within the homosexual community leaves lesbians and gays solo with respect to the procurement and maintenance of intimate relationships. This paper breaches this issue from perspectives on love, sex , and relationships through the experiences of adolescent and adult lesbians.

Sarah Murray defines the lesbian community as a visible group who gather together as lesbians, create organizations focused on lesbian issues or depend on lesbian identity for membership, and in the process actively represent lesbians (Murray 1994:344). Sub-culture in this context is to be defined by the crowd and the participants in the Little Frida's coffeehouse. This subculture is dominated by lesbians that either live in the community or travel to be a part of the community.

METHODS

The method of research chosen by the researcher was in form of an ethnographic study. The subjects were asked to participate in the project and informally had dialogue with the researcher. Dialogue took the form of group discussion as well as one on one conversation. Many of the subjects were informally interviewed in the same setting throughout a four week period. Other subjects were interviewed on one occasion.

Little Frida's provides a safe environment for young lesbians that do not have many choices as to where they can gather. This coffeehouse replaces the bar scene for young lesbians. Little Frida's is located in West Hollywood which is characterized as a predominately gay and lesbian area. The assumption is that there are a lot of places for lesbians to gather and socialize. This assumption proves false. There are not many gathering places for adolescent lesbians or adult lesbians to gather. These lesbians are in search of a place in which they can exist as well as a place that "belongs" to them. The word "belongs" is representative of shared ideals, styles, values and perspectives. These women are claiming a space. The comfort of a physical space being dominated by people with shared experiences provides a certain consolation. The women that go to Little Frida's all go for different reason, some go to play pool, some to do their homework and others to meet friends and "check out" the scene. Within the "checking out" of the scene it is almost impossible to go unnoticed: there are not little corners in which to hide. Many youth, since they are under age and do not attend bars, use the coffeehouse to meet other women for possible relationships, friendship etc.

The need for one's own space is crucial when trying to define one's place in society. The struggle for lesbians to be "out", openly gay is a struggle that presents itself daily. The struggles are presented at school, at home and as a member of a homophobic society. At Little Frida's there is a sense of freedom, the act of "passing" introduced by feminist writer, Cherrie Moraga is left behind. It is as if the performance is over and the facade lesbians must maintain during the day can be dropped in this comfortable setting. Yet, Little Frida's is not devoid of dramatics. The drama can be witnessed in the conversations that are overheard, the rough play that is viewed, and the slight bit of tension that permeates the room. This tension is that of "fitting in," different however, than "fitting in" society, it is "fitting in" on a micro level.

The cast of characters that frequent Little Frida's are women rebelling, consciously or sub-consciously, against heteronormativity. The perception and perceived role of a woman, defined and modeled by society, is being challenged at Little Frida's. The escape from what is "normal" is admired.

The walls at Little Frida's are decorated with portraits of the Mexican artist Frida Kahlo; she is the coffeehouse's namesake. The idea of naming a lesbian coffeehouse after Frida Kahlo, in itself, says something about the intentional luring affect it may have on strong, "different" women. Frida Kahlo's unconventional presence and person is admired and respected. A lesbian qualifies as "different" in our society by the mere stereotypes with which she is labeled. The clientele that gather at Little Frida's can easily be defined as " different" by a tolerant heterosexual witness.

Little Frida's, offering a comfortable environment, provided a forum by which informal interviews were conducted. These interviews were with both adolescent and adult lesbians. Adolescents were defined as lesbians between the ages of 17 and 24. Adult lesbians were defined between the ages of 30 and 40. For heteronormativity to present itself the adolescent lesbians would be less committed to intimate relationship.

Adult lesbians, on the other hand, would be more committal and monogamous. This assumption was not exhibited in this research.

RESULTS

The older lesbians tended to be more cynical and defeatist with respect to intimate relationships of present or past. The dialogue with the older women was difficult to document in that the conversations often turned into a comedic session. In attempt to find the ideal relationship from the adult subjects, there was hesitancy in sharing. The adolescent subjects were more prepared to answer the question, as if they had been thinking about the topic outside the interview situation.

The ideal relationship that was be grudgingly presented by the older women was different from the actual relationship they having or have had. The reality seems to stem from the fact that many lesbians are compromising their ideals for the quick passing, one night stand. This was modeled by a19 year old who was in the company of two older women. She isolated herself from the other two women during the interview. She described her experiences and said that, "she was looking for something more then sex, but finds herself having sex in exchange for a moment of caressing" (what she actually wanted in the first place.) The cycle then becomes unstoppable. What these lesbians are in search of is often misrepresented as sex it is not until after the fact that they reflect on what it was they wanted, but did not get. Experience after experience, the same feelings result; emptiness "it isn't worth it" says Beth. The hope and promise that the next person will give her what she needs is a thought held every time she her Levi's, relaces her boots and walks out the bedroom door. The story is similar to a song by Tori Amos, a well-liked female musician in the lesbian community. Her lyrics as a representation of the feelings that many women feel, when encountering a false hope. Crucify by Tori Amos.

> Every finger in the room is pointing at me, I wanna
> spit in their faces. Then I get afraid of what that
> could bring. I got a bowling ball in my stomach a
> desert in my mouth. Figures that my courage would
> choose to sell out now. I've been looking for a savior
> in these dirty streets, looking for a savior in
> these dirty sheets. I've been raising up my hands drive another
> nail in. Just what God needs another victim. Why do we crucify
> ourselves? Everyday I crucify myself. Nothing I do is good enough
> for you, crucify myself everyday and
> my heart is sick of being in chains. Got a kick for a dog
> beggin' for love.

The words to this song are potent and confessional, confession heard throughout the research. The guilt and blame that one puts on themselves for compromising themselves was recognized. When Beth told her story, she did not tell it with pride, but with a tinge of embarrassment. She had also confessed that she never viewed sex as sacred, because it had never been presented as such. She had experienced sexual abuse as a child and had a hard time differentiating between the sexual encounters she participated in and those she was forced into having, both lift her feeling worthless. "I am trying really hard to see sex as sacred, I want it to be, but I'm not perfect," Beth replied.

The discussion of promiscuity was a great focus in the research. The older lesbians did not react negatively to questions of promiscuity. The lesbians that saw no consequence to having promiscuous sex, they viewed promiscuity as normalcy among lesbians. There was no dissuasive speech that followed their bolstering about their accumulated experiences. The feelings that were mentioned were to the effect of judging the night, the determiner of whether it was a success or not was based on whether the sex was "good" or "bad".

The perspective presented by the researcher about promiscuity was that of viewing promiscuous behavior as a constant search for validation, a search for depth and connection which leaves one feeling shallow and empty. The perspective was reconfirmed by one of the subjects. Beth confesses that she feels, "empty" the morning after.

The two other women in the company of Beth were the women who had no problem with casual sex. One women asked whether the question was, "Would you go home with someone tonight if the situation arose?" That was not the question, but if she did answer that very question, what would her answer be? She replied, "Yes, yes I would." Shortly after that comment, the conversation somehow turned into a recital of how many women they had slept with, they laughed and joked. Any laughter from the researcher would have fueled the fire and their ego. The conversation was somewhat similar to the conversation a group of stereotypical teenage boys would have as they shared and exaggerated their experience.

The description of their exploits was quite graphic. The objectification of women, whether it be by a woman or a man, carried the same negative effect. Detaching emotion and feelings from a person takes away their humanness. As humans are defined by ability to feel.

With this attitude and perspective, where does a relationship fit? What is the definition of a relationship? The term relationship carries a great deal of interpretations with it. The other perspective that was presented was from the adolescent lesbian. The perspectives presented from this group in regard to the "ideal relationship" was different than that of the older lesbians. What was "ideal" how did it start and how would it be maintained? "The relationship would begin initially with an official date, an invitation to dinner a show etc.," says Nicole. Through a continual effort and frequent conversations, a friendship would blossom. The blossoming would carry the relationship to a new level of trust and intimacy. One month seemed to be the compromise as to when sexual intimacy was appropriate. "Ideally, a month is a good time, but that doesn't always happen," confessed Trina.

The competition and self-doubt for maintaining a relationship presents a struggle for the young single lesbians at Little Frida's. The societal perception of lesbian relationships is that of negativity, hopelessness and inescapable failure, these perceptions linger in the minds of the youths at Little Frida's. Although at this time the perspectives of the adolescents were optimistic, the threat of taking on the negativity from their elders is present.

The examples of positive healthy relationships do not present themselves in this environment. Where are the examples? The examples have taken themselves out of the singles scene and taken refuge in the arms of their new partners. Their time is now invested into their relationship, which also is somewhat ridiculed by other lesbians. Through envy or plain jealousy, the single lesbian might refer to the new couple as co-dependents. Healthy lesbian relationships do exist and are out in the community, but the commentary from their own peers creates a tension that many would rather avoid.

The maintenance of a relationship presents itself with great obstacles: societies non acceptance, family rejection, inter-lesbian competition, and personal identity conflicts. Lesbian relationships have been discredited by means of non-acceptance. The process of attaining a relationship has a history of secrecy, promiscuity and failure. Some jokes that circulate in the lesbian community play on the reality of lesbians moving in together the first week of meeting, and six months later experiencing "lesbian bed death." This is characterized by the physical intimacy that dies out after six months in the relationship. The relationship then being unable to sustain itself due to the fact that the relationship was fueled by sexual energy and nothing more. The reality and reoccurrence of this story is what fills the air and lingers in the minds of these lesbians at Little Frida's, the ideal relationship becomes a bit flawed.

This fear of failure is based on the self-doubt or "internalized homophobia" that lesbians have about themselves. Many lesbians feel that being a lesbian limits your future to having several monogamous relationships, each with a future of 6-12 months. What happens to the dream of "being together forever?" The short lived relationships usually result from the self-fulfilling prophecy of, "this probably won't last long" to a "friend" interfering in the relationship. The idea of a lifelong partnership does not seem real, although most hope to attain. The tools for attaining this, are not easily acquired. Societal homophobia keeps the fatalistic ideology alive. Fear and ignorance keeps the fire burning and the hearts of lesbians empty.

The confidence and overt affection that heterosexuals display is suppressed by lesbian couples, in this environment. The idea of possession and ownership does not present itself within lesbian couples at Little Frida's. This lack of possession makes it difficult at times to distinguish the friends from the couples. The public display of non-possessiveness may be a conscious rebellion against the heterosexual exhibition of "ownership." This rebellion might actually be depriving lesbians from expressing their needs and affections towards their partners. This affection can potentially normalize the presence of two women being physical and loving toward each other.

CONCLUSION

This project is still left somewhat unresolved. The perception of love, sex, and relationship has been jaded by the discussion that travel on the wire at Little Frida's. The hope for that "special" relationship is still alive, but is analyzed and dissected with a cynical tone. The older lesbians owned the cynicism. The adolescents believed that they would be able to attain a relationship, but did not necessarily have role models in that arena.

After having done the research, the researcher proposes a model for lesbians be established. The model that has been presented to heterosexuals and homosexuals is that of the patriarchal family. For lesbians, trying to mimic the lives of heterosexuals, does not work, the privileges are not the same. The proposal is to encourage lesbian visibility, women in relationships with other women must be visible and serve as role models. The new model must be created by lesbians whose relationships are unique and different from the heterosexual model provided and encouraged in society. Visibility creates an awareness which in turn can create recognition of existence.

Suzan Harrison

This paper explores how media representations of women's bodies has had an effect in the increase of anorexia nervosa cases and what the media fails to address. As a result of contradictory media messages about female body ideals, women have become increasingly prone to developing eating disorders. In the last few decades, anorexia has become an epidemic among American women. While the disease is a common topic in all forms of mass media, representations of anorexia are often misleading and glamorized, using only the most extreme cases as examples. This portrayal of the affliction is detrimental because it does not address the borderline anorexic.

Anorexia Nervosa is a disease which has become an epidemic among the American female population. According to Catherine Baker's pamphlet The Perfection Trap, 90% of those diagnosed with an eating disorder are women (6). As a result, media of all kinds have devoted much time, paper, and research to this disorder. In this paper I argue that American media images of women work to eliminate women's self-esteem, often leading them to drastic measures such as eating disorders in order to meet the cultural ideal of what a woman should look like. The main audience for these periodicals is white, middle-class teens, the portion of society that research has shown is most susceptible to this type of eating disorder. Although these media produce articles about the dangers of the disease, they also perpetuate it by running ad after ad emphasizing that American women must be thin to be successful and attractive to society. The message sent out by these types of periodicals is reinforced daily by similar images in commercials, movies, and even news programs such as Sixty Minutes, which in trying to address the issue, only wind up making a spectacle of the women who suffer from the disease.

Because it would have been impossible to survey all teen magazines for this paper, I focused on the more popular ones which included Seventeen, Sassy, Mademoiselle, Dance Magazine, and McCall's for the past ten years. In all of this material there seemed to be not only contradictory messages about women's bodies, but missing information. It is apparent that on the one hand society feels it is essential to address the issue of eating disorders so that young women will be aware not only of the disease's symptoms, but of the consequences of neglecting to nurture their developing bodies. On the other hand, though, these publications neglect to see that on the page next to the article about a girl who is/was anorectic, is a picture of Kate Moss, one of the country's top super models who is even thinner than the 1960s waif, Twiggy. And on the cover of the same magazine is a picture of a model in a midriff shirt with a flat stomach and jutting collar bones.

A perfect example of the subtle, yet conflicting messages is the Milk campaign that has been running in numerous magazines over the last year. The point of the ads is to promote the health benefits of milk by picturing celebrities with captions under their picture explaining why they drink milk. Although most of the captions are sending good messages, the Milk add with Kate Moss is questionable; her caption states: "Bones. Bones. Bones. Maybe so, but unlike 85% of girls today, there's one way I'm taking good care of mine. By getting lots of calcium... And besides, haven't you heard the waif look is out?" The combination of the visual (what appears to be a nude and thin Moss) and the textual (her claim that the waif look is out) messages is a perfect example of how the media tries to deal with the issue of eating disorders, but only succeeds in confusing the reader more by picturing the opposite of its words. Even more interesting is that Moss claims 85% of girls do not get enough calcium. While that is no doubt true, it is ironic because for a female to be considered medically anorexic, she must weigh 85% of her "normal" body weight

These messages are extremely problematic because they contradict each other, saying that women come in all shapes and sizes. However, the visual images prove that "glamorous" bone-thin women are the ones idolized by society and against whom girls measure themselves and are compared to by their peers.

Women and girls often take the message to be fit to the extreme, they feel they must meet the ideal set by one model instead of being fit for their body type and age. Thus, through what is considered typical feminine practice, dieting and exercising, anorexia begins. Ironically, this is the woman's way of trying to conform to her society while at the same time rebelling against it. In Unbearable Weight, Susan Bordo explains that in order for the patriarchy to maintain power and control over the female gender, women's bodies and women's perceptions of their bodies must be controlled (178).

Society is bombarded by advertisements about commodities. Most of these ads use images of women in scanty clothing to sell their items, giving a clear message that a woman's body is a commodity as well. As Susan Willis says in "Work(ing) Out," even exercise itself becomes a product and commodifies women's bodies because it puts women in competition with other women for the best body (710-711). The ultimate product then, becomes the woman's body. Such cultural messages create what Bordo labels as a mind/body dualism for the woman in which society gives the body priority over the mind.

With a disease like anorexia, the woman is often attempting to make her femaleness less conspicuous by decreasing body size and to punish desires which she considers bad such as hunger, sexual yearning, and elimination of waste. She persists in her denial because will power is a value traditionally associated with men and one for which women are criticized for not being able to exercise (Bordo 178). Therefore, to the anorexic, control over her body means having a type of control usually associated with men which makes her a more valuable commodity.

It is interesting that although women and men are subjected to the same societal messages about how bodies should look and how they should be seen, they are affected differently (Mahowald 242). Men apply the standards to women; women apply the guidelines to themselves. Thus, American females suffer from double jeopardy. In order to overcome this double analysis, women ironically try to conform to the male standard (i.e. looking like Barbie) by starving themselves which creates a more masculine look (of less body fat and a flatter chest). Hence, the female's education to be resistant to bodily desires and to practice self-restraint continues.

One of the most dangerous mistakes media continue to make is to sensationalize eating disorders. In every article surveyed, the patient weighed less than 100 pounds. Technically, though, a person only has to be fifteen percent below her standard body weight (for height and bone structure) to be considered anorectic. And while fifteen percent may sound minimal, it is still an extreme. For example, consider a woman who is five feet nine inches and has a medium/normal bone structure. According to the American Medical Association (AMA), she should weigh between 140-155 pounds. Eighty-five percent of 145 pounds is 123 pounds, the appropriate weight for a woman who is five feet four inches to five feet five inches. Yet, if this five foot nine inch woman were to tell her friends she weighed 123 pounds, the thought that she was anorexic would never cross their minds. After all, she is still well over 100 pounds, and everyone knows (from media information) that anorexics are so thin they barely weigh 100 pounds and must be hospitalized.

One of the most extreme examples of the sensationalized anorectic was found in a 1995 issue of Sassy. In Joanne Levine's article "Eaten Alive" the anorectic/bulimic woman, Terry Sweeny, was five feet four inches and weighed fifty-five pounds at her lowest. The extremity of Sweeny's case is typical of those found in the media. Once again, the woman who does not have a skeletal appearance would not make it into these publications. Thus, the borderline anorectic reading the article would not be able to identify her own illness because of her "healthy" appearance.

I remember as a young girl reading many articles in Seventeen and other teen magazines about girls who had or were struggling with anorexia. I distinctly remember reading an article about a girl who told of how much satisfaction she got out of watching her family eat ice cream while she lay on the couch feeling her hip bones jutting out. When I read this, I couldn't believe it; I felt exactly the same way! However, it never occurred to me that the reason I could relate so well to these girls was because I was also anorexic. That is one of the major problems with a disease like anorexia: the afflicted person has no idea that what she is doing is harmful and abnormal.

Although the media makes attempts to portray the disease accurately, they often fail, making it more 'glamorous' and only emphasizing the extremity of the problem. This is dangerous because it leaves behind the "hidden anorectic," the girl who is more than fifteen percent below her normal body weight, yet she is not in the hospital and is able to cover her obsession from even the most scrutinizing eyes. The borderline-anorectic, like the full fledged anorectic, has no idea what her body truly looks like, she is convinced she's overweight and knows she's not too thin because she still weighs over one hundred pounds. Although some of the articles make an attempt to address the mental issues and thoughts associated with the disease, they fall short because they use extreme examples of anorexic women as a way of gaining the reader's attention. For the borderline anorectic, it appears that she simply has a bad body image, not an eating disorder. However, it is the bad body image, often launched by the exact media in which the article appeared, that frequently influences the development of eating disorders. Thus, the emergence of the hidden anorectic. Because she still looks "healthy" to others, it is easy to hide her extremely warped thoughts and cover her abnormal eating habits.

I often read in pop magazines about girls who were anorectic, saw the TV spots on 60 Minutes and watched all the made for TV movies. However, they were all cases of the extreme; it never occurred to me that I was one of them mainly because I still weighed over 100 pounds. Just because I skipped meals, ate minimally at others, added my daily calories to make sure they did not exceed 500 per day meant nothing to me. I was not in the hospital nor was I close to that point. I didn't fit the anorectic "profile" outlined by the media. I was like all my other friends, simply concerned about my weight, wanting to be healthy and attractive.

Yet another feature of anorexia pop culture refuses to address is the fact that it is a mental disorder. Therefore, recovery becomes a life-long struggle. In this way, anorexia is very similar to alcoholism. For just as with alcoholism there is no cure for anorexia, only times of remission. However, unlike alcoholics who can remove themselves from situations involving alcohol, anorectics can never escape food because it is literally essential to their survival. That is why half of all recovering anorectics will relapse a least once.

As members of the drill team, we had to meet a weight requirement. Consequently we were weighed every Monday morning. Even though I was never in jeopardy of being over weight, I always feared I would be. As a result, I would close my eyes when I got on the scale and tell the coach not to tell me what my weight was unless I was over. One morning our coach asked me to wait to be weighed until all the other girls had weighed in. After I had been weighed, my coach asked me to come into her office so she could speak to me. I just knew she was going to tell me I was over weight. But instead, she told me I looked like a rail, that if I lost any more weight she would put me on probation for being too thin. I thought she was out of her mind and got very mad. I could not understand how she could say that to me. But the fact that I was in trouble for being too thin actually made me proud.

Although pop culture magazines strive to inform young women about the eating disorder from which one in two of their readers suffer, they often manage to do the exact opposite, functioning as models or handbooks about how to *be* anorexic, rather than how to *avoid* anorexia. The media repeatedly show women in the roles of giving food, preparing it for others, and feeling guilty when they occasionally allow themselves an indulgence. Thus, it is not surprising to find that in their quest to conform to these standards and rebel against them at the same time, anorectics become obsessed with food. In her article "To be or Not to be a Woman: Anorexia Nervosa, Normative Gender Roles, and Feminism," Mary Mahowald explains that, "characteristics of anorexia nervosa include a tendency to spend considerable time around food, preparing elaborate meals for others, while insuring one's own intake includes only a narrow selection of low-calorie foods" (237).

Although pop culture often uses the fact that many women are food obsessed in their anorectic profiles, they neglect to understand why this is happening. Consequently preoccupation with food often becomes a model for the anorectic and borderline anorectic reader. The fact is, according to Marian Horosko, that in the brain's effort to reject self destruction of the body, it becomes obsessed with food, demanding that the woman eat

(89). Therefore, refusing to eat is the woman's way of rebelling while continuing to cook and serve allow her to conform at the same time without compromising her rebellion.

One of the most important problems explored by feminists and psychiatrists is the fact that underlying the common issue of rebelling against cultural constructions of feminine bodies, anorexics are also struggling with gender identity issues. Therefore, it is no wonder that the disease surfaces during adolescence for one in one hundred girls. However, this is also an aspect of the disease that is never addressed by pop culture and rarely by "old school" physicians (Mahowald 240-41). So, even though many feminine traits have led to the oppression of women, they are also crucial to their success in society. That is why the anorectic has such a struggle. She realizes that she must embody the very qualities she hates to be accepted and successful in her society. Yet by taking on these characteristics, she must go against what she believes in, resulting in the mind/body dualism introduced by Bordo and the tendency to starve herself while feeding and serving others.

Although many of the stories I read about anorectic girls and women were disturbing and painted the picture of a frail being barely hanging onto life, I kept returning to the same questions: What about the hidden anorectic? How is she going to identify with this? How will she know she is headed in this direction? It is obvious that the media is trying to use shock value to pull readers in and possibly to scare people out of falling into the same trap. However, this is a defective strategy, because it creates what Bordo calls a "freak show" which allows the reader to see the sufferer's condition as outside the norm (186). This also "normalizes" the disorder and creates a numbness among society so that they too ignore the borderline anorectic.

Kim Chernin feels that the glamorization of the anorectic has created a new cultural heroine: the anorectic girl (47). This heroine is seen in ad after ad, on TV programs and in magazine articles, there is no place to hide from her image. As a result, she has become the societal norm instead of the exception. And with the current emphasis on dieting and exercise, society has provided the perfect breeding ground for this new "heroine." Sadly, her glamorization gives women the idea that being anorexic is about being an exhibitionist; most American girls and women know they will be respected for the ability too display control over their bodies (Chernin 46).

The sources surveyed were very quick to designate *the* anorectic model, but gave no heed to the fact that although there are certain symptoms and characteristics that seem to be found in the majority of anorexia cases, there are also many other sufferers who do not fit the stereotypical profile. By giving only one or two symptoms to look for, borderline girls and women are in danger of being overlooked. Because one-half of all anorectics relapse and ten percent will die from the disease, it is essential that the American public is correctly informed about the disorder.

In "Eating Disorders and Sex," the author explains the physical health risks of anorexia. Yet, there is no mention of the lasting emotional effects, and these are often the most difficult to overcome because there is no escaping the brain. For those afflicted with an eating disorder, food evokes all sorts of feelings. Every meal time is a major ordeal. The main feeling I associate with food is guilt. Even though I am in "recovery," issues of food are something that can easily become consuming and destructive. Living with an eating disorder and the after effects is a constant battle. Even when I feel I've conquered the problem, it comes sneaking back; what do you do? Do you give in? You want to, but you know so much more this time, you know both sides of the coin, but this knowledge only adds to your guilt. Guilt, that's the best way to describe anorexia to another person. Guilt about eating, guilt about not eating, guilt about hiding the fact that you're not eating, guilt about not hiding it.

In Where the Girls Are, Susan Douglas makes some insightful observations about the effects of media, saying that "In a variety of ways the mass media helped make us the cultural schizophrenics we are today, women who rebel against yet submit to prevailing images about what a desirable, worthwhile woman should be" (8). Because the media has the ability to influence us on conscious and subconscious levels, whether we like to admit it or not, it is imperative that the media begin taking responsibility. That means magazine editors and advertising executives need to pay closer attention to the detrimental effects their ads and articles may have on their readers. Publications aimed at women and teenagers need to be especially critical. These publication should not run articles about the epidemic of eating disorders and how dangerous they are not only to the physical well being of women but to their position in society and then an ad of Kate Moss on the next page.

As consumers, we also have a responsibility. Instead of buying into the images we hate, we must become resistant to them. This does not mean that we rebel by starving ourselves, but that we take action. Protest against offensive and potentially harmful ads, write letters to editors and executive producers. But most of all, we must not encourage the abnormal food attitudes and behaviors among our friends, female and male.

Testing the Effects of Sample Composition and Context On Radiocarbon Dating from Mammoth Cave, Kentucky

Sarah McCloskey

Department of Anthropology
Kent State University
Kent, Ohio 44242

Faculty Advisor:

Dr. Kenneth B. Tankersley

Mammoth Cave, located in southwestern Kentucky, is the longest karstic system in the world. More than 100 years of archaeological research demonstrates that Early Woodland peoples explored almost 20 km of the cave. A suite of 42 radiocarbon dates suggest that this activity took place sometime between 4,000 and 2,000 years ago. Recent studies have shown that both sample composition and archaeological context are crucial to accurate interpretations of radiocarbon assays. Radiocarbon dates from Mammoth Cave have been obtained on a variety of materials including charcoal, human feces, human tissue, and uncarbonized plant remains from contexts such as hearths, mineral mines, and the surfaces of remote chambers. A statistical evaluation of composition and context shows that the prehistoric activity in Mammoth Cave occurred in less time than previously thought.

BACKGROUND

Caves have long fascinated peoples around the world. They are passages into the depths of the earth, as well as bountiful sources of minerals and lithic materials for tool manufacture. Caves were also natural shelters available to people and exhibit a variety of traces of human activity. Because of their stable atmosphere (generally constant mild temperature and humidity), millennia-old materials are often preserved, and look as if they were dropped yesterday. This scenario holds true for portions of the Mammoth Cave System of southwestern Kentucky.

Salts and Mammoth (both a part of the Mammoth Cave System) were dissolved from limestone characteristic of the Mississippian period, and together they constitute the longest karstic system in the world. The two modern entrances lie 4.8 km apart, but the caves themselves are connected subterrainally. Both caves are usually divided into "upper" and "lower" levels. The upper levels were created during a time span ranging from approximately 1 to 2 million years ago (Palmer, 1981). Although shaped by water, the upper levels have remained dry since the lower levels were formed (100,000 to 10,000 years ago), allowing for the excellent preservation of materials.

HISTORY

Archaeological investigations have been conducted in the Mammoth Cave System for more than 100 years. Through all these investigations, researchers offer one recurring temporal theme - that people explored the system during a period from 2,000 to 4,000 years ago, a span largely coincident with the Late Archaic (ca. 5500-3000 b.p.) and Early Woodland (ca. 3000-2000 b.p.). However, my evaluation of radiocarbon sample composition and context shows that prehistoric activity occurred in a far shorter time span - in fact, less than a millennium.

Mammoth and Salts Caves have been under scrutiny from cave archaeologists the world over. Due to excellent preservation, there is an abundance of material to be dated and investigated, leading to many publications on patterns of exploration and exploitation of the cave and its mineral resources (e.g. Benington, Melton and Watson, 1962; Carstens, 1980; Gardner, 1987; Munson et al., 1989; Smith, 1993; Schwartz, 1960; Tankersley et al., 1994; Watson ed., 1974; Watson et al., 1969; Watson and Yarnell, 1966; Young, 1910). These investigations resulted in the accumulation of a large sample of radiocarbon assays. When viewed from oldest to youngest, the radiocarbon age determinations suggest that the deepest areas of the caves were used first. However, the issues of radiocarbon sample composition and context have never been systematically addressed. In this paper, I will formally evaluate the sample of dates, based on these two criteria and test for relationships between (1) distance from the entrance and (2) depth below the surface.

EVALUATION

Two issues must be addressed in the consideration of every radiocarbon sample: context and composition (Kuzmin and Tankersley, 1996). Good context occurs in three situations. A sample may be taken from the same stratigraphic level as cultural artifacts (stratigraphic association) from the immediate proximity of the target materials (direct association) or through the direct dating of an artifact or human feces. Poor contextual association, on the other hand, can be identified with samples having no primary relations (i.e. found on the surface with a mix of other materials) or a sample of questionable origin.

While some (e.g. Taylor, 1987) advocate the dating of wood charcoal samples, the best compositional substance for ^{14}C determinations is short-lived plant remains. In dating short-lived plants, the heartwood problem associated with wood charcoal is avoided and it is safe to assume that the organic carbon was formed in a specific year. At Mammoth Cave, "bad" compositional samples would be those coming from long-lived plants (such as trees) or those possibly contaminated by microbial activity (skin tissue) (Watson & Yarnell, 1988).

A total of 48 dates have been obtained from the Mammoth Cave system. I separated these dates into 6 groups: A) wood charcoal; B) short-lived plants in the form of artifacts; C) human paleofeces; D) human skin tissue; E) uncarbonized ecofacts; and F) soot.

Group A (n=13) was created because the age of wood charcoal is not a direct indicator of human activity, nor does it provide consistent data. Some of the charcoal could have washed in from outside the cave and it has no cultural context. These samples cannot be accepted as accurate scientific data, because they have bad context and composition.

The samples of Group B (n=14) were placed in a separate category because they are short-lived plants (good composition) and are more precise and reliable in dating than wood charcoal. They are all artifacts, ranging from woven fabric, gourd bowl, slipper, cedar climbing pole, digging stick, to charcoal from cane torches. Thus Group B samples are directly linked to a cultural activity and have good context.

Group C (n=12) is the direct result of human activity and is consequently contextually sound. There appears to be no major compositional anomalies inherent in the feces that might give biased dates. Group D (n=3) has very good context as well, but lacks compositional quality. Due to microbial activity on the decaying flesh, carbon is still produced even after the individual's death, potentially resulting in skewed dates. This phenomenon is supported by Watson & Yarnell (1988), who have experienced "young" dates as a result of microorganism activity. Group F (n=5) is simply wood, bark and twigs found in various areas of the cave. These samples have mediocre compositional value and no substantial cultural context, due to uncertainty of their origins and mode of transport into the cave.

Finally, there is Group G (n=1) which contains one sample - "soot". This specimen was placed in a category alone because of its dubious nature. Scraped from the cave wall in Upper Salts, this sample holds little scientific worth. It is from an area which has long been open to the public, and could be a result of any of the forms of illumination used - kerosene lamps, oil lamps, torches, etc. Therefore in this study, "soot" has been eliminated as useful data. Based on my evaluation of the sample composition and contexts, it appears that only two of my original six groups remain as suitable data for analysis: Group B - short-lived plants, and Group C - paleofeces.

After my assessment, slightly more than half of the original radiocarbon dates are included in the category of good composition and context. Of these remaining 26 dates, all fall within a range of 2190 b.p. to 2980 b.p., 890 years of prehistory. When shown in comparison with the time span of all 48 dates, the difference is clear. Taken at face value, all 48 dates reveal a range of 1920 b.p. to 4120 b.p., a 2,200 year time span. This age range is inclusive of all the radiocarbon samples taken thus far, regardless of sample composition or context. The range is more than two times the period resulting after my evaluations, suggestive that elimination of "bad" radiocarbon dates offers a more accurate view of cave use, as opposed to the earlier hypotheses.

In a second effort to increase the usefullness of certain ^{14}C dates, I use the concept of "chronometric hygiene" (Spriggs, 1989, Taylor et al., 1996). According to Taylor et al. (1996), any ^{14}C determination with a $\sigma > 80$ should be taken out of the data group used for investigation. This test serves to eliminate dates which potentially show laboratory error. Nine dates were removed as a result of this test. The final seventeen dates that meet all the criteria (good composition, good context, and small sigma) once again range from 2190 b.p. to 2980 b.p.

Finally, I offer a hypothetical model of the pattern of exploration by Early Woodland peoples in the Mammoth Cave System. For this model, I consider two groups of data: all radiocarbon dates versus 17 dates shown to have good composition, good context and a small sigma. Initially, the findspot of each sample was located, and its distance in meters from the closest natural entrance was determined. Each sample was also assigned a number (1, 2, or 3) representing the subsequent levels of the cave (1 being the youngest, 3 the oldest).

I calculated multivariate regression statistics for all the radiocarbon dates (n=48) and compared them to the group of 17 dates shown to have good context, good composition and small sigmas. The dependent variable was the radiocarbon dates and the independent variables were distance from the entrance and depth below the surface. The resulting R^2 values are comparable: 0.854 (all dates) and 0.933 (good dates). Each independent variable was then subjected to a P two-tailed test. For depth below the surface, both sets of data were statistically significant. Compare all dates (P= 0.0001) to good dates only (P= 0.001). However, the P scores were drastically different for the dependent variable of distance from the entrance. All radiocarbon dates and their distance from an entrance is not statistically significant (P= 0.458). In a test of the good dates, a statistically significant number was calculated: P=0.019. This test is evidence that the question of distance from a cave entrance, leading to a temporal layout of exploration, was greatly affected by the use of radiocarbon dates of less than ideal composition and contextual content in the data group.

CONCLUSION

In conclusion, my investigation of the Mammoth and Salts Cave radiocarbon dates show that prior chronometric interpretations may have been biased. Through the use of multivariate statistics, one can obtain a more clear and accurate temporal placement of human activity at the site. I have demonstrated that prehistoric activity within the Mammoth Cave System actually took place in less than a millennium. Previous investigations postulated that exploration and mineral exploitation occurred in more than twice that amount of time, on the basis of radiocarbon samples of questionable composition and context. This study highlights the drastic effects "bad" radiocarbon dates can have on the chronometric analysis of a site.

Importantly, these tests can be applied to other sites anywhere in the world that have been radiocarbon dated. As shown here, they will prove useful in removing erroneous data, allowing for a more concise temporal view of the site, and will aide in drawing correct cultural associations between sites and the activities that created them.

Three-Dimensional Mapping of the Bluff Greathouse Archaeological Site

Natasha Psenicka

Department of Anthropology
University of Denver
2130 S. Race St.
Denver, CO 80208-2406

Faculty Advisor:

Dr. Lawrence B. Conyers

About AD 1000, a moderate size "greathouse" was constructed by the Chaco people near the present town of Bluff in southeastern Utah. A preliminary excavation of the site October of 1995 carried out by its principal investigators, Steve Lekson and Cathy Cameron of University of Colorado/Boulder, revealed a pueblo and two associated kivas. In spring 1996, I produced a three-dimensional map of the Bluff Greathouse archaeological site using detailed digital topographic maps and Surfer, a state of the art landscape reconstruction software program. I then manipulated the data to produce color contour and three-dimensional maps and completed an archaeological interpretation of the results. Through this research project, I identified subtle topographic features such as a ceremonial moat and midden area that were previously obscure. My conclusions were used by archaeological teams in the continued excavations of the site in the summer of 1996.

BACKGROUND

Beginning about AD 800, agricultural people moved into southern Utah along the San Juan River near the present town of Bluff (Figure 1). The first settlers lived in pithouses and farmed the nearby river valley soils. About AD 1000, the area came under the influence of a dominant Chaco culture, the center of which was to the southeast in New Mexico. A moderate size Chaco "Greathouse" was constructed on the northern terminus of a road leading to Chaco, beginning on the northern bank of the San Juan River.

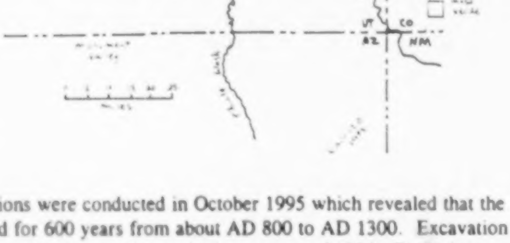

Figure 1: San Juan Region

Preliminary excavations were conducted in October 1995 which revealed that the site may have been occupied for 600 years from about AD 800 to AD 1300. Excavation of the greathouse and its surrounding features began in the summer of 1996. Preliminary analysis indicated that the site is part of the Chaco complex and is a likely Chacoan outlier. The greathouse appears to be a 12 to 15 room two-story pueblo with two associated kivas. The principal investigators of the site are Steve Lekson and Cathy Cameron from the University of Colorado.

Fifty meters southwest of the greathouse complex, is a probable great kiva, a major ceremonial feature lying at the terminus of the Chaco road system. Only a few great kivas have been excavated in the American Southwest. Portions of a ceremonial wall or embankment are visible on the surface surrounding the dominant architecture of the site.

Archaeological studies have been conducted in southeastern Utah since the 1910s, producing numerous information about greathouse sites. However, the Bluff area has not been studied until very recently. Chaco Canyon dominated the Pueblo Southwest during the Pueblo II period (AD 900-1150).

Massively built, multi-storied, greathouses along with great kivas, and small habitation clusters are visible across the Pueblo Southwest and are related to the "Chacoan community" pattern (Lekson 1991). The Bluff site fulfills the requirements of a Chacoan settlement pattern defined by the presence of a greathouse, a great kiva, and a prehistoric road through the center of the site (Cameron, Davis, and Lekson 1996). Other sites in the Northern San Juan Region also fit the requirements of the Chacoan settlement pattern (Adler and Varien 1993:90). A relationship between the Bluff greathouse and Chaco Canyon could also appear through economics, through trade, and stylistic architectural similarities.

Greathouses may have been reoccupied during the Pueblo III period (AD 1150-1250) after Chaco Canyon collapsed. Pueblo III reoccupation patterns are common in southwestern Colorado, but southeastern Utah has yet to establish such an occupation history of greathouses (Lekson and Cameron 1996).

A problematic relationship exists between Chaco Canyon and the Northern San Juan Region. Archaeologists share varying opinions about the relationship. Judd (1954) and Vivian (1990) suggest people from the Northern San Juan Region immigrated into Chaco Canyon at an early date. Vivian and Mathews (1965) favor a late immigration. Other archaeologists note a shift of interaction rather than a migration with trade from the Northern San Juan Region becoming more important towards the end of the Chacoan construction phase. Judge (1989) and Toll, Windes, and McKenna (1980) suggest the "center of gravity" shifts from Chaco Canyon to the San Juan Region.

Popular theories about Bluff include a Chacoan community established by people from Chaco trying to gain an economic advantage in the far region, or the Bluff site may have been established by local people copying the ways of Chaco Canyon in an attempt to gain power. Bluff is not a unique site, but part of a regional pattern where sites similar to the Bluff greathouse have been found in over 100 locations in the Southwest. High quality data is available at Bluff and combining it with available data from other sites will expand the body of knowledge of the Chacoan regional pattern and the relationship between Chaco Canyon and the Northern San Juan Region.

DIGITAL PHOTO INTERPRETATION

In the summer of 1995, an aerial photographic survey was conducted which produced a detailed (500m x 500m) digital photogrammetric topographic map of the site with resolution to 10 centimeters. These data were downloaded and used as the data base for this project. This project's focus was to customize the site area and enhance the site's features in order to reveal obscure or invisible features.. The computerized enhancement of the photogrammetric maps produced images that were able to be evaluated in theoretical frameworks.

COMPUTER METHODS

Digital data from the aerial photogrammetric map was entered into Surfer, a landscape reconstruction, contour, and three-dimensional surface mapping software package, in order to produce a three-dimensional topographic map of the site. The more pronounced features associated with the anthropogenic modifications then became immediately visible. Additional interpretation was then made to identify features not previously discovered during cursory surface surveys.

A topographic photogrammetric map was produced from aerial photography (Figure 2), which was the original base map. XYZ data points from the topographic map were digitized and exported as ASCII data files. Dr. Larry Conyers from the University of Denver, modified the XYZ data compiled from aerial photographs by taking out the coordinates of current land features including roads, transmission lines, and boundary markers. The modified data set consisted of 10,630 XYZ data points in ASCII format usable by the Surfer software.

The digitized data was imported into a worksheet where X = east, Y = north, and Z = elevation of ± 100 meters. The worksheet data was arranged in a row and column format, and a data file was then created from the worksheet. All further contouring and mapping using Surfer was generated from this data file.

Figure 2: Digitized Topographic Map

A grid file was then created from the XYZ data file. Grid density, gridding methods, and smoothing interpolators were modified to produce minimum curvature. Once this was accomplished, a digitized topographic contour map was created (Figure 2). Areas not directly associated with the archaeological excavation were included in the map.

A subset grid file used in all subsequent mapping was created by setting new map limits which eliminated the non-essential areas, concentrating on the area around the archaeological site. Rescaling expanded the size of the subset grid, and a new contour map showing the excavation area was generated (Figure 3).

Step 2 consisted of modification of the contour map. Contour levels were adjusted to .5 including an addition of new levels. Contour line labels were eliminated, contour line attributes were set to be consistent in color, style, and width, and additional smoothing of the curvature customized the map. Custom color fill between the contours was created to show differences in elevation, and a color scale was added to the map.

Step 3 was to produce a surface plot of the archaeological boundaries. Surface plots are three-dimensional representations of grid files. Modification of the surface plot used specific options of elevation angle of view. Hidden lines were removed to prevent a transparent appearance on the surface. The surface plot scale was exaggerated to show the land features and elevation more clearly (Figure 4).

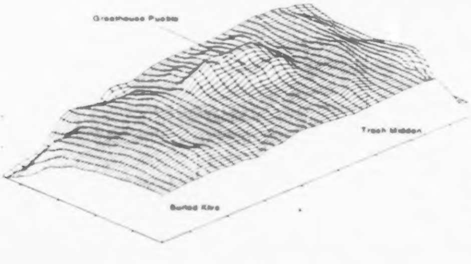

Figure 4: 3-Dimensional Digitized Surface Plot

BEST COPY AVAILABLE

Step 4 created an overlay map using both the surface plot and the color filled contour map from above. Once this map was generated, the view orientation was manipulated by modifying the tilt, rotation, and perspective of the map. Rotation and perspective were changed to better illustrate important archaeological features.

In Step 5, both an image map and a shaded relief map were attempted. Shaded relief maps use different gray scales to indicate slope and light source position. However, high quality results were not obtained.

RESULTS OF DIGITAL MAPPING

By viewing the color contour map, archaeological surface features became visible. The pueblo, or greathouse, as well as the great kiva were both easily identified. A possible trash midden is also apparent to the southeast of the pueblo. Two small features behind the pueblo became discernible. They are the same elevation as the great kiva and although not round, show similar characteristics in size and shape and may be other unidentified kivas. An elevation contour of 99.5 completely surrounds the pueblo and trash midden, jutting out to the west encircling approximately one half of the great kiva. Because this topographic feature is so oddly shaped, further field investigation is suggested to determine if this could be part of the earthen berm discovered during reconnaissance. The prehistoric road segments do not appear on the contour map perhaps because it is either very subtle or buried by alluvium.

INTERPRETATION

Important spatial information was gained through the three-dimensional mapping of the Bluff Greathouse Site. Many otherwise obscure surface features became more visible after removing existing land features. A subset grid was created which concentrated on the area of interest--the greathouse, kiva, and midden. Contour intervals were adjusted to 10 cm in order to show the elevations and features more precisely. Adding color to the elevation levels allowed enhanced viewing and comparing of features with other elevations and possible features.

The size of the archaeological features was revealed in three-dimensional maps in proportion to other features. The trash midden is a prominent area in the color contour map and was not previously seen as a distinctive area in the original aerial photo generated topographic map. A possible ceremonial moat surrounding most of the great kiva was also brought to attention by this mapping project. It was recommended that a test excavation be used to further explore the moat and midden regions. Circular features are visible north of the trash midden. They are the same elevation as the great kiva. This area should be tested in the future.

This survey led to the identification of the trash midden and great kiva. Excavations were conducted during the summer of 1996 by the University of Colorado Archaeological Field School. Excavation units were conducted in the greathouse, earthen berm, and great kiva area. A large collection of artifacts were collected.

The earthen berm did indeed turn out to be a trash midden. Trash deposits were clearly represented by found items of charcoal, bone, ceramics, lithics, eggshell, and other related objects (Cameron and Lekson 1996). Two test units were conducted in the kiva area. Puzzling wall features were found suggesting two stages of construction. Further excavation is planned in the kiva next summer.

FUTURE WORK

Currently, computer technology is just beginning to be used in the field of archaeology, and most of the work being done is conducted by non-archaeological personnel. However, in recent years, several projects have been undertaken using computer graphic techniques to visualize complex data in archaeological investigations. This study adds to the growing body of knowledge. The impact of the research has provided the archaeological community at the University of Denver with computer technology and expertise that may have otherwise been under utilized.

New software programs are beginning to revolutionize the way archaeology is being structured, and the improved technology will enable cultural evolutionary theory to advance. Enhanced aerial photographic images and new software programs are enabling test excavations and archaeological field surveys to be customized, to be more efficient, more descriptive, and allow more productive information to be gathered (Larson and Ambos 1997:10).

Software programs are equipped with filters and enhancers that reveal exceptional detail of features that might otherwise be obscure or invisible on raw data. Subtle changes as well as exceptional detail in archaeological features can be obtained with filtering and smoothing capabilities. The new technology allows for the study area to be tested and evaluated in a specific theoretical framework, and can also be used in development planning without extensive excavation, thus preserving the site (Larson and Ambos 1997:12,30,39).

ACKNOWLEDGMENTS

This research project was supported by an undergraduate research grant from the University of Denver and by Golden Software, Inc. I want to especially thank Dr. Larry Conyers for his ongoing help with the project, and for his knowledge, enthusiasm, patience, and overall support.

Scholarly Sightseeing in Rome, Ravenna, and North Africa: The Differences in Early Christian Centrally Planned Vaulted Structures

Benjamin D. deLee

Hampden-Sydney, VA 23943

Faculty Advisor:

Dr. Christine Colley

Rome and Ravenna have always been in the center of focus for art historians. Rome has been a center of architectural development and innovation from its foundations to the modern day. Ravenna is a city almost frozen in time, offering some of the best preserved and grandest examples of fifth and sixth century Christian architecture. Indeed, these two cities, along with Constantinople, have always been at the focus of Early Christian and Byzantine architecture. For variations on the urban Early Christian architecture, art historians turned to the provinces. Far-flung places such as Syria, Asia Minor, Egypt, Illyria, and Gaul were found to have their own variations of Early Christian Architecture. One region, North Africa, was largely ignored in this perusal of the provinces. Roman North Africa's Christian architecture is worthy of study. While it would take a lifetime of work to rectify the scholarly negligence done to North African Christian architecture, some progress can be made. North African Christian architecture merits scholarly attention even when it is compared with the architecture of Rome and Ravenna. Focusing on centrally planned vaulted structures makes the differences between North African Early Christian architecture and Italian Early Christian architecture especially clear. Centrally planned vaulted structures are associated with two of Christianity's most sacred rites, baptisms and funerals; therefore, any differences between buildings used for these purposes is significant for art history as well as Church history.

In North Africa, a major part of the Roman Empire, the basic Christian centrally planned vaulted structure is either lacking or altered beyond recognition. In Italy and much of the Mediterranean after the reign of Constantine, baptisteries were virtually always round or polygonal, but in North Africa, very often, the centrally planned structure is not even implied; instead, vaulted squares, single-naved structures, and even concave squares are used. North African and Roman and Ravennate architectures were derived from many of the same sources, but North Africa makes a greater break with its Roman classical heritage and produces a more innovative Early Christian architecture. The different shapes—whether square, Greek-cross, rectangular, or concave-square—in North African ecclesiastical architecture call for even more attention when they compared with the nearby centers of Rome and Ravenna because the variations reflect a very strong native architectural tradition and differing liturgical practices.

Like Rome and Ravenna, North Africa had a rich classical architectural heritage from which it could derive new forms of architecture for the Christian church.[1] Yet, the basic type for a Christian centrally planned vaulted structure is virtually non-existent in North Africa; North Africa makes a cleaner break with its classical past and produces a truly original version of Early Christian architecture. While art historians such as Davies, in a single footnote, may declare North African Christian architecture to be unoriginal, North African Christian architecture employs many original shapes and plans (Krautheimer 167, Davies 102). While there are occasional examples of octagonal and hexagonal baptisteries— both are common elsewhere in the Mediterranean, especially in Italy—the Greek Cross[2] and square are much more common (Davies 102). Martyria of the central type, of which the Anastasis of Jerusalem was the greatest example, are non-existent in North Africa (Krautheimer 189).[3] There are even examples of baptisteries that have fonts that have several receptacles where more than one candidate could receive baptism simultaneously (Davies 102).[4] The baptistery at Bir Ftouha is the only Early Christian concave-square walled structure known. These shapes and forms are not present in Syria or Egypt, the supposed sources for North African Christian architecture.

---

[1] There is still a lack of sources for North African ecclesiastical architecture. Presented here is a small sliver of the large amount of truly interesting and unique Early Christian architecture that exists in North Africa still today, if only in the most damaged remains.

[2] The Greek Cross will not be discussed here. It is a centrally planned structure, and its use as a baptistery is much more frequent in North Africa than elsewhere. The use of the Greek Cross as a baptistery lends further credence to the idea that North African architecture is unique in its uses, but the form of the Greek Cross is not unique. The Greek Cross is much more extensively used in Italy and particularly Constantinople, but in those regions it is more often used as a church rather than a baptistery.

[3] There may be one exception to this rule. A round, possibly vaulted structure has been found in Carthage, but its function is unknown. This example serves more than anything else to illustrate the general lack of attention North African Christian architecture has gotten; many of North Africa's Christian sights have yet to be satisfactorily studied (Krautheimer 187-188, 482-483).

Not only are the forms but also the arrangement and shapes of the ecclesiastical buildings of North Africa are unique. The attachment of baptisteries and martyria to the apse of the main longitudinal buildings is an arrangement peculiar to North Africa, and it is a startling contrast to the practice of Italy. In Italy the baptistery is directly in front of or at the side of the basilica. The baptistery is never attached to the rectangular basilica in Italy, although it is sometimes adjoined to the atrium (Lowrie 182). The Italian arrangement even has precedence in Classical Roman schemes of arrangement (Kostof 55-56). In contrast, baptisteries in North Africa are usually attached to the main basilica behind the apse (Davies 133).[5] Yet, North Africa seems to break with its classical past, and it produces new forms and arrangements for baptisteries.

The baptistery at the so-called cathedral of Carthage is a simple square, attached to the left of the entrance of the Church. On the rear wall of the baptistery is an attached chapel, which is an exact replica of the larger basilica, apse included. Directly behind the apse is what appears to be a large villa, traditionally called the bishop's palace. Immediately to the right of the basilica, across what would have been a street there is another Christian basilica. The shape of the baptistery differs significantly from any of the baptisteries in Italy.[6] While the square may be an earlier form for baptisteries in Italy, it is notable that the earlier form persists in North Africa, although the attached apsed chapel makes the baptistery more than a mere square. Its attachment is an even further deviation from any of the baptisteries of Italy. The simple square may be a conservative form for a baptistery, but the conservative form is modified and altered to fit the liturgical needs and regional variance of North Africa.[7]

However, the most unusual building in North African Christian architecture must be the baptistery at Bir Ftouha.[8] The baptistery at Bir Ftouha (mid-fifth century A.D. or later) is a building completely different from any known building in the Roman world.[9] It is a concave square, and it was most likely attached to the apse of a rectangular basilica.[10] The large number of vaulting tubes suggest the the structure was vaulted. (Stevens 33). There are also column foundations and architrave blocks, which are rare for North Africa (Krautheimer 191).[11] There is also evidence, such as packed surfaces for floors and wall foundations, for structures outside of the baptistery.[12] The baptistery may have been part of a much larger ecclesiastical complex. The baptistery at Bir Ftouha may have been a martyrium that was converted into a baptistery; a reliquary box and several tombs were found. In the West, martyria were usually not converted into baptisteries, although the practice occurred not infrequently in North Africa (Kostof 55-56). The placement of the baptistery at Bir Ftouha—onto the apse of a greater, rectangular basilica—is most unusual for Early Christian architecture. Yet, this placement is not uncommon for Early Christian architecture in North Africa; the baptistery of the church at Leptis Minor has the same placement in relation to its basilica. Still, the shape of the baptistery at Bir Ftouha is very unusual for any area of the Roman world.

The reasons for North African Early Christian architecture's variance from that of the rest of the Early Christian Roman world are unknown. No conclusive study has been done. While conditions and circumstances, such as stone types and the lack of wood may have influenced certain aspects of North African architecture, ultimately the differences must be attributed to

---

[4] Davies apparently knew of some of the innovations of North African Christian architecture, but he still refused to give North African Christian architecture the attention or credit it deserves.

[5] Sometimes the baptistery is attached directly to the apse; sometimes there is a space, not necessarily an ambulatory, between the apse and baptistery.

[6] The early baptisteries in Italy are squares. Generally, the square is considered to be the primitive form for baptisteries, but its persistence in North African Early Christian architecture, even when it is obvious that the technical skill for domed octagons was available in North Africa, is another aspect of the uniqueness of North African Early Christian architecture. This conservatism is hard to explain; perhaps it reflects the conservative nature of the North African Church. Vaulting tubes and many of the structures described below, especially the baptistery at Bir Ftouha, prove that North Africans certainly had the technical skill to build any form of baptistery that they liked.

[7] It has been suggested that the attached chapel may have played a part in the baptism ritual of the North African Church. Still, too little is known about the liturgical practices of North Africa to make any definite conclusions.

[8] Bir Ftouha is an archaeological dig in progress, so much information concerning the building is incomplete.

[9] The baptistery/martyrium at Bir Ftouha has been described as "Hadrianic." The shape does have precedence at Hadrian's Villa at Tivoli. How such architectural ideas and methods could have been transferred from Italy to North Africa over such a period of time is impossible to say. The most plausible explanation is that the idea for a concave square was not transferred, but rather, the idea was developed independently in Christian North Africa. Why the baptistery at Bir Ftouha is shaped as it is another question all together.

[10] The baptistery is most probably attached to a basilica, but the existence of a basilica relies on earlier, scantly published excavations. I is yet to be proved conclusively that the baptistery at Bir Ftouha is attached to a basilica.

[11] North African architects overwhelmingly preferred the archivolt to the achitrave.

[12] The actual foundations have been robbed. Bir Ftouha is a perfect illustration of the poor state of most of the Early Christian ruins in Carthage; it is sobering to know that Bir Ftouha is actually well preserved for Early Christian Carthage remains.

BEST COPY AVAILABLE

something greater. There are not obvious architectural centers. nor do the political and religious controversies like the frequent border raids and Donatist controversy. and other changes that took place in North Africa seem to have had a strong influence upon the Christian architecture of the region (Krautheimer 187). The most probable explanation is that North Africa had significantly different liturgical practices (Krautheimer 482-483). The North African Church had many peculiar and independent features like liturgical practices. the Donatist schism. and significant martyrs' cults. Still, as mentioned above. the degree of influence such controversies had upon the architecture is questionable. If Kostof is right in attributing great theological significance and symbolism to the placement and shape of Italian baptisteries (56). then there must be some reason for the shape and placement of North African baptisteries.

The true uniqueness of North African Early Christian architecture is more fully understood when it is compared with the nearby centers of Rome and Ravenna. Rome was the capitol of the Empire. Rome, unlike North Africa. had always been a political and architectural center. From the earliest days of Christianity. Rome was an important center in the Christian church. When the Roman Emperor Constantine promulgated his Edict of Milan in 311 A.D. the new era of toleration allowed the Christian church to begin building grand. public structures. Christian architecture came into an even greater blossoming after Constantine had his vision at the Battle of Milvan bridge (A.D. 312). While the nature and extent of Constantine's conversion may be debatable. it is clear that after A.D. 312 and the consolidation of his power. he began to favor and promote the Christian religion (Boak 414-415. 513). The ascension of Constantine to the throne and his patronage of the Christian Church had a direct influence on Christian architecture.

To see the earlier Roman roots of the Early Christian architecture of Rome. one must first examine the Pantheon (A.D. 125-128). the quintessential centrally planned vaulted structure of Classical Rome. From the zenith of Roman centrally planned vaulted structures. the Pantheon. early Christian centrally planned buildings are derived. including the buildings examined here. The Pantheon would have been the perfect model for Early Christian architects. The Pantheon certainly is monumental. Its memorial symbolism would make its shape perfect as a martyrium or as a baptistery in which to celebrate one of the Church's most monumental rites. There is a connection between the use of the Pantheon and the uses of the Christian buildings derived from it. For example. note the connection between the uses of the Pantheon and Christian buildings like Santa Costanza. The Pantheon is a memorial structure and so is Santa Costanza. Santa Costanza is a mausoleum for Constantine's sister; her tomb is round. just as the tombs of many of the emperors were round. While all elements of the Pantheon are not present in Early Christian edifices. the pattern of evolution from the Pantheon to a structure like Santa Costanza is pretty clear. The Pantheon is a round building with a great dome. Its walls are immensely thick—six meters. In the interior the walls are pierced by seven great niches (Macadam 120). Interior niches are used over and over again in many similar structures (Davies 59).

Of course. the centrally planned vaulted structure goes through some phases of development before it is adopted by Christian architects for Christian purposes. The nymphaeum in the Licinian Gardens. called the temple of Minerva Medica. represents the next stage after the Pantheon. In The Temple of Minerva Medica (A.D. 263-268) ten niches pierce through the inner wall and become arches—or a colonnade in other structures—that opens into the surrounding ambulatory (Davies 61). The Temple of Minerva Medica is the bridge between the Pantheon and Early Christian structures like the Lateran Baptistery and San Vitale because rather than circular walls. the Temple of Minerva Medica has ten-sided walls. These are easier to construct than circular walls. but the near-circular shape of the walls makes surmounting the walls with a dome easier than with a hexagon or square (Macadam 219). The Temple of Minerva Medica was a model for many classical buildings. but its basic plan. a polygon surmounted by a dome. became a model for many Christian buildings.

This form of an inner wall pierced with arches became a common feature of Roman construction. clearly derived from the Pantheon where the niches are embedded in the thick walls (Davies 59). As the dome and the walls become thinner and lighter. the niches eventually became arches. as in the Temple of Minerva Medica. To the central dome. supported by a wall. either octagonal or round and completely pierced with niches. is added an ambulatory. The inner wall. instead of a wall with arches as openings. eventually becomes a colonnade with an architrave or. more commonly. an archivolt (Lowrie 135-136). For example. the interior colonnades of such structures as San Stephano Rotundo. Santa Costanza. and San Vitale are ultimately derived from interior niches: the piers of the niches became columns and an ambulatory was added. Occasionally. the niches are replaced by apses. as at the Orthodox Baptistery of Ravenna (Lowrie 137). This plan develops into the typical plan for baptisteries in the Latin West: an octagonal or circular plan with an inner octagon of eight columns which support a dome. The Lateran Baptistery. Santa Costanza. and the Orthodox and Arian

Baptisteries of Ravenna all follow this basic plan (Davies 101-102).

The wide range and development of the central type should not be underestimated or down-played. Centrally planned Christian structures are innovative and original, but they are also clearly derivations from earlier Classical buildings such as the Pantheon and the Temple of Minerva Medica. Centrally planned vaulted structures became the structures for Christianity's most sacred sights. Some of the earliest and most famous churches were the central type like Constantine's church at Antioch (Lowrie 139-140) or the Anastasis in Jerusalem. These churches are clearly based on the classical models (Krautheimer 74). While these churches were the grandest of their type, they still would become models for centrally planned Christian structures. These churches were models for churches from Rome to Constantinople, but the model derived from the Pantheon never seems to have been used in North Africa. North Africa makes a clear break with the classical past and abandons the model derived from the Pantheon in favor of fresh, new, inventive forms. Rome remains true to its traditions.

Christian Roman centrally planned structures have a clear derivation from earlier structures whether the structure is used as a baptistery, mausoleum, or a church. The standard type for Roman baptisteries was established early, and as soon as the Church was free to build as its own public edifices without harassment from the Imperial government, baptisteries became free standing structures (Kostof 55). The earliest surviving baptistery built in the West is the Lateran Baptistery in Rome, also known as San Giovanni in Fonte. It was originally built by Constantine (c. A.D. 315-324) in an octagonal form which apparently was already becoming the form typical for baptisteries on the Italian peninsula. The Lateran Baptistery was copied many times over in Italy and Gaul (Macadam 215). It was later remodeled by Sixtus III. A clerestory and ambulatory were added. The Lateran Baptistery essentially became a smaller version of Santa Costanza (Krautheimer 90). In Rome, it is clear that a standard type, the polygon, for baptisteries becomes established very early; in North Africa, however, innovation with a variety of types continues until the Arab conquest shortly after A.D. 622.

Santa Costanza (A.D. 324-6) was built in Rome by Constantine, and it is typical of buildings of its type built during Constantine's reign (Krautheimer 67). Although it was built as a mausoleum, it follows the typical plan for baptisteries and it was used a a baptistery for the adjacent basilica of St Agnese (Davies 102). The windows around the drum beneath the dome are for light and correspond to a clerestory in a rectangular basilica. Still, St. Costanza is like the Lateran Baptistery and San Stephano Rotundo: it is the same simple form derived from Classical models like the Pantheon and the Temple of Minerva Medica. These buildings are new styles, but their derivation form earlier predecessors is obvious. The baptisteries and martyria of North Africa make a much more daring break with the past.

It is clear that the Early Christian architecture of Rome is based on basic forms derived from Classical Roman models like the Pantheon. These three buildings are all essentially the same building with only size and minor details differentiating their plans. The type of these three buildings shows a very clear derivation from the Pantheon. This type, common throughout so much of the Roman world, barely appears in North Africa. While Roman Early Christian architecture almost becomes static in its commitment to a fixed type, North African Christian architecture increases in experimentation and innovation, and develops a further break with the Classical past. Rome, after developing Early Christian architecture, was turning to its Classical heritage, looking to early classical models in an attempt to recreate some of the grand pagan architecture in a Christian setting. Rome became static in its architectural styles while North Africa became more and more inventive.

Unlike Rome and even cities in North Africa such as Carthage, Ravenna was a backwater until it enjoyed sudden imperial patronage as the capitol of the Empire. In A.D. 293 the capitol of the Empire was moved from Rome to Milan. In 402 the capitol was transferred from Milan to Ravenna. After Italy fell to the Ostrogoths in 476, Odovacer became king of Italy. In 488, the very much romanized Theodoric (495-526), who had close contact with the Eastern Roman Empire, defeated Odovacer and set up a kingdom and ruled from Ravenna. However, Theodoric never severed ties with the Eastern Roman Empire, and, like most of the Western barbarian kings, he considered himself a virtual vassal of the Eastern emperor (Krautheimer 93, 181). Hence, even under Gothic rule, Ravenna was importing architectural styles and ideas from Constantinople. Ravenna, like Rome, would employ fixed, derived styles imported from Rome and Constantinople. Ravenna would not invent its own styles and forms like North Africa. The main examples of Early Christian centrally planned vaulted structures in Ravenna are the Orthodox Baptistery, the Arian Baptistery, San Vitale, and the Tomb of Theodoric.

The most magnificient Early Christian building of Ravenna only goes further to prove the unoriginality of Ravennate architecture. San Vitale was built in 546-548. It is of the same style as San Costanza: an octagonal or circular structure surmounted by a dome and surrounded by an ambulatory. San Vitale, however, has Eastern features such as a gallery (Lowrie 112-113). It has an inner wall pierced by niches and surrounded by an outer wall. It does not have an exact counter part in Rome. San Vitale is an Eastern import, commissioned and built by Justinian, who was reconquering the West. San Vitale is an very good example of how the architects of Constantinople developed the centrally planned church. It is a very innovative building, but it is Eastern, not Ravennate. The centrally planned church was overwhelmingly favored in the East (Edgell 163-164). It bears a strong resemblance to Ss. Sergius and Bacchus in Constantinople, which was modeled after Constantine's church at Antioch (Davies 62. Lowrie 139-140, 146). It is very likely that San Vitale was copied from Ss. Sergius and Bacchus; after all, Justinian commissioned both structures and may have used the same architect. Its plain exterior and polygonal shape are also imports from Constantinople (de La Croix 272). San Vitale has all the magnificence and innovation that the Byzantines could apply to centrally planned architecture. It is San Vitale's magnificence that proves the point: San Vitale is of an imported style, not a style original to Ravenna.

By 380 the architectural types of Christian architecture had been standardized; the search for new types of Imperial Christian architecture was over. This standardization was especially evident in Rome, but it was evident in all the main centers of the Empire, including Constantinople. Even baptisteries had become standardized, and the octagonal form was the standard (Krautheimer 93-94). In North Africa however, these standards never became accepted; baptisteries in North Africa kept the conservative square form or they embraced radical new forms such as the concave square. North Africa forged its own brand of Christian architecture, even the Byzantine reconquest did not lead to a significant imposition of Byzantine styles on North Africa. On the other hand, Rome shows a clear line of development from its earlier Roman sources while Ravennate architecture is imported from Rome and Constantinople. Yes, North African Early Christian architecture shows a clear line of diversion from its Roman sources. North Africa remained unique, in its very structures, and even in their placement. North Africa develops its own version of Early Christian architecture.

To follow are excerpts and arguments of a research paper completed for the Honors Department at Brooklyn College. The paper focuses on images of Hawaiian identity from the 19th through the 20thC and argues against a dichotomous approach to culture which limits understanding to a "native" (subjectivist) perspective or a "foreign" (objectivist) perspective.

INTRODUCTION

In November of 1995 Clifford Geertz the highly acclaimed guru of anthropology reviewed two then recently released books, one by Gananath Obeyesekere entitled The Apotheosis of Captain Cook: European Mythmaking in the Pacific, the other by Marshall Sahlins, How 'Natives' Think, About Captain Cook, for Example. His review, "Culture War," printed in the New York Review of Books, encapsulated the ongoing academic debate between a *subjective*-- "psychological," "moral," "holistic," or "universal"-- perspective and an *objective*-- "sociological," "empirical," or "diverse"--perspective that stands at the heart of both authors' contrasting viewpoints. Obeysekere, fighting to claim Hawaiians as "rationale" (in otherwords like the Professor who is culturally translating them), becomes representative of subjectivist or "native" thought, while Sahlins portraying Hawaiians as existing within their own cultural schema becomes here Geertz's leading advocate for an objectivist approach (4-5). Despite Geertz's self-professed preference for Sahlin's structuralist arguments, an approach he labels as more "persuasive," "penetrating," "less prey to the confusing noises of the confused" (6), he ends his article with academia's necessary mantra to "keep the conversation going," maintaining that only by continuing opposition will "the level of anthropological disputation . [be] raised," that only through divisiveness will there be progress(6). Yet two years after the publication of Geertz's review, and countless years past Academia's ongoing conversation about "difference," the debate between a subjective and objective perspective still finds itself caught in a binary tug-of-war, with more and more scholars rushing to catch hold of either side of the rope. The once touted linear road to progress finds itself held by its oppositions which rather than enticing movement serves only to promote further stasis.

[Comparing a report I completed two years ago which argued for a diverse reading of Hawaiian culture (Hawaiians as "other") to the position of Haunani-Kay Trask, Dean of the Hawaiian Studies Department at the University of Hawai'i and a leader in *Ka Lahui Hawai'i*, a pro-sovereignty political organization, who argues for a holistic reading of Hawaiian culture (Hawaiians as possessive of a hegemonic culture), I closed my introduction with this paragraph:] Yet Trask's argument of 'sameness' and my own argument of 'difference' really argue one and the same point. They are both two faces of the same coin; for both uphold the same 'foreign' and 'native' dichotomy, read here as dominant and residual: the argument of sameness for operating under the same standard of dominance and the argument of difference by reinforcing the ideology of dominance through its opposition. The definition of culture produced here is inevitably static with both approaches serving to limit and control the understanding of culture by its refusal to upset the established hierarchy. For both Trask and myself, what is deemed "humorous" (Hawaiian *kanaka*) and "sexual" (Hawaiian *i'ini*) is opposed to what constitutes Hawaiians as "authoritative" and "autonomous." Continuing along the same dichotomous *progression*, we both seek to perpetuate images of Hawaiian culture which portray Hawaiians only as moral, modest, well-educated, politically strong and potentially prosperous-- in other words, as perfect embodiments of America's middle-class ideals. Yet I think we both forget that there was a time when humor and sexuality was very much a part of Hawaiian ideology, part of its authorial make-up, when culture was more than just a measure of strength, aptitude and wealth. Simultaneously, we should remember that if we are to talk about "Hawaiian Culture," if we are to describe it, reclaim it, construct it, these attempts include accepting a 200-year history of domination; it includes accepting the image of the *kanaka* and the *i'ini* as reflections of who Hawai'i is: what we have been re-written to be. We should remember that it is not so easy to isolate, despite the prophecies of Clifford Geertz, opposing interpretations of culture. That we by continuing to perceive culture through static oppositions of subjective/objective, dominant/residual, strength/sex, laughter/authority, neglect to consider that definitions alter, interpretations evolve and that images of "tradition," whether we like it or not, inevitably change.

BODY (segmented into four parts)

1. Legends, Myths, Dance and Song: Kalakaua, the Merry Monarch.

This section looks at representations of Hawaiian identity from the early 19thC, focusing on the effects of the 1820 arrival of New England missionaries in legend and song and the subsequent reassignment or splitting of Hawaiian culture into categories of official (serious) and non-official (funny or sexy).

2. The Trickster and The Dancer.

This section looks at the incorporation and isolation of "sex" and "humor" (as opposed to notions of "authority" and "strength") in the re-interpretation of the *Makahiki* (festival of harvest) by Kalakaua, the new lyrics of 19thC *meles* (song) and the replacement of chants (*mo'olelo*) which were re-defined as "too serious" with song. It also focuses on the 1959 switch of Hawai'i's economy from agricultural to commercial (i.e. tourism and land development), the influence this change of economy had on school curriculum and, lastly, the generated iconography of Hawaiian culture this new commercial economy produced: advertisements.

3. From Brothers to Blallahs: Hawai'i's *Kupakahi* ("mixed up") World.

This section introduces Hawaiian Creole: the language of diversity possessed by the multi-ethnic community of Hawai'i and the ever-expanding role of the *kanaka* now an icon of nativism. The rise of pro-Hawaiian political movements and the social divisiveness which ensued in the eighties as more and more political organizations emerged, each claiming to speak "for the people," is presented as threatening to this multi-cultural fabric of Hawai'i for perpetrating once again the same categories of official (serious) and non-official (funny or sexy).

4. *'Aka 'Aka*: The Sound of Laughter.

The role of the *kanaka* as "a social indicator of historical developments and social changes" is focused on in this section. In contrast to the political organizations of the seventies and eighties, the *kanaka* image, as represented by Hawaiian comedians of the 1970s-90s is not seen as limiting or selective: the affable and humorous image introduced in the 19thC begins to, in the 20thC, incorporate the attributes of strength and authority. By the 90s there is no longer a separation between the *kanaka* image (the comedic persona) and the man (the comedian) with the introduction of Bu la'ia, a comedian who ran for governor of Hawai'i and received over 5,000 write-in votes.

CONCLUSION

Perhaps the acceptance of Bu as a potential governor is due to the development of the American Entertainment State and the now historical precedent set by such entertainers-turned-politicians as Ronald Reagan, Clint Eastwood, Sonny Bono and Fred Grandy (Gopher from *Love Boat*). In their roles, these entertainers embodied an ideal people identified with, be it the affability of Reagan or the raw courage and personal honesty of Eastwood. If John Wayne were alive today, chances are he would be President. However, by all accounts Bumatai's Jr. Boy, Delima's Blallah, and Kaui Hill's Bu La'ia are not ideal: they appear questionable heroes at best, with their enlarged hair, blackened teeth and broken speech patterns. Their affability, should the characteristics they promote be understood as self-debasing, is found bordering on sarcasm. And instead of exemplifying a model for Hawaiian youths to aspire to, it could be argued that they promote all which is wrong in Hawaiian society. However, the image of the *kanaka* is the image of Hawaiian society, an image come to life in the hotels, schools, and the tented state-park homes: this has become the new tradition of Hawai'i. To appreciate the humor, there needs to be an understanding that the *kanaka* image is an emergence of two cultures meeting together, a meeting of representations and self-perceptions: one image which is neither "foreign" *or* "native," "dominant" *or* "residual" (a division prioritizing one over the other): it is necessarily and simultaneously both. Rather than deny this heritage, these *blallahs* and *bu la'ias* remain the only ones to speak from it. They are the only ones who remain truly "Hawaiian" for they do not seek to view their world divisively. Even failure is simultaneously understood as victory as Bu's parting words to the winner of the 1995 gubernatorial election, Ben Cayetano, reflects: "You bettah take care da Washington Place [the governor's mansion]," he warns, "cuz I goin be dere pretty soon-- so no wreck da place eh!" With the next gubernatorial election scheduled for 1998, the question remains, will the majority of Hawai'i's voters decide to take this comic seriously?

Mexican Catholicism:
The Syncretic Result of the Spanish and Indigenous Religions in Contemporary Mexico

Dr. Susan Deans-Smith

INTRODUCTION

Since the arrival of the Spaniards and the conquest of the great Tenochtitlan, the Roman Catholic Church has played a key role in the life of New Spain and independent Mexico. Shortly after arriving in the New World, the conquistadores and friars began spreading Catholicism among the indigenous populations. The Indians were engaged in learning the new religion, but adopting it did not happen overnight, much less peacefully. However, little by little, Catholicism infiltrated the New World's folk religion. By 1810, Catholicism had permeated New Spain's society so deeply, that Father Miguel Hidalgo led the fight for independence with a standard of the Virgin of Guadalupe as the national symbol. The Catholic faith came to dominate the life of the New World.

Distanced by almost five centuries, Mexico has developed its own Catholicism characterized as a mixture of Spanish and Indian religions, in which remnants of both can still be seen today and traced to their origins. Nevertheless, even when the origins have been found, the contemporary results of the initial syncretism cannot be separated into its original components. The mixture has become an intrinsic part of twentieth-century Mexico, where religious syncretism still plays a very important role not only in religious holidays, but in day-to-day life as well.

The purpose of this paper is to show how Catholicism, being the predominant religion in Mexico, exists in a heterogeneous form. This is the syncretic result of Spanish Catholicism mingling with indigenous beliefs and rituals from the time of the conquest through the colonial period and up to contemporary Mexico. Because of the breadth of the topic, Holy Week festivities are the focus of this work. Holy Week lends itself as a case study because it encompasses the climax of Christ's life on earth and forms the substantive basis for Catholicism.

HOLY WEEK

In order to talk about Holy Week, it is necessary to establish a common understanding of the Major or Greater Week for the Catholics and its meaning. Holy Week is, "[t]he week immediately preceding Easter Sunday in which is recalled the memory of our Lord's last days and passion before the resurrection. The liturgical prayers and ceremonies of the week . . . show Jesus Christ as the triumphant Messiah and the suffering Redeemer . . . "(Attwater, 235). Holy Week begins with Palm Sunday. This day commemorates Jesus' entrance into Jerusalem. Its name came about because the people who gathered to receive Jesus (after fasting for 40 days -- Lent -- on Mount Olivet) greeted him with palm leaves. Monday, Tuesday and Wednesday are days of mourning, for Jesus' crucifixion is coming. Maundy or Holy Thursday is the commemoration of the Holy Eucharist, or the famous Last Supper. Also, the betrayal of Jesus by one of His apostles --

Judas Iscariot, who turned him in to the Roman authorities -- happened on this day. Good Friday is a mournful and sad commemoration of the crucifixion. Holy Saturday remembers Christ's burial and Mary's mourning for her Son. Easter Sunday is a day of joy which celebrates Jesus' resurrection and ascension into heaven according to the Bible.

EVANGELIZATION IN THE NEW WORLD

When the American continent was discovered, Catholicism was transported to the new territories. The Spaniards not only brought a new religion, but with it came a new way of life established by Christianity. In Catholicism, great importance is placed on propagating the faith to obtain forgiveness of sins in order to save one's soul from burning in the flames of hell. And this, precisely, was the idea that the Spaniards brought with them.

The discovery of the New World gave Spain an opportunity to expand not only its dominion but its faith. It provided Spain with an ideal way of preserving and spreading Christendom as a hedge against Protestant success in Europe. The chance of spreading the Gospel in the newly discovered worlds made her feel as the chosen nation, predestined to be the redeemer of the Indian non-Christian (thus sinful) souls.

Isabella (1492-1504) and Ferdinand (1506-1516), were the founders of Catholicism in the Indies. Even though the Church in the New World was a copy of its counterpart in Spain, there were not as many members in the former as in the latter. Actually, a very reduced number of friars would venture to New Spain and therefore, evangelization problems arose. An important problem was language. Most of the time the indigenous languages did not have words for the same concepts the Spaniards were trying to transmit.

The missionaries could not sit down one-on-one to teach the appropriate meaning and concept to the Indians, but even if the friars had time for catechism, there was an imminent need to save the Indian souls as fast as possible: the indigenous population was dying quickly with the illnesses brought by the Spaniards. In order to save the natives' souls, the friars conducted mass baptisms even if the Indians had little or no knowledge of what their christening meant. A friar would baptize four to six thousand Indians in a day.

Once the urgent character of learning the main prayers and erasing the original sin through baptism had passed, an important remaining part of the evangelization was teaching the Bible to the Indians. By studying the Indian customs, the friars discovered a deep interest for music, dancing and painting. The friars devised the idea of preaching the Gospel through theater; after all, it involved those three skills in which the Indians delighted so much.

Representations in the Gospel theater usually corresponded to the major Catholic celebrations such as Christmas, Epiphany, Holy Week, Corpus Christi and Pentecost. The missionaries were in charge of writing the libretti, which were usually in the natives' tongue. The actors and spectators were all Indian. The performances could take place inside a church, but were usually held outdoors, primarily in what are called capillas abiertas or open chapels. These chapels were specifically created for the Indian masses allowing, certainly, a far greater number of spectators (thousands) than those who could fit inside a church. The open chapels were usually located in the church's atrium in a chosen place where they could be seen by the crowd from a distance. The actors were also in great numbers; some written records talk about eight hundred, twelve thousand, etc., participants (Iglesia, Religión, 142).

According to the Spanish chronicles, the scenery for such theatrical representations was not only quite impressive because of its colorfulness but also because it had live animals as well as natural and artificial plants. Music was also an important part of the opening and closing of the Gospel theater. Fray Toribio de Benavente "Motolinía", in his Historia de los indios de Nueva España, refers to the staging in 1538 of Adam and Eve's fall from paradise:

> Adam and Eve's lodging was so ornamented that it seemed like paradise on earth, with various trees with fruits and flowers, some of them fresh and some of them made of feathers and gold; the trees had a diversity of birds, from the owl and other birds of prey to small birds and above all they had many parrots, and it was so much talking and yelling they had that some times they interfered with the action on stage ... There were also some birds that were made of gold and feather really worth seeing. The rabbits and hares were so many, that everything was full of them, and many other funny animals that not until then had I seen (Iglesia, Religión, 142).

The result of these processes was the superficial evangelization of the Indians. Furthermore, some of the Catholic deities were equated to the native ones either purposefully by the friars for easier assimilation or accidentally in the Indians' mind. To mention the most important ones, Tonantzin or Mother Earth became the same as the Virgin Mary, the Mother of Jesus; and Huitzilopochtli, the god of war, became the same as the Archangel Michael, always represented destroying the devil. Some Indians were reverting to their religious practices as a result of not being truly converted. There were rebellions with the purpose of restoring the old -- native Indian -- world order, but the Spaniards suffocated them. On the other hand, some natives began to combine their religious images with the new Catholic ones. Syncretism started here. Even though Catholicism was the predominant religion, the indigenous elements were always present: in 1769 Archbishop Francisco Antonio de Lorenzana forbade "stage representations of the Passion of Christ ... and other dances, because he considered them 'superstitious' and 'irreverent' ... because they stimulated the use of prehispanic languages ... [and] also due to other reasons such as 'drunkenness, paganism, dissipation, idolatry'" (Florescano, 47).

SYNCRETISM IN CONTEMPORARY MEXICO

Two accounts demonstrate the syncretic result of the Spanish evangelization efforts. I do not try to suggest that the Spanish-Indian syncretism can be "peeled," divided into sections and put back together into its original forms. On the contrary, the mixture of innumerable elements of both religions gave birth to a new form of Catholicism, a heterogeneous one, a Mexican Catholicism.

Rarámuri Holy Week

The Tarahumaras, or the Rarámuri as they call themselves, are a population of about sixty thousand natives of Barranca del Cobre (Copper Canyon) in Chihuahua. The Indians call Holy Week "norirawachi." It literally means "when we walk around in a circle" (Triedo, 62), because most of the celebrations are about circling a Catholic church in a continuing and devoted procession. During the Rarámuri Holy Week there is no public: all Tarahumaras are faithful participants in the ceremonies.

The main Holy Week celebration is the conflict between god and the devil. The Rarámuris participate in this conflict by dividing themselves into two groups: the Pharisees who are helpers and allies of the devil; and the Captains and Soldiers whose role is to defend god. Why can't god defend himself? The devil has forced god to drink great quantities of tesgüino (maize liquor) and he has not recuperated yet. The Tarahumara god is drunk, thus weak and vulnerable. It is now the Rarámuri responsibility to protect god and his wife (who is drunk as well) until they are in good health again. Otherwise, the devil will take advantage of the opportunity and destroy the Tarahumaras.

The Rarámuri dance and sing to their music all day long. On Easter Sunday fights between Pharisees and captains and soldiers are re-enacted, the purpose of which goes beyond defeating the devil and honoring God now that he is in good health. The mock fights symbolize the battle between right and wrong. The festivities end and god is satisfied. He will protect the Rarámuri, his children, until he needs their protection again, the following year.

Holy Week in Iztapalapa

Iztapalapa is a borough of Mexico City. Holy Week in Iztapalapa is a re-enactment of the life of Jesus on Palm Sunday, Holy Thursday and Good Friday. On those three days, there is a procession through the streets of Iztapalapa in which thousands of people participate and millions watch.

Bernal Díaz del Castillo describes "Estapalapa" (sic) with great admiration. In Iztapalapa, the Cerro de la Estrella (Hill of the Star) was a sacred place in which the Indians had a temple to the god Tezcatlipoca. With the Spanish arrival, the friars imposed a deity -- El Señor de la Cuevita (The Lord of the Little Cave) -- atop the temple to Tezcatlipoca. The Spaniards used the Gospel theater to teach the Bible to Iztapalapa's inhabitants.

In 1843 there was an epidemic of cholera morbus in Mexico City. Iztapalapa's population was decimated but suddenly the illness ceased. The miracle was attributed to the Señor de la Cuevita. In order to thank him, the staging and processions of Christ's Passion began. Today, the festivities take place in three main areas: the main square, the streets and the Cerro de la Estrella.

During Passion Sunday the houses and streets are adorned with pink and white flowers. The procession parades through the streets while the actors carry palm leaves tied around aromatic herbs -- chamomile, rosemary and bay. The procession's last stop is the church of San Lucas (St. Luke) where a priest will say mass and bless the palms and herbs. Once blessed, the bouquets acquire a certain magic; Iztapalapa people keep them throughout the whole year to cure the sick.

On Holy Thursday the streets are decorated with purple and white bows. The ceremonies begin with a mass said in the sanctuary of the Señor de la Cuevita, followed by a procession visiting each of the eight churches of Iztapalapa. The actors finally reach the main square where the staging of the Last Supper takes place, after the washing of the Apostles' feet. Jesus praying in the grove takes place afterwards "on location" at the Cerro de la Estrella. Watermelons, cantaloupes and mameyes are the decorations for the grove: a tropical conception.

White and yellow flowers decorate the streets of Iztapalapa on Good Friday. The actors playing the role of the Nazarenes carry heavy crosses; there are about two thousand of them. Jesus is imprisoned, later he will be tied to a column and whipped. Pontius Pilate comes on stage and gives the verdict for Christ: he will be crucified. The Via Crucis begins. Jesus crowned with thorns carries his heavy cross, falls three times and the stations of the cross culminate on the Cerro de la Estrella where Christ is crucified. On the cross, Jesus pronounces the last of His seven words "All is consummated." There is a collective ecstasy flowing in the air.

To meditate the sacrifice that Jesus Christ just made for the human race, His crucifixion is followed by a silent procession down the Cerro de la Estrella through Iztapalapa. Hooded youths carry a statue of the Señor de la Cuevita. Devoted and faithful Iztapalapa pays homage to the saint, thanking him once more, for having relieved them from the terrible cholera morbus.

The accounts described above portray Holy Week celebrations in both very similar, and very different ways. The similarities are found in the Catholic core belief of Jesus Christ and His Passion, and the need to celebrate and re-enact this event year after year; the differences vary. The Rarámuri, believe in Jesus Christ, but He is also the Sun and there is not a Holy Trinity as in the Father, the Son and the Holy Spirit. The Lord of the Little Cave in Iztapalapa, superimposed on Tezcatlipoca, is someone who needs a yearly sacrifice consisting of the representation of Christ's Passion. The idea of keeping the deity happy to avoid bad times (in this case the return of cholera) still persists from ancient times. Syncretism is a continuum, a dynamic religious culture in Mexico that is constantly evolving and changing.

CONCLUSION

It is practically impossible to erase completely the religious habits, beliefs and symbols of a given culture and impose new customs. After five centuries of history, the visible religious remnant of the Spanish conquest is not a superficial Catholicism imposed upon native beliefs, but a deeply imbedded new faith, Mexican Catholicism.

By the ever changing nature of culture, a religious stasis is not encountered in Mexico. On the contrary, a process of constant accommodation and modification of new cultural elements is always happening. Despite some new additions, many of the Holy Week's celebrations in Mexico today are lively remnants of the evangelization process; some other remnants are a part of the native religious celebrations. Whatever the case, those celebrations have become an intrinsic part of the Mexican religious culture with a very special flavor due to its dual heritage.

Rocky Road: The Long Journey to Educational Freedom in Prince Edward County

George Bagby and Lowell Frye

EDUCATION IN FREE SCHOOLS WAS NOT ALWAYS LAW

Blacks in the South have experienced many hardships, especially in the school systems. Public education in Prince Edward County, in southside Virginia, did not begin until 1870 after the Underwood Constitution of 1867-68 took effect. The schools were segregated, and the black schools were always at a disadvantage. Unlike white children, black children did not have proper materials or even adequate school buildings. Although there were more black children than white children who attended school in Prince Edward, the white children got a better education.

Education for whites was developing at a moderate pace and even more slowly for blacks when the Civil War broke out. The Literary Fund, intended as support for education, was then used to provide additional money for military defense, as directed in the state convention on June 26, 1861 (Maddox 170). Once the Civil War was over, the negative attitude of white people towards free schools became stronger than before. Blacks and a few white radicals proposed that the system be completely democratized by letting blacks attend school along with whites of all classes, so they would be seen as equal individuals (Maddox 170). Blacks believed that only by having the schools mixed could equality be guaranteed. If both blacks and whites were taught in the same classroom, then each student would get the same information, and neither race would miss out. Blacks realized that education was the key to a better future for the black community. Although blacks had support from some white people, that support was not enough, and the idea of mixed schools was rejected. In Prince Edward County, as well as in other counties, public schooling was not a popular idea.

New and recurring factors started to play important roles in the development of a public school system: for example, the belief in a real need for education in order to make the republican government advance into the future; evidence that school funds, societies of public schools, and others could not afford the distribution support (Monroe 232). The Underwood Constitution of 1867-1868 was accepted at a convention that established public school systems by 1870, and the Constitution spoke clearly on the subject of public education (Maddox 171). The Virginia School Report of 1871 reported that on February 10, 1870, the General Assembly met and listed what was required: school houses, school furniture (a bucket and ladle, broom and brushes, blackboards, wall maps, etc.), school expenses (fuel to make fires), school books for poor children, record books and stationery for the Board of Trustees, pay for district clerks, and expenses for special elections (Annual Report of the Superintendent of Public Instruction 2). On July 11, 1870, an act to establish and maintain a system of public free schools was approved by the United States.

PRINCE EDWARD COUNTY'S SCHOOL SESSIONS

For the 1870-1871 session at Prince Edward, twenty-two schools (eleven for white students and eleven for black students) were dispersed throughout five electoral districts: Buffalo, Hampden, Farmville, Lockett, and Leigh. There were 849 students enrolled (371 [27.4%] whites and 478 [20.5%] blacks) of a school age population of 1,353 white children (659 males and 694 females) and 2,330 black children (1,364 males and 966 females), giving a total of 4,110 (Virginia School Report 184). The cost of tuition per month for each student who was enrolled was $1.29 and the cost of tuition was $1.75 per month per student. Twenty-seven teachers (eighteen white men, eight white women, and one black woman) taught the children in the five districts. Black teachers had a hard time finding jobs as teachers because the white people saw blacks as inferior and because training was expensive and not possible for most blacks. The monthly salary for male teachers, $43.22, was higher than that for female teachers, $33.08.

For the session 1871-1872 in Prince Edward, thirty-five schools opened with thirty-seven teachers and 1,296 students enrolled (638 white and 658 black). During this period the idea of creating graded schools had been spreading in other counties, but it did not reach Prince Edward until the session of 1872-1873. The Farmville Colored school, whose principal was Richard V. Watkins, a white man, was the first graded school in Prince Edward County. The school had three grades along with three teachers and ninety-six students. The average attendance was seventy and the school was taught in a five-month session. The cost of tuition at the colored graded school that was paid by the parents was $0.83 per month per student. The graded schools grouped the students in grades according to how much education they had, instead of grouping all the students together. The graded school let the black students be placed in classes that were set according to the students' levels of education (Bradshaw 491). The accomplishment of getting a graded school showed that the black community had pushed hard to get better conditions for black students. The number of teachers in the schools generally was regulated by the number of grades in the schools (Virginia School Report 188).

In every succeeding school session there was a significant increase in the number of students who enrolled in Prince Edward's schools. In 1874-1875 the school age population between five and twenty-one years for whites was 1,472 and for blacks 3,083, giving a total of 4,555 students; however, 667 (45.3%) white students and 834 (27.1%) black students were enrolled in Prince Edward. Although black students outnumbered white students, black students had fewer schools and fewer facilities. There were thirty-seven schools (twenty-one white and sixteen black) opened in Prince Edward, which ran an average session of six months with thirty-seven teachers (thirty-two white and five black). Although the black students had more students enrolled in Prince Edward schools than whites, blacks still had fewer school buildings. The black students were in crowded conditions because black education was not seen as an important matter for the all-white board. The white school did not have an overcrowding problem or a crucial need for better facilities. There were forty-seven teachers, but only five of them were black (two men and three women). In 1882, five people of the Farmville Colored school signed a petition asking for a black teacher who was as qualified as the white teachers to be employed, but the trustees told them that no qualified black teacher had applied (Bradshaw 491). The employment of black teachers was not a major concern in the county. Since most white people thought education for blacks was not important, whites did not see a need to employ black teachers for black students.

Despite the resistance of whites; by 1890-1891, the number of black teachers had increased dramatically. There were thirty-one black teachers (twelve men and nineteen women) and thirty white teachers (eight men and twenty-two women). The increase in black teachers may have resulted from the fact that more black teachers were being certified by black schools such as Virginia State Normal school. There were a greater number of blacks who applied for positions. There were 2,895 (866 whites and 2,029 blacks) students in sixty-one schools, of which thirty-one were black schools and thirty were white schools (Virginia Reports 1890-91 p.10).

ESTABLISHMENT OF HIGH SCHOOLS

In Virginia the legislature had authorized the establishment of high schools as early as 1875. The first serious attempt to establish high schools was made in 1906, but these schools were mostly for whites (Ryan 21). The Virginia legislature appropriated $50,000 in 1906 to be used in the development of public high schools. In 1906, J.D. Eggleston of Prince Edward was appointed State Superintendent of Public Instruction. Eggleston devised a plan in 1906 to have the state appropriate money for district high schools and to have the localities provide buildings and matching funds to support the new high schools (Bradshaw 494). The school building would contain three classrooms on the first floor and a town hall on the second floor (Bradshaw 494). The principal's salary of $250 would be provided by the Southern Education Board (SEB). On May 1, 1906, a meeting in Rice established a district high school. The people had plans to raise $1000 for the building and $300 each year for the next five years in order to support the high school. By the fall of 1907, all districts in Prince Edward had a high school except for Buffalo.

Whites disliked high schools for blacks because secondary education meant more education than just knowing how to read and write. By 1920, all but three counties in Virginia had high schools. However, there were only sixteen black high schools with a total of 297 black students enrolled. The white students enrolled in high schools totaled 22,061 in 1920 (Link 189). Most black students did not have an opportunity to get a secondary education. Therefore, black students did not get an education equal to white students' education. Most whites believed that blacks did not need further education than what was taught in the elementary school. Whites thought that the blacks should not spend so much time in schools but more time in the fields.

THE BLACK COMMUNITY WANTED SCHOOL FACILITIES IMPROVED

The county school board was established in 1922 when the district school boards were done away with. Within the same year, all the white schools in the Lockett District were consolidated with those in the Rice District. In the next five years, all small white schools in the county were eliminated through consolidation, and six district high schools were built-- Darlington Heights, Farmville, Green Bay, Prospect, Rice, and Worsham (Bradshaw 497). At this point, there were still no black high schools in Prince Edward. Again, blacks were not permitted by whites to go to a high school in order to acquire a higher level of learning, as white students did.

Between the years of 1923 and 1927, all white school children in Prince Edward were

BEST COPY AVAILABLE

put in brick buildings with heat and proper ventilation. They also had a safe water supply and transportation by twenty-two school buses if they were not within walking distance. Blacks, on the other hand, had small buildings that allowed cold winds to come through in the winter. Blacks did not have any transportation to carry them to school. Black students had to walk miles in the snow and ice just to get to school during the winter (Allen).

During this period blacks in Prince Edward County were always trying to improve the education system for their children and to push for adequate materials, education, and funds such as the whites had for their schools. On February 5, 1924, at a school board meeting, a committee of three black men from the Farmville area asked for the establishment of an eighth grade in Farmville Colored School and for other improvements, such as remodeling the school building so it would be suitable and sanitary (School Minutes Feb. 5, 1924). The eighth grade was finally approved after many visits from the committee, but not much was said about remodeling except for repairing the roofs of the colored school in the Farmville District. Then on February 3, 1925, a petition asking for a new school building was presented to the board by patrons of the Farmville Colored School. The patrons also asked how much they would be responsible for raising in order for the building to be constructed. An answer was not to be given until a later date (School Minutes Feb. 3, 1925). During this waiting period, on June 11, 1925, a motion was made and carried to adopt a salary scale for black teachers. Those teachers with elementary certificates were paid an additional $50 per month with an increase of $2.50 per month every year for four years. Those teachers' salaries were still well below what white teachers received, a salary of an extra $600 and up (School Minutes June 11,1925). The black committee was constantly trying to improve the black children's educational system because the committee saw how important education was and how many opportunities there were when a person had an education. On June 30, 1925, the vote for a bond issue of $60,000 held in the Farmville District was rejected by eighteen votes (School Minutes July 7, 1925). Some patrons of Farmville Colored School came to the school board on August 5, 1925, to request repairs for the old building so that it could be used the next session. They asked for a room to be used to grade students' work and for larger pipes so that water pressure would be better (School Minutes Aug. 5, 1925).

On April 6, 1926, the school board finally declared the Farmville Colored School totally inadequate--poorly lighted and unsanitary. This was the start of planning for a new black school. The contract to build the Farmville Colored School was given on August 6, 1926, to the Motley Construction Company for $27,743.79 and to W.J. Bloomfield of Blackstone, Virginia, for $2,525 to equip the building with heat. Motley Construction Company asked for eight months to complete the building, but the company said that construction would be complete in six months if possible (School Minutes Apr. 6, 1926). The patrons of the Farmville Colored School had to raise $5,000 toward the new building. At this same time, the Farmville High School for whites was building an auditorium, gymnasium, and office that cost approximately $35,000. The whites did not have to raise any money for their additions to the Farmville High School. The school board spent more money on the white school than on the black school.

The new Farmville Colored school, the building presently known as the Farmville Recreation Center on South Main Street, had a capacity of 400 students and was made out of brick and contained eleven rooms, an auditorium, and a gymnasium (Today & Yesterday... 79). The new Farmville Colored school opened in the fall of 1926. It had 152 black students in the high school, which had only the eighth grade and was on the second floor, and 280 black students in elementary grades on the first floor during the first year. The students who attended the eighth grade came from the surrounding counties, but those in elementary school came only from Farmville. When it opened, the colored school had already exceeded its capacity. In the construction of the Farmville Colored school, the school board once again did not pay close attention to the needs of the black community. Mr. Joseph B. Pervall was principal, along with ten trained teachers who were all college graduates. The school was recognized by the Southern Education Board (SEB) as an institution that maintained the standards for its graduates to proceed in higher education. This school was named R.R. Moton, in honor of Robert Russa Moton.

The construction of a new Farmville Colored school was a great accomplishment, but the black community continued to push the school board for better conditions. For example, on April 12, 1927, three people from the Council of Colored Women (Martha E. Forrester Council of Women), which was established in 1920, requested three things from the school board: 1-they wanted a say in the choice of teachers who would teach in the Farmville Colored school; 2-they wanted to have local people appointed as teachers; and 3-they wanted to have the compulsory attendance law enforced (School Minutes Apr. 12, 1927). Also a committee of blacks from Farmville came to the school board on August 8, 1928, and asked for ninth and tenth grade in the Farmville Colored school for the upcoming session. John Allen, Nathan Miller, and others said that nineteen students were ready for the tenth grade. The school board responded by telling the blacks that there was not enough money available to hire an extra teacher for that year--a cost of around $800 or more. The school board said that if the patrons of the Farmville Colored School could raise the money and place the necessary amount of cash or negotiable paper in the hands of the board by opening day of school, the school board would be happy to employ a teacher in the school and provide a ninth and tenth grade (School Minutes

Aug. 8, 1928). The patrons of the Farmville Colored school as well as the Council of Women did raise the money for the two new grades. This requirement was an example of the injustice at work because the black community not only paid county taxes for education, but also had to pay for these additional grades in the colored school. The white citizens never had to raise money to add grades to the white school.

During this period, black students walked to school--children as young as five years old walked to school while the white children rode on school buses. On February 5, 1935, a delegation from the R.R. Moton School came to the school board asking for transportation and for additional rooms to be added to the already overcrowded school building. The school board told them that the school bus situation would be taken into consideration. On April 2, 1935, a motion was made on the matter of transportation of the black students to the R.R. Moton School, but a decision was delayed until a later date (School Minutes Apr. 2, 1935). Committees from different districts that attended R.R. Moton High School came to the school board many times from 1935 to 1941 and beyond to ask for transportation to the school. Finally on August 6, 1941, the Board agreed to provide second-hand buses to transport students, provided that each pupil pay ten cents per day. It was not until February 24, 1937, however, that the school board actually gave a reason for not starting to prepare for a new R.R. Moton High School. The school board said that there was an emergency at the white Farmville High School. During that same year, on September 1, some blacks from the community appeared before the school board asking about plans to enlarge R.R. Moton School in order to end the overcrowding, but again, "no definite action was taken" (School Minutes Sept. 1, 1937). Then on October 6, 1937, the school board finally attempted to resolve the problem by renting a room for $2.50 per month near the R.R. Moton School so that it could be used as a classroom (School Minutes Oct. 6, 1937).

THE OVERCROWDING SITUATION

The school board began to think more seriously about the overcrowding at R.R. Moton when the motion was made and carried and filed with the State Board of Education in order to get a loan from the Literary Fund for $49,500 to meet the Public Works Administration (P.W.A.) grant of $40,500. The Anna T. Jeanes Fund application was soon made by the school board so the board could get an appropriation of $4,000 toward the construction of the colored high school (School Minutes Aug. 12, 1938). By this time, the school board paid more attention to the construction of a new high school. On September 8, 1938, the school board authorized the purchase of additional land for the R.R. Moton high school. And within the same month, the school board hired the Farmville Manufacturing Company to construct the new building for $36,952 (School Minutes Sept. 8, 1938).

Moton High School was built in 1939 at the intersection of South Main Street and Griffin Boulevard in Farmville. The school had ten rooms and a 180 student capacity. One hundred and sixty-seven students were ready to attend the school when it first opened. The Moton High School was the first separate school for black high school students in Prince Edward County. As the years went by, especially in the 1940's, enrollment in black high schools grew very rapidly; in 1940, in Prince Edward there were 219 black high school students; by 1950 there were 477, all of whom still attended the 180-student-capacity Moton High School. This growth was a major concern for the black community because to the blacks, it seemed that the county did not plan for adequate education for black students. In the early 1940s, parents of the Moton students formed a Parent-Teachers Association in order to stop the overcrowding. On June 28, 1945, Superintendent T.J. McIlwaine reported to the school board that the R.R. Moton combined Elementary and High School building (presently the Recreation Center) was "inadequate to accommodate" students; he suggested that four rooms be added to the high school (School Minutes June 28, 1945). After many ideas had been discussed, finally in May of 1947, the school board got a $50,000 appropriation from the State Board of Education to build yet another new R.R. Moton High School.

On June 3, 1948, a plan to construct temporary buildings to stop the overcrowding in Moton was created by T.J. McIlwaine, Superintendent of Schools. Maurice Large then asked the Board of Supervisors about the idea, and the Board of Supervisors told the school board not to spend more than $25,000 in relieving the congestion. This amount was just enough money to build three tar paper shacks in 1948-1949 which helped with the overcrowding problem, but not with the black children's or black community's self-esteem. A three-man committee was appointed to find a place to put a new Moton High School (Smith 18).

The Moton PTA saw that the three-man committee was going to get little done, so the black community asked the school board if black people could help look for a site for the new Moton High School. The school board accepted the Moton PTA's offer. Soon the committee told the school board about fifteen acres of land about three miles south of Farmville on Route 15 which could be bought for $8,000. The school board was astonished by the quick report on the site from the PTA. The board was also amazed that the PTA was willing to have a school away from town, but the PTA and the black community desperately wanted a new Moton High School (Smith 22).

The construction of the new Moton High School would cost $800,000. The local bond issue would have to be about three-quarters of a million dollars (Smith 25). One reason for spending so much money on the black school may have been that the school board of Prince Edward County was trying to inhibit the possibility of a future lawsuit by the blacks about unequal facilities. During this period, other public school lawsuits elsewhere in Virginia were about to begin. The NAACP was ready to file suit to desegregate Pulaski County High School and others.

The conditions at the Moton High School were getting even worse as the planning for a new school progressed. A sixteen- year-old girl, Barbara Johns, was one of the Moton students who grew tired of having to learn in the grim conditions of the school, so she decided to do something about the conditions. Barbara Johns and some other students began to meet about the condition of the school and to discuss what they could do to make people listen. Barbara Johns knew that the only way people would listen to them was if they took action, and quickly.

In April of 1951, the students of Moton High School walked out of the school and did not return for two weeks. They were led by Barbara Johns. The NAACP attorneys, Oliver W. Hill and Spotswood Robinson III, were asked to represent the students in court about the conditions and desegregation of the school. The NAACP took the case to the Supreme Court where it became one of the five court cases to make up *Brown v. Board of Education of Topeka.* During this time, the new R.R. Moton High school was built and occupied on September 8, 1953.

On May 17, 1954, the Supreme Court decided that segregation in the public schools was unconstitutional and that the schools should be desegregated. After the decree, the black community rejoiced, but the white community was very upset with the idea that their children would have to be educated with black children. So a private school group appealed the Court's decision and on July 18, 1955, the three-judge federal court ruled that Prince Edward County did not have to desegregate its schools for the 1955-1956 school year but must desegregate at a future date (Smith 125). In return, NAACP lawyers filed motion for the schools to be desegregated right away. After the back-and-forth battle, on June 2, 1959, the U.S. Fourth Circuit Court of Appeals ordered that Prince Edward schools be immediately desegregated (Smith 151). At this point the Prince Edward school board announced on June 3 that the supervisors would not let the school board appropriate any money for the public schools, a decision which meant that the public schools would close. This announcement also meant the black children would have no school to go back to. For the white children, a private school was going to open. On September 14, 1959, Prince Edward Academy opened for white students. Black students had no school to attend in Prince Edward.Black children were without schooling for five years in Prince Edward County. Some black children left to live with family in the North in order to get an education, while others stayed in Prince Edward and just got jobs. In September 1961, the NAACP asked the State Supreme Court of Appeals to force the Board of Supervisors to appropriate money for the schools. It was not until the year 1964 when the Supreme court ruled that Prince Edward must reopen its schools, after nearly 1,600 Negro students had been denied education since 1959.

THE UNIVERSITY OF NORTH CAROLINA at ASHEVILLE
JULY, 1997

Foreword for the
Proceedings of the Eleventh National Conference on Undergraduate Research

University of North Carolina at Asheville
April 24-26, 1997

The University of Texas at Austin was pleased to host the 1997 National Conference on Undergraduate Research, affirming its commitment to excellence in undergraduate education and to the research experience in particular. Over 2100 students and faculty attended some 1500+ oral, poster and performing or visual arts presentations scheduled over April 24-26. A special feature of NCUR '97 was a series of more than 30 presentations by faculty members from all disciplines demonstrating the integration of research and teaching with the new technologies. These presentations were capped by a performance on Saturday night of "Ears and Feet," a concert of new interdisciplinary work by student and faculty composers, choreographers, dancers and performers from the UT College of Fine Arts. Electro-acoustic music and modern dance explored interactivity of disciplines and technologies by allowing dancers' movements to control electronic music and robotic lighting by way of a touch-sensitive computer dance floor.

President Robert M. Berdahl opened the conference quoting a Chinese proverb: "I hear and I forget. I see and I remember. I do and I understand." Berdahl praised the research experience as the most practical and potent method to provide students the perspective of inquiry, innovation and exploration as they prepare "for a future that is not so much known to be uncertain, but instead, certainly unknown." That facts and methodologies become obsolete in a world in which developments and advances occur with dizzying rapidity points to the importance of incorporating research activity into the undergraduate experience.

Dr. Berdahl also praised the student-faculty relationships that are fostered by the research process, congratulating the faculty mentor for serving the educational needs of the talented and motivated students by participating in the adventure of exploration and discovery, of cooperation and collaboration which characterize academic life.

Five distinguished plenary speakers addressed conference participants throughout the three days. Dr. Steven Weinberg, Nobel laureate in physics and professor at the University of Texas at Austin, challenged listeners to consider the future of science by posing the questions "The End of Science?". Dr. Robert Williams, Director of the Space Telescope Science Institute, dazzled the audience with the most recent images from the Hubble Space Telescope. From the vastness of space to the minute complexity of genetic research, Dr. Steven McKnight of the UT Southwestern Medical Center at Dallas introduced conference participants to the fascinating work being done in gene regulation and cell differentiation. Friday night's fete "Texas Culture Swing" featured, in addition to an outstanding sampler of culinary and musical styles of the Lone Star state, a mini-plenary address on the multifaceted aspect of Texas border cultures by Dr. Rolando Hinojosa-Smith, distinguished author and professor of Creative Writing. NCUR 97 closed with a resounding standing ovation upon conclusion of "The Challenge of Leadership" by Sarah Weddington, J.D., former Texas legislator and White House assistant, now author, lecturer and adjunct professor.

The University of Texas at Austin is proud of the privilege to share our campus for these few days with the distinguished group of students and faculty whose work is presented here in published form. We congratulate you for your accomplishments and encourage you to continue to participate in the challenge of research.

Susan Wells Howard, Chair, NCUR '97

PREFACE

The 407 papers published in these five volumes are representative of the approximately 1825 papers and posters presented at the celebration of undergraduate research that was NCUR '97'. The faculty, staff and students of the University of Texas at Austin are to be commended for making NCUR '97' such an enriching experience. The student authors deserve recognition for their hard work and for their persistence in seeing their research through to its final publication.

Special thanks are extended to Dr. Susan Howard, Ms. Kelly Johnson and other members of the NCUR '97' staff. Their help during the days of the Conference was invaluable. Many thanks also to the members of the National Board, who reviewed a large number of papers submitted to the Proceedings under time constraints. Their continued efforts to standardize has raised the Proceedings quality. This project would have not been successful without their assistance.

I would also like to thank the UNCA Editorial Board, who put in many long hours reviewing, checking and organizing papers, and Tracy Walker, and Adam Bradley, who did all the cutting and pasting necessary for these volumes. I owe a special debt of gratitude to Katherine Whatley, Tracy Walker and Mila Cleverdon for their support, encouragement, and mentorship during the entire process of organizing the Proceedings.

To all the students who submitted papers to the Proceedings go thanks for their participation and congratulations for their achievements. Your enthusiasm and achievement will serve as role models for the next group of student researchers - whom we look forward to meeting at the Twelfth National Conference on Undergraduate Research at Salisbury State University, Salisbury Maryland.

Preclassic Maya Pottery From Colha, Belize

Sharon Hankins

Department of Anthropology
University of Texas at Austin
Austin, Texas 78712-1086

Faculty Advisor

Fred Valdez Jr

An analysis of ceramics from the ancient city of Colha, Belize indicates a dramatic change in the social, economic, and political systems of the Maya from ca. 1000 B.C. to A.D. 250. The characterizations of the social systems are reflected in the fragmented ceramics. The analysis of the pottery has provided a means for observing the changes in the social systems over time. Specifically, changes in pottery styles and distribution indicate a more interactive society by A.D. 250.

INTRODUCTION

Colha located in northern Belize, was first investigated by the Corozal Project in 1973(Hammond 1973). Initial survey of the area confirmed the existence of a major chert procuring and manufacturing center. The Colha Project began in 1979, and at the end of the 1986 field season, had generated more than 250,000 pottery sherds, including partial and whole vessels (Valdez 1987). The northern area, near Cobweb Swamp, contains remains of the main ceremonial center(Hester, Shafer, Eaton 1994). The site is sectioned into quadrants, divided by the Northern Highway(Figure 1). The focus of this paper is on the Preclassic ceramic material(1000 B.C.-A.D. 250), which is most significant in the northern quadrant (2000), and the densest in population(Valdez 1987).

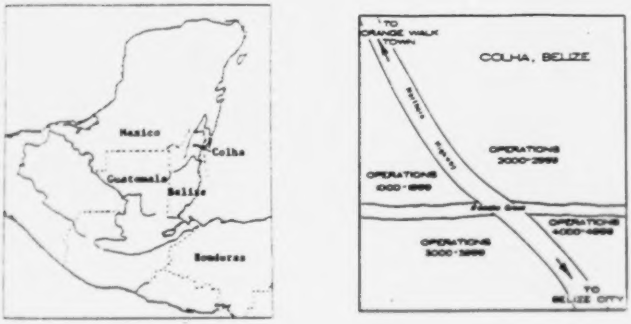

Figure 1 The Colha Archaeological Site and Research Quardrant at Colha

Colha was almost continually occupied from the Middle Preclassic, until the Late Postclassic time period of A.D. 1400(Hester, Shafer, Eaton 1994). The following chart (Figure 2) can be used to compare significant complexes of the surrounding major sites in the Maya area. Please note the inclusion of several other sites with similar sequences.

Adams and Valdez completed the first field season's report, analyzing ceramics in 1979. They used the type-variety system established by Smith, Willey, and Gifford(1960), and Gifford (1976).

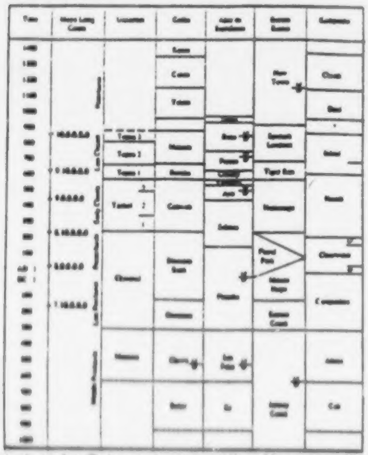

Figure 2 Chronological chart for Colha and several other Maya sites(Meskill 1992)

PURPOSE

The use of ceramics is one of the many tools incorporated by the interdisciplinary field of archaeology to recreate the social behavior and lifestyle of ancient societies. These pottery sherds are remnants of people, with their own particular shared belief and ideological systems that are culturally, socially, and economically integrated. These belief systems enable them to create survival mechanisms- in their unique environmental location.

Ceramic vessels are characteristic of each specific time period reflecting the degree of technological skills, and display societal preferences of style. By examination of pottery forms, we can endeavor to trace communication and exchange with other ancient sites. Using comparative studies, archaeologists can trace trade routes and alliances.

Ceramics can be useful in chronologically dating occupations at ancient sites. Ceramic stratigraphy is based on the concept that the oldest material resides under the younger(or more recent). It is one of the more important methods employed to date material in the archaeological record. Comparison with similar materials from other sites can help to secure time frames, and reference communication between various locations.

GENERAL HISTORY OF THE MAYA

The first occupants of the Maya lowlands were opportunists. They roamed the plentiful river ways taking advantage of the terrain. Their needs were met as long as environmental opportunities were available. However, as their numbers increased, the practice of exploiting their own specific economic niche became more advantageous.

Pottery made of durable and accessible clay, rather than lighter and perishable materials, such as straw and gourds, became more practical at this time. Simple utilitarian wares became more visible. Concentrating on exploiting their surroundings, the Maya could now, manipulate their unique resources to satisfy the desires of the complex lifestyle they created.

Utilitarian vessels may have become a necessity for preserving surplus crops. Ceramics were beneficial in transportation and storage of the most desirable of all resources--water.

BOLAY COMPLEX (1000-600B.C.)

By the Middle Preclassic, the simple agriculturists of Colha had exhibited a similar complex of ceramics with their contemporaries at Cuello, Santa Rita, Kichpanha, and San Estevan. Red monochrome ceramics are representative of the southern Maya lowlands at this time Period. Forms that comprise the Bolay complex are utilitarian bowls, dishes, and plates(Valdez 1987).

Two of the most important groups introduced in the Bolay complex are Consejo Red and Ramgoat Red. A "proto" dichrome may have been created by the introduction of Consejo Red with the application of a red slip over a white or cream base(Valdez 1987). Decoration is represented by pre-slip groove incision.

Fragments of Chicago Orange jars display direct rims and round or square lips on out flaring necks. These jars may have cylinder loop handles or slab handles "incised to give the appearance of loops"(Valdez 1987).

Some of the earliest burials excavated at Colha are from Op. 2031, comprised of several house platforms. Three distinctive Bolay vessels were found. One was a Ramgoat Red placed on the head of a juvenile. Another discovery was a Conejo Red vessel, contemporaneous with Ramgoat Red, placed over the skull of an adult male. Associated with this burial were shell beads, and a small jade celt(Hester, Shafer, and Eaton 1994).

A censer (with burn marks), the Bolay "fat man"(Figure 3) is one of the more unusual artifacts in this context. There may be some similarity between this Ramgoat Red modeled human figure and the pot-bellied boulder carvings of Kaminaljuyu dated at 500 B C (Adams 1977) However the Bolay complex dated 1000-600 B C . is earlier than the numerous boulder carvings of Pacific Guatemala

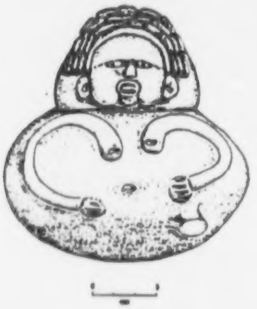

Figure 3 Bolay "Fat Man" Censer(Courtesy of the Colha Project)

Op 2012 and 2031 render other diagnostic sherds For example one type is Tapalo Red-and-Cream of the Bolay complex which developed chronologically into the later Muxanal Red-and-Cream of the Chiwa Complex The Xe sphere at Altar de Sacrificios Seibal and Tikal share similar types Thus, we can begin to see specific changes through time and communication or exchange over long distances

A lack of specific resemblance or replication of certain attributes in the Maya lowland may indicate regionalism in the early Middle Preclassic Perhaps access to other ideas(templates) or lack of need for outside resource, in this time period, allowed for regional expression, and more creative differences could be explored locally

CHIWA COMPLEX(600-300B C)

Joventud Red monopolizes the majority of the Chiwa Complex Joventud is an extension of the Ramgoat Red of the Bolay Complex Joventud is dark red not fire-clouded, with crackling or fire-crazing observable A definite "waxy" red slip is developed in the later facet of the Chiwa Complex Dichromes of red-on-cream are a direct reflection of the Bolay Complex, as well Pre-slip incising and grooved horizontal line is prominent at this time The complexes at Altar de Sacrificios Seibal, Tikal Uaxactun, Becan, Cuello(late facet) and many of the Maya lowlands share similarities with the Chiwa Complex, and belong to the Mamom Sphere(Valdez 1987)

Tecomates (neck-less jars) are introduced in the early facet of the Chiwa Complex This diagnostic vessel is not identified in the previous complex at Colha, and not represented after the conclusion of the late Chiwa Complex(Valdez 1987) Spouted vessels sometimes called "chocolate pots" are another new form introduced at this time They appear in the late Chiwa Complex, as both red and black slipped jars (Valdez 1987)

As noted above regionalism is still reflected with the use of a few unique vessels However by the late facet of the Chiwa there is a distinct homogeneity that developed throughout the Maya lowlands

ONECIMO COMPLEX(300-100B C)

Sierra Red is the predominate type found in this complex Again, there is a definite correlation established between the complexes An exact distinction between Jovetud Red and Sierra Red is convoluted at best in the early facet Society Hall another diagnostic red slip exhibits a "streaky" finish due to a probable method of wiping the red slip over the vessel(Valdez 1987)

Found as a cache and defined in the Onecimo/Blossom Bank Complex are two Sierra Red bowls found lip to lip at Op 2012 by Potter There is post-slip, post-fire inciaing on the interiors of both vessels The designs are unique and debatable but evidence of hieroglyphic writing is conceivable Laguna Verde incised is the type name given(Valdez 1987) Kichpanha also has evidence of writing at this time with form of an ancient bone(Gibson Shaw and Finamore 1986)

BLOSSOM BANK(100B C -A D 250)

This Late Preclassic period follows the Onecimo Complex and is somewhat comparable to the Floral Park of Barton Ramie The Blossom Bank Complex is a continuum of the elaborate techniques of the earlier Complex but is composed of ceramics that are definitive of this time period Although associated with Floral Park of Barton Ramie the ceramics of Colha have an expressed degree of technology and decoration beginning to expand in the preceding Onecimo Complex

Slips that are hard and glossy-- bichromes, trichromes polychromes and mammiform feet are all examples of the achievements of this Late Preclassic site(Figure 4) Decorative styles include geometric patterns and an increase in resist design

BEST COPY AVAILABLE

Included in this complex are several unique vessels, and sherds that were recovered from Op. 2012. Seven sherds with tan to buff paste display specular hematite(maroon) rim bands, with another brown horizontal band below the rim oh the exterior. Usulautan decoration is found on two sherds with straight to wavy lines of brown or black.

Ixcanrio Orange-polychrome is a diagnostic type. The bowl form is decorated with an orange-red slip and has a red and black geometric design. The vessel type is often supported by distinctive hollow mammiforin feet. Unnamed Positive Painted is another inclusive vessel with painted red stripes down the interior on a light orange base (Valdez 1987).

All of these spectacular vessels, with such elaborate techniques help establish the Late Preclassic, also known as the Protoclassic. These attributes usually associated with the Classic, are firmly entrenched in the Blossom Bank Complex, at Colha.

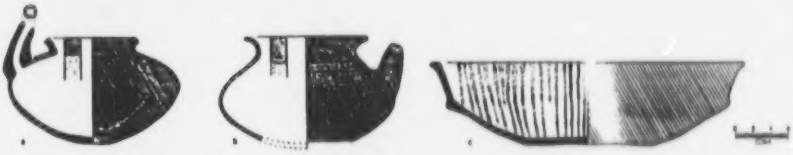

Figure 4. Late Preclassic Pottery from Colha(a and b are spouted jars, c is a positive- painted bowl)

SUMMARY

The first interest in Colha was generated by the realization that this ancient site was once a major lithic production center. Midden samples revealed a society very familiar with the importance of their surroundings, and the knowledge of how to manipulate it. Colha was surrounded by swamps and riverways. Agriculture, which could be supported by this environment, combined with possible trade paths to other sites, may have assisted in forming alliances between Colha and neighboring centers. Manufacture of trade items and their distribution would require supervisory positions. Control of water resources, and agricultural logistics are other operational problems created by interactions of different technological segments of society.

Management of these resources would require some means of recording. The discovery of the hieroglyphic type writing with the Late Preclassic Sierra Red bowls at Colha may indicate these ancient people possessed the capabilities to initiate this major accomplishment. Colha's neighbor, Kichpanha, also, possesses a inscriptive writing at the same time period.

By comparitive studies of the ceramics of Colha and the northern Belize region, the interaction of these sites in the Preclassic may enable a better understanding of the social changes that occurred. Preclassic ceramic evidence supports continuous occupation of Colha from 1000 B.C. to A.D. 250. Each complex exhibits vessels that denote influence from other other sites in Belize, Guatemala, and much of the southern Maya lowlands. However, Colha continues to produce vessels that are particular to its own location. Perhaps, this conveys stability in the functioning of society. There is no evidence of another group or region exhibiting control over the ceramic production in the Preclassic period.

Ceramics associated with burials were evident from the beginning of the Bolay complex, and continued with the mortuary evidence in Chiwa, Onecimo, and Blossom Blank. The burials included ritualistic items such as the Bolay "fat man" censer, modeled bottles, and unique effigy vessels. Special attention and prestigious objects separate individuals and their possessions. This distinctive occurrence expresses the qualifications of a stratified society, especially with the inclusions of particular objects that indicate significant concentrations of wealth. Objects that occur in a ceremonial atmosphere may represent a segment of society that has higher status over the rest. It is important to observe that the ceremonial features do not only imply reverence to a specific individual or ruler. There is also indication of attention to familial or ancestral association.

CONCLUSION

Preclassic Colha utilized their assets to transform their existence into a major center. Contacts with their neighbors extended their influence into Guatemala, northern Belize, and much of the Maya lowlands.

Ceramic analysis illustrates contact with major centers. Trade items, jade, shells, elaborate goods, coupled with ceremonial artifacts reflect a more stratified society over time. An early form of writing is already in place by the Blossom Blank Complex(100 B.C. - A.D. 250). Colha was producing an inventory of sophisticated ceramics usually attributed to the Classic Period reflecting a more complicated and hierarchial society by the close of the Preclassic in A.D. 250.

DECIPHERING THE SECRETS OF SKELETAL REMAINS FROM HELLENISTIC ABDERA, GREECE

Thomas P. Bolioli and Tara M. Kirkpatrick

Department of Anthropology
1 South Ave
Adelphi University
Garden City, NY 11530

Faculty Advisor:

Dr. Anagnosti P. Agelarakis

This research project conducted in-depth interdisciplinary analyses of physical anthropological and forensic nature concerning a Hellenistic skeletal collection from the city of Abdera, located in coastal Thrace of northern Greece. It was proposed that such a study would provide pertinent information elucidating undocumented aspects of the human condition in antiquity. The collection comprises 45 individuals which were excavated and documented in the field by a previous team of researchers in 1993, and represents a random sample of the 4th-century B.C./B.C.E. population of Abdera. Assessments in skeletal biology, paleopathology, and trauma had been conducted in the field.

Laboratory evaluations and computer tabulations of the existing anthropological records, carrying statistical implications on a population-environmental approach, focused on interrelations between skeletal "Markers of Habitual and Occupational Stress" (MHOS), permanent markers recorded on human osseous surfaces, and the organizational capacities of this population. Specific skeletal characteristics unique to this population were revealed which are indicative of their techno-economic abilities and certain patterned behaviors which traditional archaeology has had limited potential to discover on its own. These research results are of significance to anthropologists, archaeologists and historians in their efforts to better perceive and understand facets of the living conditions of the citizens in Hellenistic Abdera.

INTRODUCTION

Archaeo-Anthropology, specifically skeletal biology and paleopathology play a significant role in deciphering aspects of the human condition in the past. Rarely does the Physical Anthropologist bask in the riches and ruins of discovered ancient civilizations. Instead, the Physical Anthropologists' temple are the human skeletal collections, and their hieroglyphics are the muscular imprints and wear patterns on the osseous white walls. Their most precious metal is not gold or silver but copper, because its oxidation preserves organic tissues for chemical analysis. The riddles and secrets Physical/Forensic Anthropology attempt to solve, concern the daily life of individuals within larger groups, not only what types of tools a person or persons used but also how they used them.

This paper presets aspects of an ongoing Archaeological project run by the Greek Archaeological Service in Thrace in collaboration with Dr. A. Agelarakis of Adelphi University. The excavation relevant to this discussion was carried out in 1993-94 in an archaeological site of a town called Abdera located in the Thracian region of Northeastern Greece. The skeletal collection dates to the 4th century B.C./B.C.E. in what is commonly referred to as the Hellenistic period. This paper will provide a general inventory of the pathologies and significant skeletal characteristics unique to this population. These

429

findings will ultimately be used in conjunction with the archaeological record, historical record, and known cultural history of the area to elucidate aspects of the daily life of this population.

Abdera is presently locate. 6 Km from the coast and is surrounded by mountainous, wooded areas and open fields, which today are used for farming. Today Abdera is a fraction of what it once was. Its mythological name comes from Abderus, friend of Hercules, who was killed by Diomedes horses in that area. Its historical origins are equally as fascinating, as it became an established city in the 7th century B.C./B.C.E. founded by Timesius of Clazomenae (Herodotus Clio I. 168 p.73). In its peak, the city stretched from its present day location 6 Km south to the Agean Sea. The city was home to Democritus, Protagoras, and Anaxarchos, the counselor of Alexander the Great. Xerxes along with his army of approximately 2.5 million military personal and over a million pack animals inhabited the city. The society was agriculturalist and as well as pastoral and the products produced by the city were maize and wheat. With its marble streets and public fountains made of solid gold and fine stone Abdera became the third richest city during the Delean League (Agelarakis, Personal Communication). There were two harbors, one for commercial use and the other used solely for military purposes, both of which were the site of many historical events (ibid). Yet, by the Hellenistic time period in which this particular excavation was focused, the historical record states that the city of Abdera is in a predominant state of continuing success.

Despite the multitude of historical and archaeological data some aspects of the past remain unclear. One of these aspects revolves around the details surrounding the lives of Abdera's inhabitants and an overall picture of what daily life was like on these people's physical bodies.

METHODS

The physical anthropological and paleo-pathological data relevant to this skeletal population had been gathered by extensive laboratory studies by a previous team of researchers in 1993-94, headed by Dr. A. Agelarakis of Adelphi University. These records (Agelarakis in manuscript) were developed in and around an excavation of a necropolis just outside the walls of the ancient city of Abdera and consisted of a collection of systematic notes written to uniform lab sheets. Each lab sheet represented information on single or multiple burials and relevant information on certain criteria. These lab sheets provided information in reference to skeletal biology, morphology, epigenetic variation, the identification and distribution of disease entities, trauma, and other permanent skeletal markers concerning this skeletal population. This included cranial, dental and post cranial measurements, a description of the skeletal remains, tentative age and sex assessments, dental observations, and any skeletal pathologies, Markers of Habitual and Occupational Stress (MHOS) (Agelarakis 1993), suspicion of trauma, and epigenetic variation. Approximately 60-70% of lab reports contained additional documentation making inferences, through illustrations, of skeletal surfaces containing emphasized muscular attachments.

The information obtained from these lab sheets was broken down into individual components and entered into a computer database. Doing so allowed for easy and efficient data manipulation and examination. The database was used to run queries isolating certain individuals that fit any number of specified criteria, defining relationships and highlighting significant occurrences of pathologies, or MHOS within the skeletal record. Aspects of this data were converted into more easily manageable forms, with emphasis on the MHOS. Each known MHOS (Kennedy, 1989) had been assigned by Dr. Agelarakis in 1994 sequential numerical designations for purpose of simplification of descriptions of such anatomical loci on all skeletal structures (Agelarakis, 1994) and is presented below as such (ie: Phalanges #1 represents a specific MHOS).

With this information interest was centered on the interrelations between MHOS, pathologies and trauma, and the implications this had in determining the relationship of the represented individual and the social and physical aspects of their environment.

RESULTS

SEX/AGE

The following is a chart detailing the age/sex disbursement of the represented population.

	Males	Females	Indeterminate
Sub-Adult (16-19)	0	0	3
Young-Adult (19-25)	3	3	1
Middle-Adult (25-35)	7	10	0
Late-Adult (35-45)	9	3	0
Maturus (45-55/60)	0	1	0
Senilus (55/60+)	1	1	0
Indeterminate Age	0	0	3

MHOS

Of the 45 individuals represented, 32 had revealed characteristic manifestations considered as skeletal traces of MHOS while there were no cases of MHOS in the skeletons with an indeterminate sex assessment. The absence of MHOS on some of these individuals is most likely due to incomplete or fragmentary skeletal remains. MHOS are skeletal manifestations which result from the use of specific muscles, or combinations of muscles, which locally stimulate the osteoblastic activities of the periosteum and the cortical bone surfaces (Agelarakis, personal communication). MHOS can also be seen in skeletal joint surfaces through the of afflictions of osteoarthritis and osteoarthritic based symptoms. The study of MHOS on osseous surfaces can aid in the interpretation of daily habitual and occupational activities including aspects of their socio-political, and economic circumstances (Agelarakis, personal communication).

Some specific markers appearing in the skeletal record are more prominent than others, the most dramatic prevalence of MHOS was observed among both male and female skeletal groups. This was designated Phalanges #1 and occurred in 7 males and 6 females. The MHOS Phalanges #1 is seen when the phalanges, or the fingers, exhibit emphasized flexor muscle attachments along the palm side, between the first and second joints. This condition is suggestive of flexing or grasping objects with the hand (Kennedy 1989). A number of actions could be inferred, all involving the action of grasping in similar ways. In pastoral and farming societies, this can be seen on individuals who milk domesticates on a routine basis throughout most of the year (Agelarakis, unpublished ethnographic work at Abdera).

Apart from this particular example, there are many cases of statistically significant MHOS in this skeletal record that reflect sexual dimorphism. A higher occurrence of these skeletal markers appears in the assessed male skeletons verses the females. This is significant in its indication of a division of labor between males and females in at least some of the more prevalent habitual and/or occupational activities partaken during any given day of these people's lives. The following MHOS markers are illustrative of this in particular, and at the same time have displayed significance by appearing alongside other related markers and/or skeletal pathologies in the skeletal record creating relevant combinations.

Out of the male population, 7 individuals were classified with MHOS Femur #4, more commonly named Poirer's Facet. This marker is observed on the femoral head and neck where bone mass from the articular surface of the head begins to extend distally towards the neck of the femur (Kennedy 1989). This condition is caused by flexing the knee in conjunction with extending the hip up towards the chest. Commonly this action is from squatting repeatedly and/or for long periods of time (IBID).

The calcanei have three statistically significant skeletal markers which occur in this population, classified here as Calcaneus #'s 1, 2 and 3. Calcaneus #1 is an exostosis, or bony build-up located at the insertion point of the Achilles tendon and can be indicative of long distance running, especially on hard surfaces, as well as being commonly found on the skeletons of obese females (IBID). There were 4 males and 1 female observed with this affliction. Calcaneus #2 is characterized by exostoses and small fractures associated with repeated sharp impacts with the ground. This can be associated with the riding and dismounting of a horse. Again there were 4 males and 1 female exhibiting these characteristics. Calcaneus #3, represented by 5 males and 3 females, is characterized by bursitis and a bony spur caused by walking on hard pavements. In this skeletal collection there are 2 male individuals who display evidence of all three Calcanea MHOS and 2 males who show Calcaneus #'s 1 and 3 (Agelarakis in manuscript).

Another prevalent MHOS, a marker classified as MHOS Humerus #3, appears dominant in the male population. It is seen in 5 male individuals, but is non-existent in the female population. This is seen as osteophytic growth on the medial epicondyle caused by the hyperactivity of the flexor muscles throughout the arm (Kennedy 1989). This MHOS trait is observed in individuals who regularly throw javelins or in more modern times play golf (IBID). Also present on the upper extremities is a marker classified here as Ulna #1, which occurred in 7 males and 3 females. This marker is indicative of the flexing and subsequent hyperextension of the arm, again similar to the action of javelin or spear throwing (IBID). Also present, but in less significant percentages, is a marker classified here as Scapula #3 which is osteoarthritis of the glenoid cavity or otherwise the location where the rotator cuff attaches to the shoulder. Overall men have 7 instances combined of the four types of Scapula MHOS, Scapula #1-3 which are osteoarthritis of the shoulder and Scapula #4 is due to a tearing of the rotator cuff, while women have only one instance of either Scapula MHOS (Agelarakis 1994).

Significant MHOS appear in the claviculae of a number of individuals. The marker classified here as Clavicle #1 is the emphasized robusticity of the clavicle end where it attaches to the second rib (Kennedy 1989). This robusticity also occurs on the second rib. The causative agent of this skeletal affliction is force applied in a downward direction onto the lateral end of the clavicle and rib 2, possibly as a result of carrying heavy loads such as pails of liquid. The marker classified as Clavicle #2 is the robusticity of the sternoclavicular joint surfaces. This also includes minute bone fragments ossified together into a dense fibrous wedge replacing the fibro-cartilaginous tissue attachments (Kennedy 1989). This is caused by the same force seen in Clavicle #1 as well as force applied in a backwards direction. Markers Clavicle #1 and Clavicle #2 have important implications in the skeletal record in that they represent a clear case of sexual dimorphism. Clavicle #1 occurs in 4 males and 3 females while Clavicle #2 occurs in 5 males and no females. There are three instances where both are present in the same individual (Agelarakis 1994).

Osteoarthritis

In relation to the MHOS found in the clavicle, there are two cases of eburnation. Both instances occur in males; one found in the age sub-group Late-adult, and the other in Maturus. Eburnation indicates an advanced stage of osteoarthritic activity (post-arthritic condition) where the loss of cartilaginous matter in the joint cavity causes the remodeling of the articular bone surface. This remodeling is the result of bone on bone contact which leads to the bone becoming denser and in some cases even polished (Schwartz 1995). Both cases exhibit the emphasized muscular attachment in correlation with the MHOS Clavicle #2 as well as traces of inflammatory processes and severe osteoarthritic activity in these areas. In one individual there is the evidence of a healed fracture which could be indicitive of the arthritic condition being trauma related (Agelarakis 1994).

In these areas of increased stress, there are vestiges of inflammatory processes. Osteoarthritis (OA) occurs in synovial joints containing synovial lining and fluid or basically all joints with socket formations. OA is an inflammatory disease affecting the cartilaginous contents of the joint cavity, constituting habitual exertion involving the specified joint. Manifestations of this, seen in the skeletal record, become evident at approximately 35 years of age. Aspects of this can present themselves as porosity on or around the affected area; osteophytes may be present as small bone growths on the specified articular surface and an affliction known as lipping forms along the edges of the articular surface surrounding the area of destruction (Schwartz 1995). Also apparent, are Spondyloarthropathies: osteoarthropathic conditions occurring specifically in vertebral bodies.

Of the skeletal record, 80% exhibited symptoms of OA; 43% bore indications of spondyloarthropathies. There are eight individuals who did not exhibit characteristics of

BEST COPY AVAILABLE

these types of OA. Two of these were under the age of 18, five individuals could be found between the ages of 18 and 25, and one individual was placed in the age sub-group, Late-Adults (35-45 years of age). The majority of these aforementioned specimens were in fragmentary condition when excavated. Because of this poor preservation, it is possible that epiphyseal ends (where OA can be detected) were incomplete, or missing all together.

Despite this, OA characteristics are well dispersed throughout this population. Sixteen percent of the individuals who exhibited symptoms of OA displayed traces of osteophytic growth and 89% exhibited evidence of lipping. These characteristics were found in individuals beginning in the age sub-group, Sub-adult (16/17-18/19 yrs. of age).

There are six cases where characteristics of OA appear in relatively young individuals, three of which are especially unique because of other pathologies involved. Two of these three individuals were assessed to be female, belonging in the age sub-group Sub-Adult, and the third, a male, was placed in the Young-Adult group. The first female had pronounced muscular attachments in the lower extremities. Osteoarthritic characteristics for that individual included porosity and lipping in areas of the metatarsals and the phalanges of the manus (specifically the thumb). The second female exhibited lipping in the acetabulum as well as spondyloarthropathies expressed as osteophytes and lipping. These signs of OA and spondyloarthropathies in this second female could be characterized as traumatic arthritis, due to a traumatic event evidenced by a Schmörl's node. A Schmörl's node is an indentation present in the body or the spongy bone of the vertebra (Schwartz 1995). These herniations are caused by impaction of the spine from actions such as jumping off a horse or off walls (Agelarakis personal communication). The third individual, a male, had traces of Spondylo-arthritis manifested as osteophytes, as well as a range of osteo-arthritic activity occurring in all areas of the skeleton. In these cases many areas affected by OA had correlating MHOS. For example MHOS Clavicle #1, #2 and #3 as well as MHOS Scapula #1 and #3 were consistent with significant porosity and lipping in the same areas.

Trauma

In this sample, there were 8 male and 2 female individuals that exhibited overt incidences of trauma, spread almost equally throughout all age sub-groups. These ten incidences are as follows: two located on the skull cap; one well healed fracture on the clavicle; one pulled M. pectoralis major at the location where it attaches to the humerus; a stress fracture on the ulna; and five incidences of trauma on the lower extremities. The five incidences of trauma on the lower extremities are as follows: two are healed fractures in the tibia; two show examples of an ossified hematoma; and one shows a split in the tibia containing a cloaca, or a drainage area in the middle of the split.

The prevelence of these traumatic incidences becomes increasingly significant with the unusually high appearance of periostitis throughout the population (Agelarakis in manuscript). Of the twenty-two percent affected by this condition, six are male and four are female. Periostitis is the inflammation of the periosteum, or the outermost surface of the bone, which in the process of healing creates an interwoven buildup of osseous material over the affected area (Schwartz 1995). This is seen in the skeletal record as a disturbance on the normal surface of the bone by this reaction site having a porous or even lamellar appearance (IBID).

From the examination of this skeletal record, it was postulated that periostitis was influenced in two specific ways. One possible cause was physical trauma to the affected bone surface. Periostitis can be a long term reaction caused by repeated trauma to areas such as the limbs. For example, horseback riding through dense brush (Agelarakis, personal communication). The other cause was the infiltration of bacterial manifestations through the epiderm, contributing to infection. These infiltrations can be induced by traumatic events, specifically wounds. There are other causes of periostitis, inclusive of secondary periostitis, that can range from general bacterial infections to specific diseases, however they are usually supported by other evidence. Most of these causes were ruled out due to the lack of this supporting evidence. There were certain cases in this study that appear to be secondary based on the location of the reaction. Nonetheless, there are more cases where the reaction occurred on bone surfaces that would be susceptible to external trauma since the bone is located close to skin surfaces with little protection provided by soft tissue. These cases occur in the tibiae, fibulae and on the ulnae.

DISCUSSION/CONCLUSION

This paper has illustrated aspects of daily life in Abdera through in-depth analysis and research of a random sample of the skeletal remains of its inhabitants. Despite the wealth of this city, even at this time in history, there is a great deal of evidence that life was physically demanding for these people. This can be seen in the fact that OA, sometimes even the most severe cases, was found in relatively young individuals as well as the fact that the OA found in this skeletal population statistically correlates with particular MHOS factors. Incidences of trauma in conjunction with observed periostitis support this conclusion as well.

There seems to be a division of labor between males and females however the women of this city led by no means a sheltered existence. It appears that much of the physical labor was spread equally throughout the population, however each gender group appears to have been designated different tasks as well as possibly partaking in some shared activities.

All this is not to say that the inhabitants of Hellenistic Abdera were slaves to the land, attempting to scratch out an existence on this earth while living in a constant struggle for survival. Based on the skeletal record, these people were healthy, hard working individuals who were receiving adequate nourishment and proper health-care. Furthermore some of the MHOS that is recorded can also be caused by extracurricular activities such as sports and other recreational past-times which the historical record has shown existing in this time period. By examining the historical, archaeological, and skeletal biological data one gets the distinct impression that this population led rich full lives through strong cultural and physical ties with the land.

ACKNOWLDGEMENTS

We would like to extend our warmest thanks to Dr. Agelarakis, our advisor and mentor, who has gone beyond all limitations placed on him to make projects such as this attainable by undergraduates. His patience and concern were pivotal in our research efforts. In addition we would like to thank Dr. Lund for his technical assistance in the preparation of our slide presentation. Finally, we would like to thank Dean Hactoun for his encouragement and support throughout our project and in attending the NCUR conference.

BACKGROUND

A characteristic of Japanese women's participation in the labor market by age is a strong M-shape curve: Japanese women's labor participation keeps increasing until approximately age 20 to 24; then, the ratio of participation decreases rapidly until women reach the ages of 35 to 40; at that point, the ratio again increases until ages 50 to 54; and finally, the women's participation in the labor market decreases again after the second peak (Takenaka, 1989; Brinton, 1993; Takahashi, 1994; Yoshizumi, 1995; Sugimoto, 1997). This phenomenon is primarily caused by a temporary retirement from the labor market for motherhood and child rearing, which is strongly embedded as a gender role and identity for women in Japanese society and culture. However, this M-shape curve does not explain the women who do not retire from the labor market despite their motherhood duties, but it emphasizes the impact of traditional gender roles. Therefore, it is important to gain insight into women who do not retire from the market in order to comprehend the range of concept of Japanese women.

I focused on women working in small family businesses without pay; particularly in family businesses operated solely by a husband and wife. These businesses are typically the bottom of the subcontract system--the system of business networks consisting of a core firm and its allied satellite firms (Gerlach, 1992). Each satellite firm makes goods to order only when the core firm demands, and the core firm controls the amount and price of goods. The subcontract firms are dependent on their core firm orders, and they have subordinates who are similarly controlled and dependent on them. Therefore, the smaller a firm, the more unstable its business situation. The middle- and small-size firms make up the bottom of Japan's economic system (Ueda, 1989).

There are two significant points to highlight in this group of people. First, scholars have focused on the young women in textile mills and in agriculture partially because they know that the women's role as cheap labor is a key for industrial development in any country (Hunter, 1993). Second, there are no precise historical records of how the women working in their family business lived under Japan's rapid economic growth in the post World War II years. Those women did not have a conscious concept of themselves as laborers and therefore did not form labor organizations (Ueda, 1989).

My interest in these women arose due to my own experience of witnessing my mother and women in my neighborhood who worked hard in their husband's businesses as well as performing domestic work without retiring from the labor market. They usually did the same work as their husbands, typically, physical work such as construction. Based on these observations, my specific research question is: besides economic reasons, what makes those women perform their three roles (wife, mother, and worker) without being paid.

DATA COLLECTION

The women in my research were in Osaka, Japan. I designed a survey consisting of open-ended questions mainly. Thirty nine women (ranging in age from 31 to 78) answered the survey. The types of businesses they worked in were construction, ironworks, painting, lumber processing, and grocery or liquor retail. Then, I selected 5 women at random (their ages were: 33; 48; 54; 61; and 63) from those who answered the survey, and each of whom agreed to be interviewed. I interviewed them more than 5 times per person (around 30 minute- to 2 hour-interview at one time) from September through December in 1996.

DATA ANALYSIS

In the process of both working in the businesses and in the home, the women fulfill the identities required by pre-existing social and cultural structures. What I mean by "pre-existing social and cultural structures" is any external sanctions that impose "identities" on us. In other words, external sanctions exist prior to "self" and assign "identities" to us or affect those identities by our experiences and expectations from society and culture. Even if we come into conflict with one (or all) of the "identities" given by the pre-existing social and cultural structures, our cognition of identification of "self" can not react to the pre-existing structures without being influenced by those very structures. The cognition of identity itself is conveyed by the structures, which affect the way in which we conceive ourselves.

There are two kinds of external sanctions: one is abstract or conceptual sanctions, which we practice unconsciously. We call this in general, "culture." The other is conspicuous and explicit sanctions, which we practice consciously, such as legislation, political formulations and economic systems. I will take finances as an example of the two kinds of external sanctions in order to explicate the correlation between the pre-existing social and cultural structures and identities. According to the literature on Japanese families, family finance management is the wife's task in general. The relationship between a wife and a husband in terms of finance management is the relationship of a wage-earner and his partner. Wives receive their husbands' salary and make plans for its usage, even determining how much spending money the husband will receive. Yet they have no right to manage large amounts of money like negotiating house loans. Usually, husbands make the decisions for the immense funds. A wife is the head of the family in terms of house care, whereas a husband is the decision maker for major money management (Long, 1987; Okura-sho Insatsu kyoku, 1987; Roberts, 1994).

According to my data, the same functions in the women's families of my research. Their husbands manage the business funds, while the women manage the family budget. The women working in their husband's family business accept this general role, conceive of it as natural, and conclude that this is a part of their role as "wife," i.e., the women unconsciously identify themselves as a "wife" by exercising this implicit cultural or social practice.

The legal paper work for funding such as applications for funding from banks is a pragmatic and explicit sanction. Since the papers require the signature and *hanko inkan* (stamps of name--usually family name) of the household (most cases are males), the women working in their family businesses typically must ask their husband for his signature and *hanko inkan*. This inability to sign the document enhances the women's consciousness that they are culturally seen as subsidiaries of their husbands, for they can't subscribe their name to the document. In other words, the document makes them recognize that they are neither the householder nor a proprietor of the business by not subscribing their name. Hence they train or cultivate their identity as a wife of the householder or the proprietor. The women in their family businesses discipline their identity as wife by exercising both the explicit and implicit structures/sanctions.

However, the women's identity is not always the same: identity is changing, according to what kind of pre-existing social and cultural structures the women encounter and how they react to the structures. Their identity changes tremendously from wife to mother, usually after they deliver their first child, though this doesn't mean they lose their previous identity. The women typically identify themselves as mother rather than wife when they have to select either identity. Thirty seven women who answered the survey wrote that children were their *ikigai* (whole life) or *takaramono* (precious things) and they felt strongly that they were mothers rather than wives. Some of the informants said that their husbands were like air, i.e., they needed it to live but it was too natural to have it with them to consider it as an important thing. This phenomena occurs partially because these women follow the pre-existing cultural structure, in which womanhood includes the gender roles in family (a father is an economic sustainer of the household, while a mother is a caretaker of the household). In short, once the women have children, they perform the part of womanhood more than before, paying attention to their children. So, they define themselves as mother rather than wife.

In the beginning of their marriages, the women working in their family business did not expect that they would help their husband's business. Yet they started working because of the cultural norm that a wife is *en no shita no chikaramochi* (a hidden helper) of her husband: they were expected to work without being paid. However, they did not stop working even when they did not have to help the business, because they had already established the identity, worker, by performing the way of the pre-existing cultural structure. In this point, their identity is no longer the extended role of the other two identities, wife and mother as *en no shita no chikaramochi*, but an independent identity from the other two.

Although the women working in their family businesses accept the identities assigned by the pre-existing social and cultural structures, they sometimes had conflict or dilemmas. Some women felt that they wanted to draw a salary from the family business as a laborer, on the other hand, they did not want to draw a salary because they still had the sense that their labor was part of their extended role of helper for their families. When they confront such a dilemma, they tend to select the latter. This may show that the influence of the pre-existing structure has more impact on them, yet their reactions have been changing gradually, as they incorporate other information which gives them more options to determine their identities.

CONCLUSION

The three identities (wife, mother, and worker) are coexistent in the women working in the family business, and these identities are reconstructed, first, by their perception and reaction to the pre-existing social and cultural structures, and second, by polishing their identities through enacting the roles. These three roles show at different times and situations, depending on how the women perceive and react to the preexisting structures. When the women react to the structure in the way that the norm indicates, they exercise the identity that the structure assigns to them, and they reconstruct/reconfirm the normative identities. However, when the women react to the structure in a different way than the norm indicates, the women usually are incorporating other information that results in a women's new identity or a new connotation of their identity. For example, the identity, "worker." Before, it implied mostly the extended role of wife and mother acting to protect her family, yet it also contains the sense of the laborer who is entitled to wages. As a result of this shift, the women started organizing their labor union.

Identity/identities and self are contradictory and multiple, depending on how we approach the structures and train or cultivate ourselves. Once the women find out that their identities do not always fit the categories precisely, they discipline and construct their identity by following or resisting the norms of the structures. The more they become conscious of the relationship between the self and the structures and its complexity, the more they themselves become inwardly multiple and contradictory because those structures are not always consistent, involving political economic, cultural, and power relations as well as identities and perceptions.

This paper presents significant results of archeo-anthropological research conducted on three human skeletal collections from the Non Pa Wai and Nil Kham Haeng sites in the Khao Wong Prachan Valley of central Thailand, dated from the middle of the 3rd to the middle of the 1st millennia B.C./B.C.E. respectively. These human skeletal remains were excavated by the Thailand Archeometallurgy Project, yielding a total sample size for the three populations of 57 individuals. Methods used for this research project included forensic inspectional techniques (for studying dental morphology and variation, pathology, and dietary patterns for the three populations), and mensurational analyses (for comparative statistical evaluations). Using such procedures, suspected diachronic bio-cultural similarities and differences between the populations were verified. These results provide a "window" into the human condition of these peoples in antiquity--for interested scholars in the social sciences, natural sciences and humanities alike--on two levels. On one level, this project reveals aspects of the biological and paleo-epidemiological conditions, as well as the socio-economic context of each population. On a broader level, it also elucidates facets of the chronological continuum of this region, taking into consideration changes in socio-economic organization, technological capacities of food production, ecology and distribution of diseases, and other relative forces which affected these ancient populations.

INTRODUCTION

Without written records, the responsibility of providing an understanding of ancient populations rests in part in the hands of anthropologists. Using techniques common to a variety of other disciplines, anthropologists retrieve, study, interpret and preserve the cultural remains of earlier peoples, thus slowly creating an ever-widening "window" through which others can observe and examine the human condition in the past. Physical anthropologists play a very important role in this process since they do not study the artifacts that were left behind, but rather they study the actual skeletal remains of the people. This rather unique specialization places physical anthropologists in an equally-unique position to provide relevant information regarding the bio-cultural setting in which our ancestors lived.

As we rapidly approach the 3rd millennium and we ponder the problems which plague our own lives, it is somewhat appropriate to examine populations from as early as the 3rd millennium B.C./B.C.E. to determine aspects of what their lives were like. The Khao Wong Prachan Valley is located in central Thailand, in which the Thailand Archeometallurgy Project located and investigated at least two human settlements, namely the site of Non Pa Wai (NPW), which spans the 3rd to the 1st millennia B.C./B.C.E., and the 1st-millennium B.C./B.C.E. site of Nil Kham Haeng (NKH), only one kilometer southwest of NPW (Pigott, 1989). The evaluation of forensic inspectional and mensurational analyses of human skeletal remains from each site reveals interesting insights into the bio-cultural, paleo-epidemiological, and economic conditions of each site, as well as aspects of the diachronic cultural continuity of the region, during a period of technological changes.

In 1986, the Thailand Archeometallurgy Project (TAP) began its initial investigations in the Khao Wong Prachan Valley under the direction of Dr. Vincent C. Pigott of the University of Pennsylvania Museum. Since both NPW and NKH are located near natural ore deposits, the inhabitants of these sites were amongst the earliest in Southeast Asia to engage in systematic copper and bronze production (and later iron production), and in long-distance trade and exchange of such "luxurious" items. Metallurgical artifacts were also retrieved from human burials from these sites. During the 1986 and 1992 field seasons, human burials were excavated from NPW, and excavations conducted in 1990 uncovered human burials at NKH. The NPW site is comprised of two cultural components which reflect the continuous occupation of the site for almost 2000 years. The earliest component of NPW dates from 2500-1600 B.C./B.C.E.

Because it is the earliest component of the site, it is also the lowest stratigraphic layer, and was therefore excavated in 1992. The later component of NPW was excavated in 1986 and dates from 1600-700 B.C./B.C.E. The NKH site (excavated in 1990) dates from 700-300 B.C./B.C.E. Thus, the three burial groupings/skeletal collections excavated by TAP correspond to stratigraphically-superimposed and temporally-sequential cultural components of the Khao Wong Prachan Valley (Ibid). All human skeletal remains excavated by TAP have been under the direction of Dr. Anagnosti P. Agelarakis, and are currently housed in the Department of Anthropology at Adelphi University.

SAMPLE SIZE AND METHODS

The 1992 excavations of NPW yielded a total of 26 individuals, excavations in 1986 yielded 13 individuals, and the 1990 excavations of NKH yielded a total of 18 individuals. Due to the relatively poor degree of preservation of a number of burials from these sites, the focus of this study turned to dental remains, which tend to preserve better because of their largely inorganic composition (Bass, 1987). The number of individuals with preserved dental remains from the 1992 NPW component is 19 (73%), from the 1986 NPW component is 10 (77%), and from the NKH site is 15 (83.3%). Since approximately three-quarters or more of the individuals of each collection had preserved dentitions, it was determined that dental remains could safely be used as the criterion for representative population samples.

Laboratory analyses of the 1986 NPW and 1990 NKH collections were completed prior to 1996 at Adelphi University (Brower, 1992; Loeb, 1993; Agelarakis, in press). In 1996/1997, the dental remains of the 1992 NPW collection were analyzed for the first time. The dental surfaces were carefully cleaned of soil and/or taphonomic deposits using dental tools and various types of brushes. In the cases where the dental remains were found *ex situ*, they were identified and sorted according to anatomical structure. They were then forensically inspected under low magnification (40-50X) to determine ante-mortem processes of dental eruption and development, morphology, variation, trauma and pathologies, and wear patterns. Age assessments were made according to eruption and developmental stages (Bass, 1987), as well as Brothwell's (1981) occlusal wear classification chart. Various morphological characteristics and pathological manifestations were identified and measured using a sliding caliper and a hand-held monocle with a millimeter scale. Upon completion of the analysis of the 1992 NPW dental remains, the laboratory records of the other two collections were reviewed, and the dental remains were re-examined in a similar fashion to insure the accuracy and compatibility of the data. [Data from the 1986 NPW and NKH collections used in the remainder of this paper refer to Brower (1992), Loeb (1993), and Agelarakis (in press and 1996).]

RESULTS

The nineteen (19) individuals with preserved dentitions found at the 3rd-millennium component of NPW in 1992 represent the full array of age subgroups, ranging in age from neonatal to older than 45 years of age at the time of death. Five (5) individuals belonged to the Middle Adult age subgroup (>25-35 years), which was the most represented age subgroup. Three (3) individuals belonged to the Late Adult age subgroup (>35-45 years) and one (1) belonged to the Middle/Late Adult age subgroup (>30-40 years). Three (3) individuals also belonged to the Infancy I age subgroup (0-6 years), and two (2) individuals belonged to each of the following age subgroups: Infancy II (>6-12 years), Juvenilis/Subadult (>12-18 years), and Young Adult (>18-25 years). Finally, one (1) individual belonged to the Maturus age subgroup (>45-55 years).

A somewhat different demographic profile emerged for the 1st-millennium component of NPW excavated in 1986. Of the ten (10) individuals with preserved dentitions four (4) individuals--the greatest number--belonged to the Infancy I age subgroup, followed by two (2) in the Late Adult age subgroup. One (1) individual belonged to each of the Infancy II, Juvenilis/Subadult, and Young Adult age subgroups, thus revealing some similarities between the two cultural components of NPW. Unlike the 1992 NPW collection, however, only one (1) individual belonged to the Middle Adult age subgroup and there was an absence of individuals belonging to the Maturus age subgroup.

In great contrast to both of the NPW collections, the NKH collection revealed a higher prevalence of subadults and young adults rather than very young and older individuals. Of the fifteen (15) individuals with preserved dentitions, four (4) individuals belonged to the Juvenilis/Subadult age subgroup and another four (4) individuals belonged to the Young Adult age subgroup. Two (2) individuals belonged to each of the Late Adult and Maturus age subgroups. In addition, one (1) individual belonged to each of the Infancy I, Middle Adult and

Middle/Late Adult age subgroups. No individuals were assessed to belong to the Infancy II age subgroup.

Measurements of bucco-lingual and mesio-distal surfaces revealed that virtually all dentitions found in the three collections had larger diameters than contemporary *Homo sapiens sapiens* dentitions (Kraus et al., 1969; Agelarakis, 1996). In addition, greater than 60% of the individuals in the three collections exhibited shovel-shaped incisors. The shovel shape trait is an epigenetic morphological variation which appears with greater prevalence among Asian populations (Tsai et al., 1996). The trait of Carabelli is a trait of non-metric variation expressed in the form of a cusp, tubercle or pit, most frequently appearing on the mesio-palatal surface of the first maxillary molars (Ibid.). This epigenetic manifestation appears in low frequencies among many populations around the world at percentages that range from >4 to ≤20% (Agelarakis, personal communication). In the 1992 NPW collection, 23.5% of the individuals with preserved maxillary molars exhibited Carabelli's trait, as did 30% of the 1986 NPW population, and 33.3% of the NKH population.

Forensic evaluations of the dental remains revealed a number of dental pathologies. Fourteen individuals (73.7%) from the 1992 NPW collection exhibited multiple Linear Enamel Hypoplasias (LEH), as did seven individuals (70%) from the 1986 NPW collection. On the other hand, none of the individuals from NKH exhibited Linear Enamel Hypoplasias. LEH are permanent markers of periodic cessations and subsequent re-activations of enamel production during times of stress (due to illness and/or malnutrition). They appear as distinct grooves in tooth enamel which run perpendicular to the vertical axis of the tooth, and can provide the age at which the period of stress occurred when their distance from the cemento-enamel juncture is measured (Goodman et al., 1980). Periodontal disease was another relatively common dental pathology among the three collections, noted by resorption of alveolar bone, varied degrees of flattening of inter-dental surfaces, and calculus accumulations on supra-gingival dental surfaces (Ortner and Putschar, 1981). Periodontal disease affected eleven (11) individuals (57.9%) from 1992 NPW, as opposed to only four (4) individuals (40%) from 1986 NPW and five (5) individuals (33.3%) from NKH.

It is of great interest to report that no significant differences were observed among the dentitions of the three populations regarding ante-mortem tooth loss and cariogenic lesions affecting dental surfaces. Carious cavities are lytic lesions caused by bacteria which feed off of sugar residues on dental surfaces (Mandel, 1979). Caries were identified on the dental surfaces of five (5) individuals (26.3%) from 1992 NPW, two (2) individuals (20%) from 1986 NPW, and three (3) individuals (20%) from NKH. The ante-mortem loss of teeth provided further information about infectious and/or traumatic conditions which had affected one or more dentitions. Upon the loss of a tooth from its alveolar socket, osteoblastic activity occurs to "heal" the bone surface. From the 1992 NPW collection, six (6) individuals (31.6%) exhibited osteoblastic recovery due to ante-mortem tooth loss, as did two (2) individuals (20%) from 1986 NPW and three (3) individuals (20%) from NKH.

Various aspects of dietary patterns could also be determined from the analysis of dental remains. Half or more of the individuals in the three collections had supra-gingival calculus deposits. Calculus accumulates on dental surfaces as a result of dental hygiene, as well as the preparation and nature of the foods consumed. Also, small cracks and flaked-off enamel around the rings of occlusal surfaces may be indicative of the use of buccal teeth for cracking nuts and other hard foods, or of the presence of an abrasive component in the diet. In the 1992 NPW collection, eleven individuals (57.9%) exhibited such enamel cracks, especially on the occlusal surfaces of buccal teeth. In the 1986 NPW collection, the number of individuals decreased to three (30%), and in the NKH collection, only four individuals (26.7%) exhibited enamel cracks.

Individuals in the three collections also revealed a rather high prevalence of occlusal wear. The occlusion of maxillary and mandibular dentitions slowly erodes the enamel on occlusal surfaces, revealing patches of secondary dentine. Dietary grit and/or partially-processed foods can accelerate the wear of occlusal surfaces, usually resulting in irregular platforms (Hillson, 1979). In the case of the three populations, relatively uniform, oblique surfaces were common, which may be indicative of the presence of dietary grit. Eleven individuals (57.9%) from 1992 NPW revealed moderate to severe cases of occlusal wear, as did nine individuals (60%) from NKH. However, the scenario for the 1986 NPW collection is very different. Nine individuals (90%) from 1986 NPW exhibited occlusal wear, in addition to five individuals (50%) exhibiting another form of dental wear which resulted from mechanical modifications of incisal surfaces of the labial teeth. This did not appear in the other two collections. Mechanical wear differs from occlusal wear in that it is characteristic of the use of teeth as a "third hand" when habitually performing a particular function. Another interesting phenomenon which was present in both of the NPW collections, but not in the NKH collection is the bi-lateral ante-mortem loss of maxillary canines and/or lateral incisors. Three male individuals from 1992 NPW and one male individual from 1986 NPW displayed this, and it may be related to the habitual and/or occupational use of the teeth for certain activities, such as rope-making (Agelarakis, 1996).

DISCUSSION

Having attained these results, it was observed that, from skeleto-biological, morphological and paleopathological points of view, little bio-distance exists between the two components of the NPW site. Great similarities between these two components are evidenced not only through the paleo-epidemiological record, but also through the biotic and abiotic components of their environmental contexts (Pigott, 1989, Agelarakis, personal communication). Hence, for the purposes of this study, the two cultural components of NPW were considered as a relatively homogenous bipartite population-unit--to reflect the two sequential cultural components--which could then be compared with the NKH site.

The differences in the demographic profiles in conjunction with the paleo-epidemiological record of the NPW and NKH populations provide insights into the socio-economic conditions which "affected" these peoples. The high ratio of individuals from NPW assessed to be in the Infancy I age subgroup is coupled by a very high percentage of LEH manifestations (nearly 75%). On the other hand, relatively few individuals from NKH were assessed to be infants, and there was a complete absence of LEH throughout the population. These conditions indicate that by the middle of the 1st millennium B.C./B.C.E., and with the introduction of iron production, better cultural buffer mechanisms existed for the care of infants during their crucial early developmental stages (Agelarakis, 1996). The other peculiar characteristic of NKH demography is the high mortality rate of juveniles, subadults, and young adults. It is possible that the mining of iron ores and the production of iron items proved to be so lucrative, that more young people were put to work in order to increase production.

The slightly higher prevalence of ante-mortem tooth loss and periodontal disease in the NPW populations reveals a low degree of oral hygiene which improves somewhat in the NKH population. The varied amounts of calculus deposits are similarly indicative of a lack of oral hygiene, and also implicate a slightly "rougher" diet than that of contemporary societies which consume highly-refined foods. According to Hillson (1979), the combination of the relatively high frequency of calculus deposits and the low frequency of dental caries demonstrates that the composition of the foods consumed in the region for three millennia was consistently low in carbohydrates/sugars and high in proteins. In addition, the degree of dental wear on occlusal surfaces partly supports the notion of a rougher diet (dietary grit), yet the uniform, oblique surfaces which resulted from mastication reveal that their foods were relatively well-prepared (Agelarakis, 1996). However, it is important to note that enamel cracks were identified on more dentitions from NPW (especially those from the earlier component of the site) than from NKH, which indicates the possibility that they were cracking harder foods, such as nuts.

While mechanical wear and the bi-lateral ante-mortem loss of maxillary canines and/or lateral incisors do not reflect dietary patterns, they are indicative of cultural influences and behaviors, such as habitual and occupational stress. The four male individuals from NPW who exhibited the bi-lateral ante-mortem loss of teeth ranged in age from one juvenile to one young adult and two middle adults. The completed osteoblastic recovery of maxillary bone in the areas where tooth/teeth had been lost indicates that they were probably engaged in similar activities, namely manipulating fibrous materials using their teeth (Ibid.).

Finally, the genetic variations of morphological characteristics, namely the shovel shape trait and the trait of Carabelli, provide a picture of an overall genetic continuity of the populations. The overwhelming number of individuals from both sites of the Khao Wong Prachan Valley which exhibited the shovel shape trait--a typical Asian type trait--is indicative of a retention of a dental epigenetic type trait of a base population, which was, however, open to gene flow (Agelarakis, personal communication). This is further supported by the rate of prevalence of Carabelli's trait (20-30%) amongst these people, especially when one considers that the prevalence of this trait increases consistently through time.

CONCLUSION

Forensic analyses of the dental remains of the peoples of the Khao Wong Prachan Valley have brought to light various aspects of the human condition in one geographic area in the course of nearly three millennia. The unique location of the NPW and NKH sites to copper and iron ore deposits affected every aspect of these peoples' existence. The foods they ate, the care given to children, and the dental pathologies from which they suffered are just a few examples of bio-cultural characteristics which were determined by their engagement in metallurgy. Their choice of occupation in turn determined their environmental conditions, economic system, and social groups. The shift in technologies, from copper to iron mining and production, resulted in certain cultural changes detectable in the skeletal record, but there remains a general view of cultural continuity in the region.

The window into the past of these peoples has now been opened and awaits further analysis by other scholars. The Thailand Archeometallurgy Project has already located skeletal remains from another settlement in the region which would greatly add to the existing database of knowledge and information. In addition, a complete synthesis of information from other TAP researchers is necessary to further reconstruct aspects of the living conditions and bio-cultural environments of these metallurgists in central Thailand. As we peer into this window, it is important to keep in mind just how much we do not know about these populations, and what we may never learn because it was not reflected in the archeological record. Only continued research in the future by a variety of scholars can provide more answers as more interest for such information is stirred.

ACKNOWLEDGMENTS

I wish to thank my mentor, Dr. Anagnosti P. Agelarakis, for his invaluable help and patience, but most of all for his unending inspiration and unpretentious dedication. Also, I would like to thank Dr. Richard Lund for his technical assistance. Finally, my gratitude extends to Dr. Augusto Hacthoun, Dean of Academic Attainment, for encouraging and funding this research.

Faculty Advisor:

Fred Valdez Jr.

Archaeologically excavated whole vessels from the ancient Maya site of Kichpanha, Belize have been analyzed using the type:variety method. This system of pottery analysis allows for defining chronological developments and serves as a means for comparative assessments. The Kichpanha collection provides a direct view of an ancient Maya community in terms of developing complexity i. e., social interaction, political alliances, and economic growth from approximately 1000 BC to AD 1150.

INTRODUCTION

This paper focuses on the excavated and analyzed whole ceramic vessels from the ancient Maya site of Kichpanha, Belize. The analysis has identified these vessels and placed them into associated time periods seen at other sites in the Maya lowlands. The site is located southeast of Orange Walk Town, Belize (Figure 1) within a chert bearing zone surrounded by water resources (Gibson 1982). The site was recorded by the Corozal Project in 1973 (Hammond 1973) and the Colha Project in 1979 (Kelley and Valdez 1979) with excavations commencing in 1983 and continuing until 1990 (Shaw 1992).

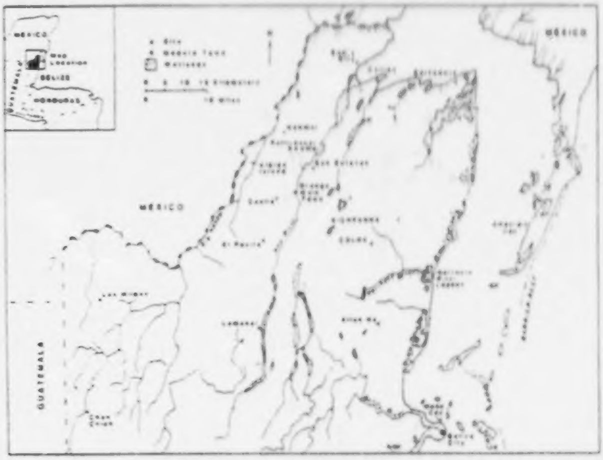

Figure 1: Belize, Central America with the site of Kichpanha indicated (Shaw 1992).

ANALYSIS OF WHOLE VESSELS

The time span at Kichpanha is represented by 33 reconstructable whole vessels, along with several thousand analyzed potsherds, that date the site from ca. 1000 BC to AD 1150 (Reese and Valdez 1987). Dates were derived by using the type:variety method of pottery analysis and comparisons to dated collections from other sites. The type:variety system of analysis isolates individual pottery elements into units that are similar (Willey et. al.

1967). Conformity of the material places it into intervals of years that are bounded by upper and lower limits; these limits are defined by change in the elements showing development in culture process (Gifford 1976).

The Middle Preclassic (ca. 1000-300 BC) is characterized by unslipped and monochrome slipped vessels. Red, white, black, and cream are the monochrome colors of this period (Sabloff 1975). Simple incised lines, fingernail impressions, and horizontal fluting occur as surface decoration (Adams 1971). Low-walled flat plates and medium to low necked jars are diagnostic forms (Willey et. al. 1975). There are two whole vessels in the Kichpanha collection of this period. Figure 2 shows general forms of Middle Preclassic Maya pottery.

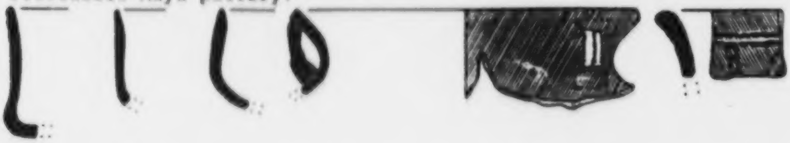

Figure 2: Examples of Middle Preclassic Maya pottery (Courtesy of the Colha Project).

The Late Preclassic (ca. 300 BC-AD 0) is dominated by the monochrome tradition of the previous period with the addition of orange as one of its colors and dichromes (the use of two colors) appear in small amounts during this period (Sabloff 1975). The labial-flanged bowl dominates and the jars of the previous period go unchanged (Adams 1971). The incision and surface modification are not as prevalent as the previous period (Adams 1971). Uniformity in form and technical aspects are refined typifying this time period (Adams 1971). Five whole vessels represent the Kichpanha collection during this time period. Figure 3 shows common Late Preclassic forms in Maya pottery.

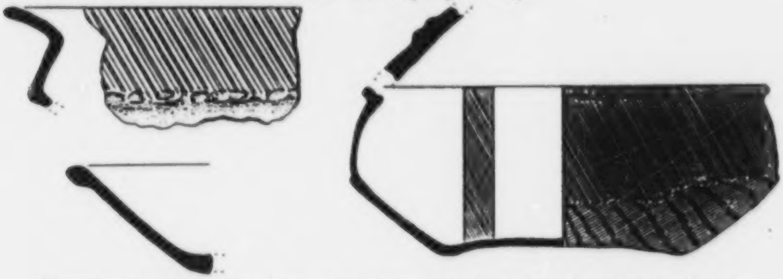

Figure 3: Pottery from the Late Preclassic (Courtesy of the Colha Project).

The Protoclassic (ca. AD 0-250) continues the same monochrome convention as in the previous two periods with dichrome frequency increasing (Willey et. al. 1967). The introduction of polychromes, the use of three or more colors, is seen in the Protoclassic, but they are limited in number (Gifford 1976). Parallel grooves and other abstract designs are seen also (Meskill 1992). Mammiform-footed vessels, Z-angles, and ring bases see introduction and medium necked jars continue during this period (Sabloff 1975). 14 whole vessels have been recovered from Kichpanha for the Protoclassic. Examples of Protoclassic Maya pottery are shown in Figure 4.

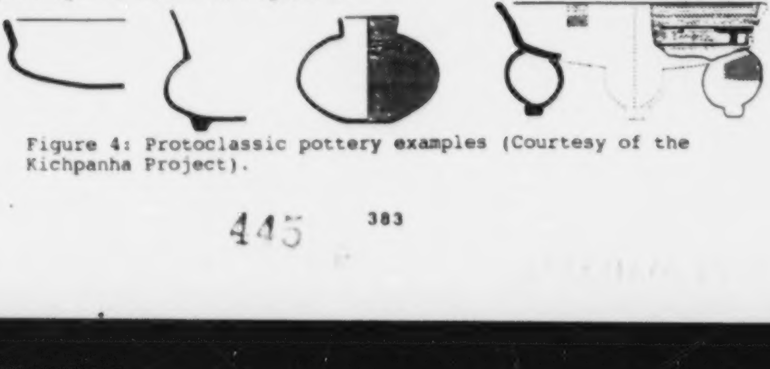

Figure 4: Protoclassic pottery examples (Courtesy of the Kichpanha Project).

The Early Classic (ca. AD 250-600) is dominated by orange and black monochromes and polychrome decoration on vessel interiors and exteriors (Willey et. al. 1967). Decorations are elaborate naturalistic animal motifs, glyph bands, and incision (Adams 1971). The ring base from the previous period is combined with a new basal flange and,a slab-footed cylindrical tetrapodal vessel emerges (Sabloff 1975). Kichpanha is represented by seven of these types of whole vessels. Figure 5 illustrates Early Classic Maya pottery.

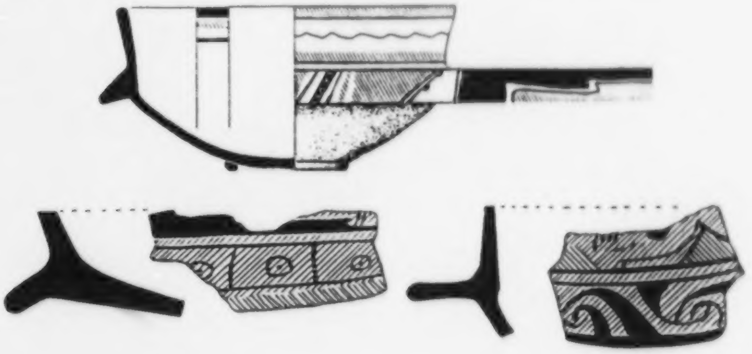

Figure 5: The Early Classic illustrated (Courtesy of the Colha Project).

The Late Classic (ca. AD 600-850) is represented by the greatest development in Maya lowland pottery (Adams 1971, Gifford 1976, Sabloff 1975, Valdez 1987, Willey et. al. 1967). Polychromes dominate with well conceived and executed motifs; red monochromes and unslipped vessels are quantitatively represented also (Willey et. al. 1967). Vessel forms consist of basal-ridged tripod footed plates, flat-bottomed cylinders, and thin walled jars (Adams 1971). Four whole vessels are represented at Kichpanha during this time period. Figure 6 presents a variety of vessels that occur during the Late Classic time period.

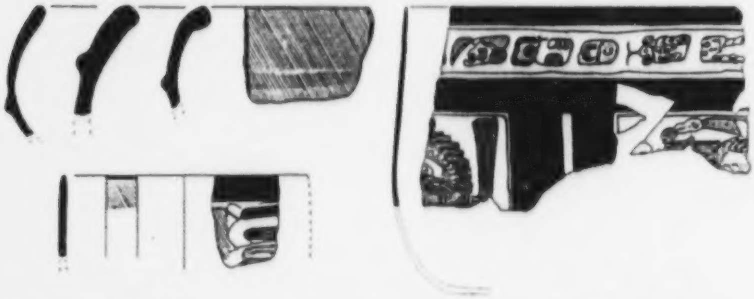

Figure 6: Late Classic characteristic forms (Courtesy of the Colha Project).

The Postclassic (ca. AD 850-1150) is characterized by unslipped and monochrome red or orange vessels. Although polychromes are present in the Postclassic (Gifford 1976) none are known from Kichpanha. A blue wash is also seen during this period (Valdez 1987). Diagnostic forms consist of anthropomorphic figures and vessels with scroll shaped feet (Willey et. al. 1967). One whole vessel occurs at Kichpanha during this time period. Figure 7 illustrates some characteristic elements of the Postclassic period.

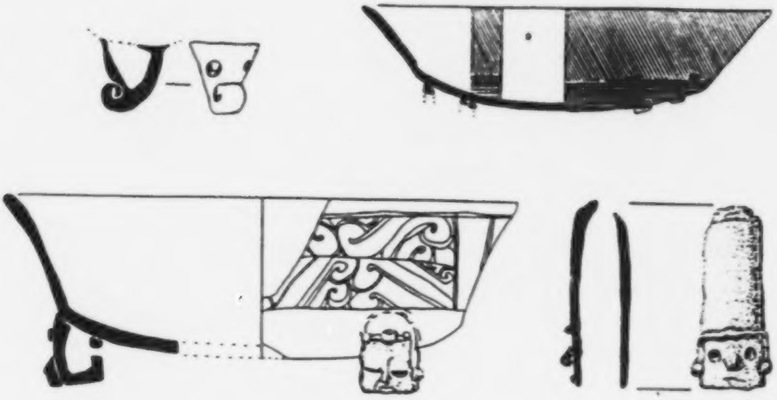

Figure 7: Examples of Postclassic Maya pottery (Courtesy of the Colha Project).

SUMMARY

A review of the attributes of each time period shows a shift from a modest pottery to an elaborately detailed pottery. Middle and Late Preclassic (ca. 1000 BC-AD 0) features include an emphasis on monochrome colors and surface decoration consisting of fingernail impressions and incised lines. The Protoclassic (ca. AD 0-250) is typified by an increase in the number of monochrome colors, wavy line incising with more complicated arrangements, and the introduction of mammiform feet on bowls, dishes, and plates. The Early Classic (ca. AD 250-600) sees an elaboration of polychromes, basal-flange bowls and incised abstract and geometric designs. The Late Classic (ca. AD 600-850) provides the greatest increase of polychromes and elaborate glyphic representations on the interiors and exteriors of vessels. The Postclassic (ca. AD 850-1150) represents a re-occupation of the site after a 100 year cessation. The styles represented in the Kichpanha collection are in the form of unslipped effigy censers and fragments of red slipped vessels and a blue pigment rather than a slip.

IMPLICATIONS

Early in a society's development everyone in that society is expected to contribute to its survival. As population increases less emphasis is placed on subsistence and the increase in specialists is seen. The support of these specialists is provided in return for the manufactured good that they generate. Through time the detail of these produced goods is mastered and artistic expression, in some cases, is seen. The variation in pottery form, decoration, and the expansion of colors used indicates this specialization.

The abundance and preservation of pottery serves as an excellent indicator of political, social, religious, and economic change throughout time in the Maya lowlands. Clay constitutes the raw material from which pottery is made which can be manipulated into an infinite number of shapes. The ability to vary shape and design allows an artisan to create a vessel according to what society demands at that time.

Through ceramic analysis it is possible to observe increasing specialization and complexity by the way pottery is manipulated as expressed by vessel forms and decoration. The lowland Maya began with relatively simple forms in the Preclassic terminating Classic life with detailed polychromes and glyphic expressions. This increased complexity observed in the pottery reflects similar developments in stone tool (i. e. chipped flints), jades, architecture, and in corresponding social institutions. A ceramic study cannot stand alone in determining social complexity; along with other artifact categories, minute changes in pottery attributes help to illuminate changes in cultural complexity.

Faculty Advisor:

Dr. Fred Valdez, Jr.

Late Preclassic Maya Pottery (ca. 300 BC - AD 250) excavated from several sites in northwestern Belize has been evaluated for function based on form and context(s). The collection analyzed is from the Programme for Belize Archaeological Project (1992 - 1996) and serves as a model for understanding ceramic shapes and their uses. Aspects of pottery form and function also provide information about aesthetic values, preferences, and interactions among the ancient Maya societies of the Late Preclassic Period.

INTRODUCTION AND BACKGROUND

The Programme for Belize Archaeological Project began its first season in 1992, with continuing research still in progress, to provide information about the ancient Maya of northwestern Belize. The project goals are to identify, through survey and excavation, the remains of the Maya in the Rio Bravo Conservation and Management area (Figure 1). The last five field seasons, from 1992 to 1996, produced more than 50,000 pottery sherds from several sites including My Lady, Ma'ax Na, Guijarral, Dos Hombres, and El Arroyo (Hughbanks 1995; Brown 1995; Houk 1996; Tovar 1996). The collection of pottery sherds used for this research is Late Preclassic, which dates from 300 BC to AD 250. During this time period, pottery characteristics changed rapidly with great advances in the technological abilities of the Maya. It is these changes that allow for interpretations of stylistic preferences. Pottery styles can indicate trade and exchange locally as well as long distance concerns while vessel forms (bowls, jars, etc.) are the basis for determining function.

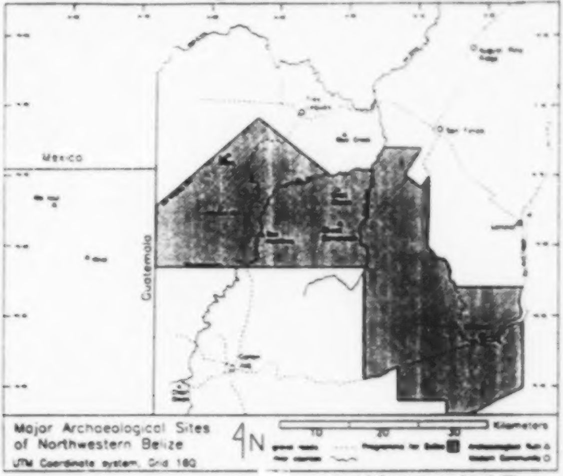

Figure 1. Map of the Rio Bravo Conservation and Management Area (shaded).

The objectives of this research is to provide information about: 1) the function of pottery; 2) aesthetic values and preferences of pottery; and 3) show the societal interactions of the Late Preclassic Maya as determined from the pottery. Each of these three objectives will be discussed below followed by an overview concerning the use of ceramic analysis for reconstructing ancient Maya life and belief (Adams 1971; Sabloff 1975; Gifford 1976; Valdez 1987). While not all encompassing, this research serves as a general point of reference for a potential use of pottery analysis.

POTTERY: FUNCTION, AESTHETICS, AND INTERACTIONS

The function or use of pottery is based upon vessel form which provides a practical perspective. Ethnographic analogy serves to verify the function of certain pottery forms. Bowls for example may be plain (i.e., non-slipped)or slipped (red predominates). Bowls may also have appendages such as a basal flange. Generally bowls are considered to function as storage and/or serving vessels. Unslipped bowls may be used for holding dry goods such as corn or beans. Slipped bowls are often used to contain liquids. The basal flange mentioned before may serve as a means for carrying hot liquids such as soups. The flange allows for greater carrying control and keeps fingers away from direct contact on what may be the hot surface of the bowl (Figure 2).

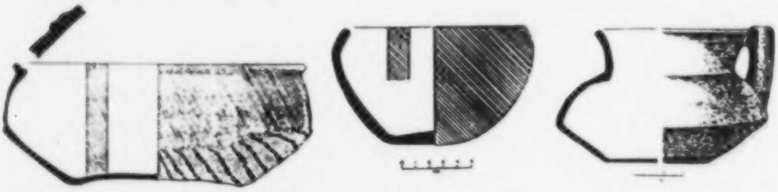

Figure 2. Selected Preclassic vessel forms.

Jars vary in size and surface treatment according to required function. For example, large jars represent communal serving and storage while smaller jars function as family consumption vessels. Surface treatment includes plain surfaces (unpainted) which allows the vessel wall to breathe or sweat helping to keep water cool in the container.

Slipped jars hold in liquids better than unslipped versions and can be used for cooking as well. All jars can also be used for storage, often long term, of dry foods. Appendages such as strap handles are common on slipped jars for ease of carrying while unslipped jars are often striated and without handles. The straps on the slipped vessels serve as a safe way of carrying the containers. The unslipped jars are striated to prevent the vessel from slipping, especially when wet (Figure 3).

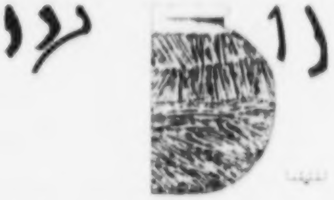

Figure 3. Example of a striated jar.

Other forms that indicate specific function include plates and bottles. Plates (or dishes) are considered to be serving vessels from which prepared food may be consumed. Bottles are most often used for holding a liquid. Bottles are also among the most elaborate inform. from simple undecorated forms to elaborate effigies i.e., in human and animal shapes.

One function, that of ritual or ceremonial activities may use almost any vessel form. However, the ancient Maya did make a censer ware, usually somewhat coarse in texture, that was used exclusively for ritual purposes. This function for the coarse surfaced pottery is determined from the consistent context in which these vessels are found, near temple tops and in caches which are defined as ritual offerings.

The aesthetics of Maya pottery can be observed on a great range of pottery types. Plain wares or monochromes exhibit preferred styles and what were probably the aesthetic values for these vessels by Maya society. More complex pottery includes dichromes (the use of two colors) and polychromes (the use of three or more colors) on various vessel shapes (Figure 4). Added to the use of color(s) is surface modification such as punctating, incising, and molding or modeling.

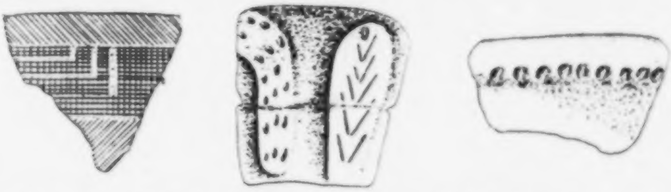

Figure 4. Various decorative techniques (bichrome, incising, punctating).

In the Late Preclassic period (300 BC - AD 250) Maya pottery changed dramatically in form variation and decoration (Meskill 1992). By the last century of the phase, pottery was quite elaborate setting the stage for Classic Maya expressions. Although monochromes are made and used throughout Maya history, surface modifications and specialized techniques of color enhancement become more commonplace as the Late Preclassic develops. Surface modifications include the use of punctation such as thumbnail impressions, reed punctating, in addition to incising, and carving to achieve certain decorative effects. Bichromes and polychromes are often accomplished through the use of several pigments for color (slip) differences. However, these color effects are also possible by resist or negative painting techniques, through the slip incising, and differential firing to name a few. These techniques are more commonplace on vessels from ceremonial contexts and burials. Some of these elaborate pots represent social status differences as expressed through access to these often unique items. In terms of aesthetics, the new and complex decorations and decorative techniques reflect a society becoming more varied in its artistic expressions and in what the ancient Maya society accepted as useful vessels.

Above surface modifications as a means of decorative effect, the modeling or shaping of vessel form was also an aesthetic concern. While most vessels are in the usual shapes of plates, bowls, and jars with the new decorative techniques, the production of effigy vessels becomes more apparent in the Late Preclassic. The latter is expressed through a range of bottles, bowls, and jars often depicting humans or animals (Figure 5). These Preclassic shapes are most often naturalistic forms.

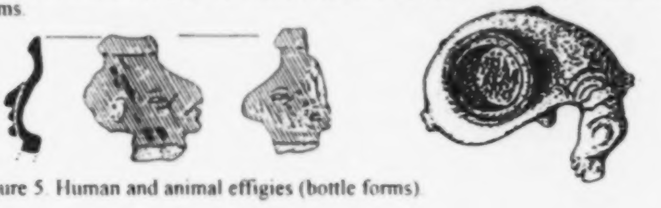

Figure 5. Human and animal effigies (bottle forms).

The Late Preclassic pottery allows a very special look at Maya society as it grew, became more complex, and set the scene for the Classic period to follow. It is possible to view increased interactions through the ceramics as pottery types become more uniform and the increase in form variation is duplicated at different sites. These systematic, but coordinated developments show an increased interaction and communication between Maya settlements.

Thus, interactions as commented above are those involving communication between sites and the Maya world in general. For example, in the Late Preclassic the pottery type called Sierra Red is recognized across the Maya lowlands. Local or site specific interactions are also apparent in the ceramic assemblage. These are best demonstrated in middens (trash deposits), burials, and caches (or special offerings).

Middens provide common or daily use pottery fragments. These can be correlated across a settlement to determine intrasite exchange. Particular households may share certain ceramic types indicating a social and/or economic relationship. Burials may serve a similar purpose when trying to determine access to selected pottery types. Especially important in burial vessels of the Late Preclassic is the opportunity to observe class or status differentiation. By the Late Preclassic, social ranking is very distinct as observed by the contents of burial furniture (Figure 6). These social differences in status are continued through the Classic Period as demonstrated by more complex types and greater numbers of pots placed with the deceased individual.

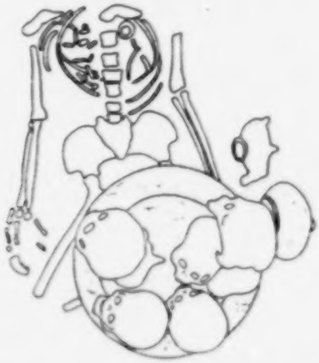

Figure 6. Late Preclassic Burial of a high status female (from Meskill 1992).

SUMMARY AND IMPLICATIONS

In summary, vessel function is determined from several lines of evidence including archaeological context, historical observations, and contemporary use. Thus, most designations of function for excavated pottery is securely founded. The defined functional use of storage vessel, serving item, for food preparation, etc. indicate the most common and probable use, but not necessarily the only use.

The aesthetics for Late Preclassic Maya pottery grew in various directions and expressions. The use of multiple colors accomplished through pigments, incising, and differential firing are but one expression of this society's aesthetic values. The increased use of naturalistic forms (human and animal) may reflect the ancient Maya world view during this period of rapid development.

The use of ceramics to determine interactions occurs at the regional and local level. These interactions may be family related, generally social as in obligation(s), or economic. Long distance trade of pottery or the ideas behind certain styles may be seen through the occurrence of similar materials at distant sites. Within a site similar interactions can be studied through distribution patterns.

Included in social interactions as determined from ceramic studies is the degree of ranking and status development most often observed from burials.

Ceramic analysis serves to define a number of valuable attributes of ancient life. From this study of Late Preclassic Maya pottery it can be said that ceramics had a wide range of functions as defined primarily from vessel form. Aesthetics become increasingly important through this phase and interactions can be described through the distribution of certain pottery types. While pottery analysis alone cannot answer all of the questions about ancient Maya life, it is certainly a very reliable scale from which to compare the development of social complexity.

Southern Plains Powwow Culture: Exploring the Identity of the Drum

Cindy Stout

Departments of Folklore and Anthropology
Indiana University
504 N. Fess
Bloomington, IN 47405

Faculty Advisor:
Sue Tuohy

When beginning research on Southern Plains powwow culture, confusing information is encountered about the instrument used in the performance of powwow songs. Singers refer to the drum as an 'instrument', and as a 'relative', and they refer to themselves as the 'drum'. This paper will analyze the processes by which the multiple identities of the instrument are constructed both as physical entity and in performance. The analysis extends to human participants because the identities of the singers are combined with the drum. These identities connect to beliefs about the power inherent in the drum, the personal power of male and female singers, and the power of performance felt by participants in the powwow events. This ethnographic study is based on interviews and participant observation from the summers of 1995-96.

Identity of the Drum

The drum is at the center of the powwow event and the focus of most participants' attention. The word "drum" signifies more than an instrument; it is inclusive of all singers that join in performance during the powwow. Without a drum (singers), there would be no powwow. The drum is a physical instrument and a separate entity. In Indian powwow culture, the drum is the single most important sign; the drum's spirit or heartbeat is alive within it and is believed to be a gift from the Great Spirit. Singers told me that the way a drum is put together will determine the quality of the drum's sound. A man wishing to have a drum made will often seek out a trusted and good drummaker. The thoughts that the drummaker has while constructing a drum influence the sonic outcome, because the sound that a drum produces is not just the sound of the instrument but also the thoughts of the drummaker. If a drum is properly constructed from the beginning, with good feelings and thoughts, it will have great strength and power. The two concepts of the drum as an instrument and the drum as referring to singers are tightly interwoven, contributing to the idea that the drum has a dual identity (Stout, 1997).

Elders believe the drum possesses great strength and exists as a person. Many people refer to the drum as an old man, and they treat it as a human with respect. Lamont Brown, a Ponca singer, explained

> Now, about that drum that we sing by. Our old people say when the drum is brought to you--when you accept the drum--it's just like adopting through Court as of today, another member in your family. You've got to be good to

> other people as they were good to bring you the drum--you got to take care of the people that brings the drum to you and everybody that's connected with it. Now that's the way our old people thought about the drum. (Maker, 1968:3)

Singers look after the drum, keep it covered and warm, and often keep it in the corner of a living room or bedroom. When a drum is used for powwows it is usually blessed. Blessing a drum does not involve an elaborate religious or sacred ceremony, but means it has been prayed over and smoked with cedar. The people praying ask that the drum be used in the right way, that it be used with good thoughts. A blessing is also asked for the singers that sit around the drum because they are considered part of it. Some singers told me when they think of this blessing, it reminds them that they are to come to sit around the drum with respect and good feelings. Head singers and other singers sit at their drum before a powwow begins and say a short prayer, asking for all these blessings and good things to be realized at that drum.

After a drum has been blessed it will not be used for certain things. For instance, a drum that has been blessed will never be used around alcohol, which is considered to be a contaminator. Drums used during a dance session for a powwow are never the same drums used at a 49 event. A 49 is an informal session that takes place after the dance session is over for the evening and may be held in a secluded place away from the dance arena if alcohol is involved.

The Drum's Power

The drum is the nucleus of the powwow event. This concept is obvious in the physical setting at Southern Plains powwows, where the drum is placed in the center of the dance arena. Dancers form the next concentric circle as the activity and attentiveness radiates outward. Normally, the head singer makes sure he has a drum--the instrument--and whoever wants to support the head singer will show up to sing. If a head singer is popular, two or more drums may be lined up in the center of the dance arena to accommodate the singers.

The contest powwow has changed the placement, although not the power of the drum. Today, due to drum competitions for contest powwows, singers practice as structured and fixed groups and choose to come to powwows as pre-formed groups with names. To allow enough space for drums and singers at contest powwows, groups of singers are often located at the outer edge of the dance arena. For instance, the 1996 Comanche Homecoming powwow in Walters, Oklahoma, featured six drums--one northern and five southern--around the outer edge of the arena. Although the arrangement of drums around the outer edge of the arena historically is seen at Northern powwows, the growing popularity of the contest powwow has helped this system find its way into Southern powwows.

The power manifest in a drum remains intact even though the central location of the instrument has changed. The drum--the instrument--acquires power and personality from its conception. The wood and hide used for construction of a drum bring the influence of nature and animals in contact with the drummaker and his prayerful, meditative thoughts. Treatment of a drum thereafter helps the instrument to become a social being.

Men's Power

Viewing the singers as extensions of the drum help to explain cultural expectations about and social pressures on singers which are inherent in the powwow. Head singers emphasize that to become a good solid singer, and to take on the responsibilities of a head singer, they have to know the songs, a knowledge that goes beyond remembering the words and melodies. They have to know which songs can be sung anytime and which songs are restricted in their use, which songs are personal songs and which are family songs. When asked, head singers will often say they have permission to sing a song, indicating that the song is owned by someone and that person has told this singer he may sing it anytime he wants. Head singers have background knowledge of nearly all song genres. Head singers are familiar with when and why they came to be used as powwow songs, including songs from ceremonies which are no longer performed.

When a singer accepts the position of head singer for a powwow he makes a commitment to bring his knowledge and ability as a singer, as well as enough other singers to sing with him. It is his responsibility to start at least the first four songs and to handle special requests for songs. He also should know which other singers have the ability to start songs, because he may pass the lead around to others. The pressure of musical leadership and singing at a powwow is placed on men. A successful drum and a successful powwow begins with male singers and their knowledge and ability (Stout, 1997).

Women's Power

During the course of my interviews with male singers, I asked them to tell me about the role of women as singers. Some answered with, "yes, there are women singers." When I tried to get more information, male singers simply said, "I don't know why they sing, I don't know anything about it. You have to ask a woman singer." The first female singer that I asked gave me the most perplexing answer. She told me women don't sing; they just sit back in their lawn chairs and take it easy. Later she said, "I sing because my Dad said, baby girl you're gonna help me out. You'll know when to come in and sing, just listen." Another female singer responded, "Women don't have any responsibility when it comes to singing. It's the man's responsibility." Later in our conversation, she also talked about helping out (Stout, 1997).

These kinds of answers to my question led me to search deeper, and I discovered that the role of women in singing is an unspoken, performance linked one. A singing performance sets up an interpretive frame in which to understand what women are telling me that they are doing. Women sit in their lawn chairs behind male singers at the drum, and they also listen very closely to the songs and start singing at loosely prescribed points in a song. Loosely prescribed, because women's singing is related more to the cultural aesthetics of powwow songs than to the formal structure of songs. Women don't just sit in their comfortable lawn chairs; they also sing. When a woman singer says she is not doing anything, just sitting there taking it easy, she means something very different than what a spectator watching the powwow would mean.

Beliefs concerning the relation between women and the drum vary from tribe to tribe in the Southern Plains; but there is a consistent view which relates to personal power possessed by women which at the time may conflict with the power of the drum. Women are included and needed in singing, but their contact with the drum is indirect. A woman's power during her menses could be strong enough as to have a counter-productive effect on the drum. The menstrual taboo is practiced by many women of child-bearing age when in close proximity to the drum. One woman explained that the feminine power might take power away from the drum. Because of this, women are not involved in the drum's guardianship. Some tribes believe women can touch the drum to receive its healing effects and blessings in times of need; other tribes believe women should never touch the drum. Many older women go to the extent that they will not touch men's drum sticks. One female singer told me that women should not be involved in making phone calls for a head singer to see which singers can show up for an event because those calls involve the drum directly and, therefore, only men should do it (Stout, 1997).

A preference for symmetry and duality conditions the need for female participation in singing to conform to a worldview of balance between feminine and masculine roles. One male singer expressed this desire for balance as a "hope" that women bring vital and passionate emotions with them when they sing. One younger singer told me she likes to sing behind a certain older man who is like an uncle to her. When he hears her behind him, he always turns his head a certain way, just a little, as an acknowledgment that he hears her. He told her that he sings better when he hears her voice behind him (Stout, 1997).

CONCLUSION

The power of the drum, meaning the instrument and singers as extensions of the drum, begins with the interaction between a drummaker and his raw materials and extends through the performance event. The careful prayers of drummakers and singers and their need to have only good thoughts while in contact with the drum display a conscious distinct effort and deliberate philosophy. The interaction of good thoughts and feelings continues as the drum is cared for and respected as a family member, and as singers let go of negative thoughts and search for good feelings. While men do not have to have women to help with powwow singing, they respond in a positive way when their help is given. All these conscious efforts heighten the power in the identity of the drum.

Among the reasons singers give for working hard at their role within their culture are personal, intangible, and spiritual rewards received from anyone that their singing touches. Many singers expressed a strong desire on their part, in cooperation with a group of singers at the drum, to relieve their listeners' personal stress and bring them strength--not to nostalgically transport listeners to a happier time and place, but to deeply touch and infuse listeners with inner strength. The songs make dancers feel strong and confident not only in their dancing but also in their personal lives. Listening to the singing of old songs and new compositions by the drum and watching the different styles of dancing can be a potent expression of sacredness, comradeship, and spiritual healing for spectators. Within the intercultural frame of the powwow, participants believe in the sacrifice of the individual and his/her identity for the spiritual well being, betterment, and continuation of the whole. Singers participating at the drum want everyone to enjoy themselves, to forget about their hardships. Singers [or the drum] strive to transmit a type of inner power to those in attendance; which makes the old person, whose strength is diminishing, forget his pains, standup and dance.

The Sexual Oppression of Women in South Korea

Tuesday M. Tamburri

Department of Sociology and Anthropology
Wells College
Aurora, NY 13026

Faculty Advisor

Leslie Miller-Bernal

INTRODUCTION

South Korean women's sexual oppression came to the attention of the international community in December 1991 after three South Korean women filed a lawsuit in Tokyo District Court, publicly disclosing the sexual abuses of women and girls by the Japanese Imperial Forces during World War II. These women, along with tens of thousands of other victims, became known as the military "comfort women" of World War II. Other forms of sexual abuse, occurring today on a daily basis in South Korea, such as rape, sexual harassment and forced prostitution, also began to surface at this time. This paper illustrates the experiences of the Korean "comfort women," as well as the sexual violence and lucrative sex industry in contemporary South Korea. As a means of fully understanding South Korean women's current sexual oppression, its historical and religious roots, as well as various modern perpetuants of women's subordination, are discussed.

THE SEXUAL OPPRESSION OF WOMEN IN SOUTH KOREA TODAY

The Korean Comfort Women of World War II

During World War II experts estimate that between 100,000 to 200,000 women and girls were "recruited" by Japanese military authorities for war-zone sex slavery in China, Southeast Asia and the South Pacific islands (Davis 1994; Hicks 1995; Hoon 1992). Approximately 80 to 90 percent of these "comfort women" came from Korea as a direct result of Japan's colonization of Korea during that time (Chung 1995; Hicks 1995; Hoon 1992).

Most documentary evidence relating to the actual numbers and locations of these battalions of "comfort women" was ordered destroyed by Japanese government officials at the end of the war, as a means of keeping this atrocity secret (Chung 1995; Hoon 1992). Some records, however, still survive, and more are emerging as researchers continue to dig through Japanese archives. Five reports found by a researcher looking through official records showed that "comfort women" were drafted as early as March of 1938 (Hoon 1992). They also showed that the Japanese Imperial Army first attempted to recruit these women through civilian agents, but as the war zone expanded a more violent approach was taken (Hoon 1992). Korean villages were raided in order to seize women, and Japanese officers even pressured schools to provide girls as young as twelve years old to feed the sexual desires of their armies (Hoon 1992).

Each "comfort girl" assigned to a military base was supposed to "entertain" twenty-nine Japanese soldiers per day, but in reality this number may have been higher in many battalions (Hoon 1992). For example, documents estimate that in China there were 1,000 "comfort girls" for every 50,000 or so Japanese troops (Hoon 1992). The conditions these women lived in were unbearable. One "comfort woman" recalled that the "rooms were very small. Each was big enough for two people to lie down in. At the entrance of each hung a blanket in place of a door. The walls and floor were laid with wooden boards, and there was nothing else. We were given a military blanket and had to sleep on the bare planks" (Yi 1995, p. 92). These conditions, however, varied by military brothel. The "comfort women" were heavily guarded by day, forced to slave away washing troops' clothes; and in the evenings, they were systematically raped by Japanese soldiers who were often times cruel, drunk, and physically abusive (Davis 1994; Hoon 1992). Under these conditions very few escaped, and many chose suicide.

The mark left upon these women was horrendous, and many never returned to Korea in fear of having to endure the harsh stigmatization placed upon women who engaged in sexual activity outside of wedlock (Howard 1995). The shame a Korean "comfort woman" felt was insurmountable because it was believed that the "shame of a woman was the shame of her whole family" (Howard 1995, p. vi). In Korea, "sexual defilement tended to be associated with promiscuity," even if it was against her will (Howard 1995, p. vi). Only since the 1990s have these "comfort women" publicly spoken about the horrors they underwent at the hands of the Japanese Imperial Army during World War II, and were able to unburden themselves of this terrible secret. It wasn't until August 1993 that they received a formal apology from the Japanese government (Corelli 1993). However, they have still yet to receive any official monetary compensation from the Japanese government, though they have from private funds.

Sexual Violence and Harassment in Contemporary South Korea

Today, sexual violence is one of South Korea's most severe social problems. The majority of South Korean women experience sexual violence more than once in their lifetime (*Women's International Network News* 1993). Women and girls from all age groups, including young children, are assaulted by men in the home, on the streets, in the work place and even in protective agencies, such as the police force (Davis 1994; Nam 1994; *Women's International Network News* 1993). An estimated 250,000 women were reported to have experienced rape or other forms of sexual assault in 1990, a threefold increase since 1988 (Davis 1994). A report by the National Police Agency, two years later, estimates that 9.8 women per 1000 are raped in South Korea; however, the Korean Women's Development Institute (KWDI) published a study which found that only 2.2 percent of rape cases are reported in South Korea. Even with only 2 out of every 100 rapes being reported, according to the International Criminology Institute (1992), South Korea has the third highest number of *recorded* sexual offenses in the world (Davis 1994; United Nations 1995; *Women's International Network News* 1993).

South Korea's Modern Sex Industry

South Korea has a thriving sex industry, and it is one of Korea's most lucrative tourist trades (*Christian Century* 1988). Since the 1970s, the number of high class prostitutes has dramatically increased with the promotion of prostitution tourism (*Christian Century* 1988; Clifford 1989; Lie 1995). The Korean government used the sex industry in national policy as one way to accumulate foreign exchange reserves (Lie 1995). In 1978, there were approximately 40,000 women in the sex business with this number increasing by the 1980s to at least 200,000 professional prostitutes (Lie 1995). Today, there are as many as one million women employed in the sex industry (Savada and Shaw 1992). Ironically, prostitution and other "decadent acts" have been illegal since 1962 (Morgan 1984). As a means of legitimizing the "tourist industry" the government issued identification cards to prostitutes that ostensibly declared them as "hostesses" (Morgan 1984). Later, sex tour prostitutes were required to go through a certification process which required them to have completed their junior high school education, pass periodic health examinations, and attend orientation lectures which ranged from practical knowledge – how to behave towards clients – to being indoctrination with the belief that they were aiding in the economic growth of their country (Lie 1995).

Prostitutes' clients include Japanese and Korean men, military personnel, European, American and Australian tourists, as well as businessmen and government officials. The Japanese, however, are their biggest clientele (Kim 1987; Lie 1995). Up until the 1980s, travel agencies, tour magazines, sports papers, and popular magazines advertised tour packages to South Korea which included the price of a female "companion" (Kim 1987; Lie 1995; Morgan 1984). The women working in these sex services are found in a large number of areas, including brothels, high class kisaeng bars, on the streets, erotic barber shops and coffee shops, masseuse parlors, and "room salons" which usually consist of a series of private rooms where approximately 2 to 10 men are entertained in each room by an equal number of women (Lie 1995).

THE HISTORICAL ROOTS OF SOUTH KOREAN WOMEN'S SEXUAL OPPRESSION

Religious Components

In order to fully comprehend the nature of South Korean women's sexual oppression, it is necessary to have an understanding of the religious doctrines and ideologies which underlie the cultural norms and beliefs. South Korea, though an economically advanced country, is a complex society that is rooted in many cultural and religious traditions which have oppressed women for many centuries. Though Confucianism was the major religion in Korea during and after the Choson Dynasty, Buddhism had previously been the dominant religion and had a significant role in shaping pre-Confucian Korean society.

Before the late 1300s, Buddhism was the primary religion in Korea (Haboush 1991). Under Buddhism, men and women, though not equal, were closer in status than later seen during the Choson Dynasty. Women were allowed a great deal of freedom and equality. They had equal inheritance rights, socialized and interacted with men relatively freely outside the home, were viewed as equal and active members of their family, even after marriage, and family lineage passed down through females, if they were the last member in their family's blood-line (Choi 1994; Haboush 1991; Park 1994).

During the late fourteenth century Confucian teachings began to dominate Korea, replacing the Buddhist system that previously governed the nation. The Korean Confucian state that emerged at this time redefined the entire culture, completely reconstructing the society in order to transform it into an ideal Confucian normative state. Social customs and norms previously held were completely overhauled and new one implemented.

According to traditional Confucian writings, the human world and the cosmic order were fundamentally intertwined (Deuchler 1977; Kelleher 1991). Confucianists believed that the human world had to model itself after the cosmic order and that both had to be in perfect equilibrium with each other in order for the human world to function smoothly (Deuchler 1977). If this equilibrium became unbalanced, disaster would strike mankind. Confucianists also believed that only men had the power and the means to prevent such disaster, and as a result men were the moral imperatives in the society (Deuchler 1977). Thus a belief in male superiority was indoctrinated into the culture on all social,

BEST COPY AVAILABLE

political and ideological levels. Consequently, women were degraded to an inferior and subordinate position.

Confucianism also penetrated the core of humanity in Korea by objectifying women's bodies. The *yin-yang* complementarity, the fundamental basis for the code of ethics in South Korea, established a static dichotomy between the sexes, delineating the sexual standards and cultural norms for men and women under Confucianism (Deuchler 1977; Kim 1993). According to the interpretation of the Korean Confucianists, males were regarded as the morally superior being, and they had the right to control and regulate women's bodies and sexuality.

The threat of rape and other sexual abuses to control women's activities and behavior began to be used by men more openly and frequently as a means of exerting their power and dominance over women (Nam 1994). "The use of sexual violence is an effective mechanism in controlling women's behavior...[It] reflects the patriarchal nature of the society in which men dominate women's sexuality and in which extreme forms of double-standards are applied to men's and women's sexuality" (Nam 1994, p. 61). Females were not believed to be individuals with rights, but rather mere objects. Women's purity, virtue and chastity were idolized in the culture, though a small segment of women were sexually exploited to serve the desires of upper-class officials. The majority of women were made to suppress their own erotic desires and to see their bodies as *men's* property. At the same time men's promiscuity and sexual desires were accepted and encouraged (Nam 1994). As a result of the double standards in the society, severe sexual oppression of women became entrenched in Korean society.

Korean women's subordinate roles, dictated by Confucian ideologies, are being marketed today (Kim 1987). Women's roles have traditionally been to take care of their men, and contemporary sex services use that ploy – "taking good care of men" – to lure in customers (Kim 1987). Traditional sex inequities in South Korea, based on Confucian beliefs and ideologies, have also contributed to the development of the sex service industries (Kim 1987). The devaluation of women and the objectification of their bodies aid in promoting Korea's sex trade. "Certainly the sale of women for foreign exchange is easier in a society where women have been regarded as objects for use by men," rather than people with rights and an inherent value (Kim 1987, p. 133).

Kisaeng Entertainers

Korea's tradition of using women as "entertainment" has deep historical roots beginning around the seventh century, during the Silla Dynasty, with the *kisaeng* (Jayawardena 1986; Lie 1995). The *kisaeng*, a state organized group of female "companions" were exploited sexually to service the carnal indulgences of upper-class men, were assigned to duties in both capital and local jurisdictions (Lie 1995; Savada and Shaw 1992). During the Koryo Dynasty (918-1392), when Buddhism was the major religion in Korean society, the *kisaeng* became an institutionalized form of entertainment for men in the upper classes and nobility, and by the Choson Dynasty (1392-1910) they were firmly entrenched in Korean society, completely dependent on state patronage (Lie 1995). This ironically came at a period in Korean history when women's chastity and virtue were idolized and regarded as their key to social standing.

The *kisaeng*, who were required to be beautiful, came mainly from the lower classes (Jayawardena 1986). These women formed their own caste, as daughters of the *kisaeng* usually followed in their mother's occupational footsteps (Lie 1995). Male children of the *kisaeng*, on the other hand, were often adopted and legitimized by the father and taken into his family, as bearing males was a sign of status for him. The *kisaeng* also functioned as a guild system because a woman's "trade skills" were passed down to younger generations within the caste (Lie 1995). The caste had a hierarchical structure, with different levels of power and esteem among the *kisaeng* (Lie 1995). The lowest rank consisted primarily of prostitutes who specialized in sexual work (Lie 1995; Savada and Shaw 1992). In the second tier, there were entertainers and part-time courtesans (Lie 1995). The highest rank was similar to the Japanese *geisha* (Savada and Shaw 1992). These women were exceptionally beautiful and/or artistic. They served high officials and performed at state functions (Lie 1995).

In some ways, the *kisaeng* had more freedom than non-*kisaeng* women. The *kisaeng* interacted on nearly equal terms with their male patrons, which was very uncommon during the Choson Dynasty (Savada and Shaw 1992). Although they could not officially marry, the *kisaeng* were often taken by the *yangban* (the ruling elite) and government officials as concubines or secondary wives (Lie 1995). Others had "surrogate" husbands (*kibu*) who acted as their managers (Lie 1995).

The *kisaeng* were trained at a special institute called the *Kyobang*. It was there that they learned to perform and perfect their "talents" as professional entertainers (Jayawardena 1986). These women were trained to provide a number of tasks and functions. Not only did they learn to sing, dance, play musical instruments, engage the royal court in lively and witty conversation and serve their masters, but were also taught to perform such duties as medical work and needlework (Jayawardena 1986; Lie 1995; Savada and Shaw 1992). Their function was to entertain, sexually and non-sexually, at court and at the houses of the nobility (Jayawardena 1986). The talented *kisaeng* excelled at all these traits, as well as the fine arts of painting and poetry (Savada and Shaw 1992).

By the end of the Choson Dynasty, there were approximately 20,000 to 30,000 *kisaeng* (Lie 1995). These female entertainers also often became the victims of severe sexual aggression, such as, rape and other forms of sexual assault and physical abuse, which laid the foundation for future widespread sexual oppression against women in Korea.

Prostitution Under Japanese Occupation (1910-1945)

During Japan's colonial rule over Korea, the sexual exploitation of women changed dramatically. The Japanese transformed the small *kisaeng* system for the Korean elite into an entrepreneurial sex industry for the masses (Lie 1995). State patronage for female entertainment and sexual services ended, giving way to Japanese commercial interests (Lie 1995). Women's bodies and their sexuality became a monetary commodity in the society, moving female "entertainers" into full-time prostitutes, creating a distinctly polarized division between respectable, virtuous women and the sex divas of Japanese entrepreneurs.

Three distinct forms of sexual work arose under Japanese rule, creating a hierarchy in the sex industry similar to that of the *kisaeng* system: elite call-girls, prostitutes, and military sex slaves. The *kisaeng* training program, however, did not completely erode. The Japanese established *kisaeng* schools, which replaced the Korean guild system, to train elite prostitutes (Lie 1995). The first school started in 1926 in Pyongyang (currently the capital of North Korea) (Lie 1995). Interestingly, the high tuition costs precluded poorer women from enrolling in these schools; this was unlike the caste system where this training usually passed down from mother to daughter (Lie 1995). Instruction was given over a three year period; girls learned both Japanese and Korean languages, as well as math, ethics, music, dance and the "art" of entertainment (Lie 1995). These well-trained call-girls created the upper echelons of the sex market, and were frequented by high government officials, *yangban*, and rich urbanites (Lie 1995).

Sexual work also expanded into urban areas, catering to both Japanese and Korean men (Lie 1995). Japanese sexual entrepreneurs (*zegen*) recruited and organized young Korean women from the lower classes, mainly from poor rural families (Lie 1995). Impoverished families often sold their unwanted daughters to these men in exchange for money, further devaluing female children in Korea, because girls were not regarded as important members of Korean Confucian society, and were expendable (Lie 1995). This second sector of the industry were primarily sexual workers, though they did perform and entertain like the *kisaeng*, only to a much lesser extent. Japanese colonial officials, soldiers and businessmen were their primary clientele (Lie 1995). The final stage of Japan's sexual labor force was the creation of "comfort divisions" for the Japanese Imperial Army stationed throughout much of Asia and the western Pacific (Lie 1995). These women became known as the "comfort women" of World War II, and they faced horrors about which they kept silent for nearly fifty years.

CONTEMPORARY FACTORS IN WOMEN'S SEXUAL OPPRESSION IN SOUTH KOREA

The Perpetuation of Women's Sexual Oppression in South Korea Through the Current Legal System

The present legal system upholds women's subordinate position through some of its laws and judicial proceedings. Rape is seen as a criminal act under Article 32 because women's chastity is the *property* of men and such acts violate men's *ownership*, not that rape is wrong in and of itself (*Women's International Network News* 1993). In order for a complaint to be filed and pursued, a woman must go to the court herself for a claim to be processed, and the complaint has to be filed within six months of the crime. In the courtroom she has to defend herself against accusations and insinuations that she invited the assault; that she did not resist hard enough; and that she does not deserve respect because of her reputation and sexual behavior (*Women's International Network News* 1993). This seems to be a fairly universal standard for the treatment of women who have been sexually violated.

Victims of sexual assaults, worldwide, tend to blame themselves for what happened. South Korea is no exception. Many Korean women avoid going to the hospital or counseling centers, especially in cases of rape, for fear of social stigmatization (Palley 1994; *Women's International Network News* 1993). Female chastity is still idealized in South Korea, and is one of the primary reasons why there is a very high percentage of unreported sexual crimes (Palley 1994).

Sex tourism is another area where the government and the legal system have failed to protect South Korean women. The blatant marketing of women's bodies ended in South Korea only after mounting opposition from various women's groups reached a level where the government was *forced* to act (Kim 1987; Lie 1995; Morgan 1984). The government had little intention of acting on its own accord. Kim Yung Chung, a cabinet member of the thirteenth National Assembly, stated that only about one-third of her colleagues in the cabinet took the issue of human trafficking seriously (Clifford 1989). She saw the problem as being not one of morality but rather one of violence (Clifford 1989).

Sexual Violence as a Control Mechanism to Suppress South Korean Women's Labor Movements

Sexual violence is used in the labor force and the police force as a mechanism to control and suppress women's labor movements in South Korea. Company owners encourage the patriarchal notion of female docility by relying on male supervisors to maintain order through any means necessary; this is reflected in various managerial tactics, such as verbal abuse, sexual harassment, and physical assaults on women (Seguino 1995). Sexual violence is also used in the course of police interrogations and in arresting striking female workers (Davis 1994; Nam 1991). Physical and sexual abuse are used by the state as a mechanism to control and suppress struggles and disputes. "Sexual assaults such as stripping, kissing, fondling, threat of

BEST COPY AVAILABLE

rape, and rape itself [are] used to control women's behavior ... [s]ince being raped or sexually harassed is such a stigma to an unmarried Korean woman" (Nam 1991, p. 60). These practices are reflective of the unequal gender roles in South Korea's patriarchal culture. Women tolerate such treatment because they see no alternative, and, until recently, they have had few places to turn to when such incidents occurred.

Economic Factors Contributing to South Korean Women's Sexual Oppression

The majority of South Korea's female prostitutes come from rural populations that are rapidly migrating into metropolitan areas (Lie 1995; Savada and Shaw 1992). As more and more rural women saturate the urban job market, fewer jobs are available to them. Prostitution offers a relatively attractive venue to women in economic distress, since they earn more than twice the amount of laborers (Lie 1995). These girls, however, only take in a small portion of the fee charged to clients, making it extremely difficult to escape the sex industry. The night's income at one Kisaeng House, for example, is approximately $1,700 for the house and $10 for each girl (*Christian Century* 1988). Out of a girl's nightly profit, she has to pay for her clothing, food, medical care, tips for the madam and furnishings for her room, and still try to send money home to her family (*Christian Century* 1988). The lack of police support to press charges against brothel owners, and the shame, humiliation and physical violence that women feel and endure are other reasons why women remain in the profession.

Pimps and madams recruit many young rural women who just moved into the city through false advertising (Lie 1995). They hang job advertisements in cafes or shops which offer three times the wages of factory work. Girls and women respond, only to find themselves working in bars or on the streets as prostitutes. There are also an increasing number of women, reaching into the thousands, that are being kidnapped, forced or coerced into prostitution to appease the increasing demand for prostitutes (Clifford 1989; Giarelli 1989; Lie 1995). "Korea is one of those sexually paradoxical societies where...women have to be virgins when they marry, [but] young girls are kidnapped off the streets to cater to the booming prostitution trade" (Giarelli 1989, p. 44). Women fear going out at night in certain areas of the country because of the thought that they might be abducted off the street. Human trafficking is not only perpetuated through terrorist means, but also through various employment agencies who sell women's work contracts to brothels (Clifford 1989). Rape and incest victims who are ostracized by the society, as well as women who have engaged in sexual activity with more than one man, often find prostitution as their only viable means of employment (Kim 1987). For many women, prostitution is their only alternative, if they want to survive.

CONCLUSION

The plight of South Korean women has been difficult. These women have had to endure extreme forms of sexual oppression since the late fourteenth century after the complete infiltration of Confucianism throughout Korean society. Women were not treated with respect and dignity, but rather as objects to be used at the mercy of men. Their bodies have been violently, sexually exploited during wartime, and enslaved into prostitution during peace. Today sexual oppression continues to plague South Korean women. Rape, sexual assaults and harassment are constant fears in women's lives, while South Korea's sex industry is still booming. There seems to be little effort on the part of the South Korean government to end these atrocities against women, perpetuating women's inferior status in the society. There are, however, reforms taking place by other sectors of the society, such as women's groups and organizations which are fighting to improve women's status and to bring an end to women's sexual exploitation. South Korea's economic move into the international arena, as well as women's increasing educational levels and economic independence, are also helping to bring about positive changes for women. As a result, South Korean women are gaining a greater awareness about their inferior position in the society and are coming to the realization there are avenues and international support systems that they can utilize as a means to improve their status and to fight for their rights as equal and vital members of South Korean society.

ACKNOWLEDGMENTS

I would especially like to thank Professor Leslie Miller-Bernal, as well as Professor Spencer Hildahl, both sociology professors at Wells College, for their unending support, encouragement and guidance throughout my writing process.

I would also like to thank my mother, Michele Tamburri, for without her I would not be here. Her love, faith and confidence in me have been unfailing lights at the end of a sometimes dark tunnel.

Evaluation of a Summer Orientation Course for New College Students
Critical Reading and Reasoning

Bloomington, Indiana 47405

ABSTRACT

The purpose of this project was to determine the effectiveness of a summer orientation class given to new college students entering the TRIO funded Student Support Services Program at Indiana University (referred to as Groups). Groups offers academic and financial assistance to a select number of students who are primarily low income and first generation college students. X152 Critical Reading and Reasoning is a class that all Groups participants are required to take the summer before their undergraduate studies begin. By acting as a participant observer in two different classrooms and by conducting interviews with the instructors and students from each class, the researcher was able to gather a great deal of qualitative data which was then used to evaluate the course. The class curriculum is designed to push students into a new mode of thinking. Teachers help their students' thought processes to grow beyond the concrete and into a more abstract way of analysis. At the end of the study, the researcher drew conclusions from the data and suggested possible improvements that could benefit both the students and the program itself for years to come.

LITERATURE REVIEW ON STUDENT LEARNING

William Perry Jr. (1970) developed the model that has provided the basis for subsequent models of student intellectual development. Kloss (1994) describes the nine levels of development that Perry determined from his interviews with college students, moving from dualism to commitment in relativism. Kloss considers movement from a dualistic to a multiplistic way of thinking as the goal for beginning college students. He describes dualistic learners as those who expect teachers to reveal absolute truth to students. Learning is memorizing, and peers are not seen as sources of knowledge. However, as dualists hear more opinions and interpretations, they begin to feel that no one knows all the answers, this is the beginning of multiplicity. As instructors demand evidence to back up opinions, students learn a new way of managing information and ideas. Eventually, they will move into relativism where they are able to argue their own positions and value those of others. Finally, these views are transferred from the classroom to a real world situation, and the final stage is reached -- commitment in relativism. Kloss' interpretation and application of Perry's scheme provided the basic framework for setting up this study and analyzing the data.

RESEARCH SETTING

At Indiana University, a course entitled "Critical Reading and Reasoning for New College Students" is offered in the summer for all students entering Indiana University through a federally funded U.S. Department of Education TRIO program (Student Support Services) referred to on the campus as the Groups Program. The course curriculum is designed to orient new college students to the academic culture and expectations of a university. The six objectives of the course given to the students appear below and these objectives, particularly the first two, seemed comparable with Kloss' goal of moving students from dualistic to multiplistic thinking.

- To help you improve your reading, extend your range of strategies, and especially increase your ability to read and think critically.
- To give you experiences with a variety of texts that represent the kinds of reading you will be doing throughtout your college career.

- To encourage you to identify and reflect on problems that will affect your future society and occupation or profession
- To familiarize you with resources and methods for doing your own research, answering your own questions, and solving your own problems
- To help you develop your own learning strategies, coping skills for success in college, study groups and other support structures
- To give you tools and resources for making informed decisions about your major and future career (Pugh, 1993)

METHODOLOGY

The specific research questions were as follows:

How do students perceive the content and their learning experiences in the course?

How do instructors perceive the content and their students' learning experiences in the course?

What are the strengths and weakness of the course, and how can it be improved for the next group of students?

The researcher chose a qualitative methodology employing participant observation in two sections of the course and interviewing students and teachers. Class A was observed eight times and class B ten times during the eight week session. As Bodgan and Taylor (1975) state "prolonged contact in the setting allows them [researchers] to view the dynamics of conflict and change and thus see organizations, relationships, and groups and individual definitions in process". In this role the researcher "blended in" as a member of the class, though students were aware that they were being observed. Extensive field notes were kept both during and at the conclusion of each class.

Open ended interviews with each of the instructors separately and focus group interviews with groups of four students from each class section augmented information gleaned from observation-only sessions. Instructors were interviewed at the end of the course, and each focus group was interviewed twice, once in the middle and once at the end of the course. All interviews were audio recorded. In addition, a research assistant attended all interviews and took notes.

Data analysis consisted of going through all the audiotapes systematically and grouping comments from them under each of the initial research questions (see above), categorizing students' and instructors' perceptions separately. Then perceptions and comments from field observation notes were added to appropriate categories as well. From these categories themes were drawn that were then organized into answers to the research questions.

FINDINGS AND INTERPRETATIONS

Both instructors agreed that the curriculum served two main purposes: (1) to provide an introduction to the academic culture of college where they would be responsible for their own decisions and actions, and (2) to move students from a high school mode of thought, which is very concrete and straightforward, to a more complex and abstract mode of analysis and argument. However, the instructors also agreed that the students perceived the curriculum as too hard and often would be confused about how to complete an assignment without the instructors' help at every step. Both pointed to lack of maturity as well as lack of skills. Both were evident when students were unable to articulate their thoughts in an organized manner and showed resistance to the level of demand of the course. Instructor A stated that many students did not want to engage in the thinking processes necessary to be successful in college. They were afraid to take the leap between the concrete to the intangible. She also stated that "confusion is the beginning of the analytical process, it is okay to be confused."

In general there seemed to be two kinds of students -- those with a positive-minded, self-confident attitude, and those who, for whatever reasons, were not sure of their reasons for being in college or taking a course like this one. These attitudes were expressed in their evaluative comments about the course. One problem that seemed to be shared by both groups was a discrepancy between what they said they wanted and what they actually pursued. They seemed to have difficulty setting priorities and taking full responsibility for their choices. For example, when asked whose responsibility it was for them to learn, they characteristically replied that it was their responsibility, but they would not utilize opportunities to get help from the instructor. This ambivalence shows a dualistic stance in that they expected the authority to take responsibility.

BEST COPY AVAILABLE

Teachers were pushing students toward a more complex way of thinking while many students refused to let go of their concrete mode of thought The instructors wanted the students to experience ambiguity because this confusion would eventually lead to discovery and new ways of thinking, but the ambiguity made the students uncomfortable

The final project required that the students engage in research about the field in which they might pursue a career There were no definite right or wrong answers, just a world of possibilities The final project caused some students to put their goals into perspective and experience a reality check on what it would take to achieve these dreams Several students commented that they had changed their original purpose for being in college after doing this project In conclusion, the course was working as the instructors wanted it to because the students complained about the discomfort of being asked to think and deal with the instructors' refusal to give the right answer However, students were doing their own research, finding new information, and using that to find their own answers Both teachers felt that the program had pushed students into the beginning stages of cognitive development where they would eventually move toward more complex modes of thinking This stage would be comparable to beginning the move from dualism to multiplicity in Perry's terms

CONCLUSIONS AND RECOMMENDATIONS

Below are recommended actions which could could improve the program

- Start the selection process earlier in high school and offer the chosen high school students an introduction to advanced thinking at that time This way, students will be more prepared for college before arriving on campus for the initial Groups summer Both instructors thought that this was a necessary change because eight weeks is such a short time frame for an introduction to analytical thinking processes One of the instructors suggested that former IU Groups students could be matched with the prospective students during their junior year in high school and perhaps work once a week together analyzing current event issues She felt that even reading the newspaper together would give these students an advantage before arriving to the summer class
- Students show some misconceptions about the purpose in the course The curriculum should help students understand that thinking strategies are provided as tools, not as the primary focus of the class
- Students need to know that they will have to be accountable for knowledge that is not accommodating to them, that is, does not relate to them personally The curriculum should make students aware of this point and help students develop strategies for taking in information they do not immediately relate to themselves
- Instructors should make sure there is ample time for feedback after all quizzes and assignments despite the short amount of time in the summer session
- Speakers could be included as sources of information as well as texts, which was effective in one class and could be used in all classes in the program
- The course should be structured so that all students know what is expected of them and how to fulfill these expectations Different instructors may have different structures which work, but it is important to have a strong structure for students at this maturity level

The personality characteristics and interaction styles of least-liked children in kindergarten were examined to determine why they are not liked by their peers. Gender and race were also investigated. The children who were least-liked by their peers were identified through individual sociometric interviews. Personality characteristics and interaction styles were assessed through observer's completion of the Baumrind Preschool Q-set(1976), and teacher ratings (Cassidy & Asher, 1992). Results showed that children who were observed and rated as more withdrawn were less liked by peers. Girls were more prosocial than boys. Boys were more aggressive and disruptive than girls. No differences in social interaction were found for race. The findings have implications for classroom interventions to prevent children's withdrawal from peers.

BACKGROUND/LITERATURE REVIEW

During early childhood, peers play a significant role in the development of social competence. It is during this time that children learn how to be a friend and how to have friends. These lessons are important for a child's long-term social and emotional development. As they mature, children rely more on their peers and less on adults. For some children, peer relationships come easily (Eisenberg & Mussen, 1989). Some children have many friends and are considered socially competent. Other children have difficulty establishing and maintaining friendships. In a study by Sanderson and Siegal (1995), children who were classified as rejected reported feeling more lonely than did their popular, average, and neglected peers. However rejected children who had stable, mutual friendships reported levels of loneliness similar to their nonrejected peers. Parker and Asher (1987) and Hartup (1983) have established that having at least one friend is important for validation of children's self-worth. Children who have poor peer relationships are "at risk" for problems in social adjustments later in life (Eisenberg & Mussen, 1989; Parker & Asher, 1987). Problems range from dropping out of school to more severe criminal activities.

Researchers have investigated the relationship between group acceptance and social behavior. Much of the research is based on observations of children's behavior. In a study by Ladd, Price, and Hart (1988), children who played cooperatively with peers throughout the school year were more accepted by peers as assessed by sociometric ratings at the end of the year. In contrast, children who argued frequently had declining peer acceptance over the year. Putallaz and Wasserman (1989) showed that the peer entry attempts of high-status and average-status children were significantly more likely to be accepted and less likely to be ignored than the attempts of low-status children were. Howes (1988) found that popular children had an easier time entering into play with peers than rejected children did. Denham and Holt (1993) showed a positive association between likability and social behavior. Children who were friendlier, more cooperative, less aggressive and less difficult were more well-liked by their peers.

Another way of assessing children's social behaviors has been through teacher ratings. Rubin, Daniels-Bierness, and Hayvren (1982) asked teachers to rate children on three types of behavior, aggression/hostility, anxiety/fearfulness, and hyperactivity/distractibility. Children who were rated by teachers as aggressive/hostile were also likely to be rejected by their peers. Denham, McKinley, Couchoud and Holt (1990) also used teacher ratings, and finding a positive relationship between peer likability and prosocial behaviors. Children whom teachers rated as fairly friendly, skilled socially and not very aggressive were more liked by their peers.

Most of the research investigating links between group acceptance and children's social behavior has not examined the influence of gender on the association between acceptance and behavior. According to Hartup (1983), children of all ages interact with members of the same-sex more frequently than with members of the opposite-sex. Denham et al. (1990) discovered that gender exerted indirect effects on acceptance and behavior. Girls were more likely to engage in prosocial behavior which also resulted in higher peer acceptance. Fishbein and Imai (1993) also found that gender influenced peer acceptance. Both boys and girls showed a same-sex relative preference and opposite-sex relative avoidance. In a study by Urberg and Kaplan (1989), all subjects made more same-sex choices of play partners with increasing age

The influence of race on the association between acceptance and behavior has not been fully examined by research. Fishbein and Imai (1993) found that race did influence peer acceptance White boys, black boys and Asian boys preferred playing with white boys. All three races of girls preferred playing with same-race girls. However, Urberg and Kaplan (1989) showed that race did not seem to be a basis for choice of play partners. In fact, a review of racial influences on children's play behavior by Hartup (1983) supports the idea that race may be more of a factor in children's choice of play partners and friends after they enter the primary grades.

RESEARCH QUESTIONS AND HYPOTHESES

The overall purpose of this study was to examine the interactions of children with peers in kindergarten. Specifically, I identified the children who were least-liked by their peers and sought to answer the following questions: 1.)Why are these children least-liked?; 2.) How do least-liked children interact with their peers?; and 3.)What personality characteristics contribute to their low peer acceptance?

The Baumrind Preschool Q-set (Baumrind, 1967) was used for the observations of children's social interactions. Baumrind factors identified in previous research (Howes, Phillipsen & Hamilton, 1993) were used to see if there were differences in the factor scores of the least-liked and most-liked children. These factors include prosocial, outgoing, aggression and withdrawn behavior. I expected the most-liked children to show higher levels of outgoing and prosocial behavior than the least-liked children.

Teachers' ratings of children's social behaviors were also examined for their association with group acceptance. The Cassidy and Asher teacher rating scale (Cassidy & Asher, 1992), which includes four factors of aggression, disruption, prosocial behavior and shy/withdrawn behavior, was used. I expected children who were rated as highly prosocial to be most-liked. I hypothesized that children who were rated as highly aggressive would be least-liked.

Furthermore, this study examined the influence of race and gender on social behavior. Past research has not fully explored these influences. I predicted that race would not be a determining factor on social behavior in this kindergarten sample. I also expected girls to show higher levels of both observed and rated prosocial behavior and observed outgoing behavior than boys. I expected boys to be show higher levels of observed and rated aggression and rated disruptive behavior than girls.

METHODOLOGY/APPROACH

Twenty-nine children in two classrooms participated in the study. Ethnically, the sample was 62% Caucasian, 31% African American, and 7% Asian American.

Each child's social behaviors and peer interactions were observed by two independent observers during the winter and spring of 1996 and 1997. Observations of children's social behavior took place between 9:00 a.m. and 3:00p.m., the school's regular operating hours. These observations primarily occurred when children were free to interact with their peers.

The Baumrind Preschool Q-set (Baumrind, 1967) was used to measure the classroom behavior of individual children. The four factors derived from the Q-set are prosocial, outgoing, aggressive and withdrawn behavior (Howes et al., 1993). Observers rated the 72 items by placing them in a rectangular distribution: 8 items in each of 9 piles from least characteristic to most characteristic. Reliability (percent agreement = 70) was established between all observers before coding began.

Teachers were asked to complete the Cassidy and Asher teacher rating measure (Cassidy & Asher, 1992). This measure yields four factors of teachers' perceptions of children's behavior: aggressive, disruptive, prosocial and shy/withdrawn.

To measure group acceptance, children participated in a sociometric interview. For this interview, each child was photographed with a Polaroid camera. Children were presented with all of the pictures of their classmates and asked to place each picture in one of three bowls according to how much they like to play with each child. They placed the pictures of children they liked to play with "a lot" in the largest bowl, the pictures of children they liked to play with "a little" in the medium sized bowl, and the pictures of children they liked to play with "not at all" in the smallest bowl. Ratings of peer acceptance were standardized by sex within each classroom.

RESULTS

It was predicted that most-liked children, as rated by peers, would show higher levels of outgoing and prosocial behavior than least-liked children. Pearson product moment correlations were computed between the four Baumrind Q-set factors (prosocial, outgoing, aggression, and withdrawn) and peer acceptance. As shown in Table !, only one of the four correlations was statistically significant. Children who were observed to show less withdrawn behavior had higher levels of peer acceptance. It was hypothesized that children who were rated by teachers as prosocial would be most-liked by peers. Also, I predicted that children rated by teachers as highly aggressive would be least-liked by peers. Correlation were conducted between teachers' ratings of children's social behavior and peer acceptance. These results are also shown in Table 1. Children who were rated as less withdrawn by teachers had higher levels of peer acceptance.

Table 1: Children's Social Behavior and Peer Acceptance

Q-Set Factors	Peer Acceptance
Prosocial	.02
Outgoing	.31
Aggressions	.31
Withdrawn	-.57**
Teacher Rating Factors	
Aggression	.25
Disruption	.22
Prosocial	-.08
Shy/Withdrawn	-.39**

**p<.01

In order to determine if gender influenced children's observed or rated social behaviors, a series of t-tests was conducted. As shown in Table 2, boys were observed as significantly more aggressive than girls. A marginally significant trend was found for prosocial behavior. Girls were observed to have higher levels of prosocial behavior than boys. According to teacher ratings, boys were significantly more disruptive than girls and girls were more prosocial than boys.

To examine race differences in children's social behaviors, t-tests were also used. there were no significant differences found between Caucasian and African American children on observed or rated social behaviors.

Table 2: Children's Social Behavior by Gender

Q-set Factors	Girls (n=8)	Boys (n=21)	t value	p value
Prosocial	6.21 (1.02)	5.44 (.96)	1.89	.07
Outgoing	7.16 (1.05)	6.65 (1.42)	.84	n.s.
Aggressive	2.52 (.79)	4.06 (1.93)	2.17	.04
Withdrawn	4.22 (2.49)	3.56 (1.57)	.85	n.s.
Teacher Rating Factors				
Aggression	1.13 (.35)	1.75 (1.07)	1.60	n.s.
Disruption	1.29 (.33)	2.18 (.97)	2.52	.02
Prosocial	4.58 (.50)	3.83 (.64)	2.95	.01
Shy/Withdrawn	1.29 (.28)	1.43 (.55)	.69	n.s.

Note. Numbers in the table are means. Numbers in parentheses are standard deviations.

DISCUSSION

The purpose of this study was to examine the social interactions of children with peers in kindergarten. children with lover levels of peer acceptance were more withdrawn. this withdrawn behavior was observed by both teachers and researchers. Thus, it appears that children who are reluctant to engage in social interactions may prevent themselves from developing positive peer relationships. this lack of social interaction with peers in kindergarten may have adverse effects later in life due to underdeveloped social skills (Eisenberg & Mussen, 1989); Parker & Asher, 1987). to circumvent this possible outcome, teachers should be aware of children's withdrawal from the peer group and engage in intervention efforts. Such interventions might include careful pairing of socially skilled with unskilled children, facilitating peer group entry into play, and other social skills interventions.

Gender differences were found in both observation and teacher ratings. Girls were more prosocial than boys. Boys were more aggressive and disruptive than girls. These findings are in accordance with previous research (Denham et al., 1990). They also highlight the differences in girls' and boys' play styles, which may serve to enforce the gender segragation that is prevalent at this age (Maccoby, 1990).

The finding that race did not influence observed or rated behavior is not surprising due to the particular sample studied. children attended a university lab school known for having a multicultural curriculum. Furthermore, most of the children in this study were from middle- to upper-middle-class families. Previous research finding racial differences in peer relationships sampled a group of children from a lower socioeconomic class (Fishbein & Imai, 1993). It is quite possible that social and economic context play a role in race and peer relations.

This study found that children's social behavior was related to their peer acceptance. Differences were also found between girls' and boys' social interactions with peers. These findings suggest that classroom interventions should be undertaken to keep children from missing out on opportunities to develop social skills in early childhood.

ACKNOWLEDGMENTS

This research was supported in part by a grant to Dr. Leslie C. Phillipsen from The University of Memphis Faculty Research Grant Fund. I am grateful to the children and teachers at the Barbara K. Lipman Early Childhood School for their participation in this study. I thank Leslie Phillipsen, Elana Steinberg, and Sara Bridges for their assistance in this project.

THE HISTORY OF THE CIVIL RIGHTS MOVEMENT IN PRINCE EDWARD COUNTY, VA (1951-1964)

Susan H. Bagby

The years 1951 - 1964 were turbulent ones for the people in the small, Southside Virginia county of Prince Edward. Rather than integrate, Prince Edward County closed its public schools for four years. The dispute became part of the Brown vs. Board of Education decision. This study uses a series audio-taped interviews with local citizens detailing how they coped with the closing of the schools (e.g., loss of jobs, family displacement, tension between the Negro and white communities) and assesses the long range emotional and practical effects of the closingon those affected. Why the community still struggles with the abiding significance of race will also be discussed.

Prologue:

"I wish this integration situation in Prince Edward county could be laid to rest. Sometimes... I think people keep trying, even today, to dig it up and say you've got to know about it. That it happened. Yes, it's part of history, but as the expression goes, sometimes I feel like you are beating a dead horse" (Austin, 1995).

The *dead horse* Edith M. Austin spoke of is the history of civil rights in Prince Edward County. If it is true that horse has been flogged to death, someone needs to tell the horse, because that horse will not lie down.

Someone needs to tell the story of what happened in Prince Edward County because some cannot remember. Some do not want to remember, and some cannot remember to forget. But the story, a chronicle of a small Virginia county upon which the eyes of the world were once focused, needs to be told again and again. It is a harrowing account of the hours and the times, the fullness and the emptiness, the loss and discovery that are sewn into the fabric of peoples lives. The events in Prince Edward County, 1951 - 1964, were set in motion by two types of people: those determined to change the way they lived, and those who struggled to preserve the only way of life they have ever known. It is the story of our lives, then, and now.

Then

Prince Edward County is located 70 miles southwest of Richmond in the "rural underbelly of Virginia known as Southside" (Smith, 1965). Farmville, the major town in Prince Edward lies on the NE tip of the county on either side of US 460.

Forty-five years ago, life in this county changed forever through a series of improbable, extraordinary events. Farmville and Prince Edward became, alternately, a source of pride, scorn and the indelible benchmark of a changing order in the South.

In the late 1930's, like almost every other county in the South, Prince Edward was segregated: schools, churches, parks, clinics. Like almost every other Southern county, segregation meant separate and unequal. While tax rates for whites and blacks were the same, less money was appropriated for blacks in the county, and fewer public services were provided. No place in Prince Edward County were the racial discrepancies more apparent than in the county's educational system.

In the 1940's, education for a student in Prince Edward County was a priority, if he or she were white. In 1939, "the white Farmville high school had been rebuilt in part with Public Works Administration funds and insurance. It had a gymnasium, cafeteria, locker rooms, infirmary, and an auditorium with fixed seats" (Smith, 1965).

The same year the new white school was built, Prince Edward County broke ground for the new Negro high school, but the Moton High School had none of the facilities of the white high school. Moton High School's maximum student capacity was 175 pupils. When the 1945 - 1946 school term ended, Moton's enrollment topped 450 (Baker, 1996).

Two days after M. Boyd Jones, the new principal of Moton High School arrived in 1947, the county school superintendent, T.J. McIlwaine called. McIlwaine told Jones he was going to have to cut his $300 Moton science budget in half. Jones invited the superintendent to tour the school's one science classroom and showed McIlwaine Moton's complete science inventory: two test tubes and an alcohol lamp. "We have to service 250 biology students," Jones told the superintendent, "I don't know what to cut [;] you cut it" (Jones, 1995).

Eventually, local administrators formulated a response to the dangerous overcrowding of the Negro schools. The county hastily erected tar and plywood buildings on the back lot of Moton to accommodate the overflow of children. Hazel Davis, one of the Moton High School students, remembers the temporary buildings as tar-paper shacks: "'Everyone called them chicken coops. They were cold in winter and hot in the spring and fall'" (Baker, 1996).

On April 23, 1951, the Negro students of Moton High School walked out of class and refused to return for two weeks. The students hoped to call the community's attention to their school's inferior conditions and shabby facilities. The strike was led by 15-year-old Barbara Johns: " 'I was sick and tired of the inadequate buildings and facilities. I wished something could be done about it'" (Smith, 1965). From this feeling, the idea to walk-out was conceived.

After the strike ended, "the [students'] grievance had expanded from equal facilities to integration and the National Association for the Advancement of Colored People (NAACP) filed a law suit in federal court attacking the Virginia law requiring segregated schools" (Baker, 1996). In 1896, state laws enforcing segregation were ruled to be constitutional only if accommodations were equal as well as separate.

In 1952, a Federal District Court upheld Prince Edward's segregated education system, and ruled against the Moton plaintiffs' call for integration, but "found that the Negro schools were inferior to their white counterparts and ordered that the facilities be equalized" (Baker, 1996). Undaunted by the lower court decision, the NAACP immediately appealed the case to the U.S. Supreme Court. The Prince Edward County case, Davis vs. Prince Edward, was merged with similar court cases initiated in Kansas, South Carolina and Delaware. Eventually, these cases were consolidated to become Brown vs. The Board of Education of Topeka.

The legal suits, court action and the looming spectre of desegregation seemed to rouse the Prince Edward County Board of Supervisors to reconsider its tactics. Two months after the Moton High School strike, one month after the original lawsuit was filed, Prince Edward appropriated $850,000 for a new segregated school for Negroes. The new Moton High School, now Prince Edward County High School, was completed in 1953, but it was not a solution to the educational stalemate that divided the county. Negro educators looked upon the new school as a last-gasp gesture of die-hard Southern segregationists: "We didn't feel a sense of victory when the new R.R. Moton School was built. Not real victory, I guess we felt a sense of appeasement -- a sense of 'this will satisfy you now.' We were glad the children had an opportunity to go back to school, but it wasn't the answer" (Fisher, 1995).

By early 1954, "conditions in the county had changed drastically. Relations between whites and [Negroes] had become cool and resentful" (Hale-Smith, 1993).

On May 17, 1954, the nine white male justices of the nation's highest court ruled in Brown vs. Board of Education, that *"in the field of public education, the doctrine of 'separate but equal' has no place. Separate educational facilities are inherently unequal."* Furious Prince Edward County officials, along with those from several other counties in Virginia, quickly instituted a "massive resistance" plan against integration: County officials, led by Virginia's governor, Harry Byrd, and augmented with support from the state General Assembly, voted to deny funds and appropriations to any school district that followed the Supreme Court's order to desegregate (Heinemann, 1995).

Prince Edward administrators also took the extraordinary steps of establishing a private, publicly funded, segregated school for white children, and in mid-1959, closed all public schools to avoid integration. In early September 1959, when public schools were due to open, the newly-founded Prince Edward Academy opened its doors and welcomed the county's white children. Stunned Negroes watched public school buses carry the white children to and from school each day. The county's public schools were locked and chained and for the next five years there was no public school system in Prince Edward County.

When the school year came and went, and the county schools failed to reopen, Prince Edward County blacks struggled to find ways to cope. "A few classes for Negro children were held in church basements and homes" (Baker, 1996). These classes were taught by volunteers, displaced teachers and empathetic college students from the North. But these efforts faltered after a year or two because of a lack of money, personnel and supplies. "While a lucky few hundred students left the county to continue their schooling, the majority of the Negro students became part of a Lost Generation whose formal education ended abruptly, or never began" (Baker, 1996).

The Lost Generation

Driving west on Race Street in Farmville, the clean, well kept homes of the white neighborhood give way to worn, shabby houses and unkempt yards littered with trash. Middle-aged blacks sit on ancient front porches. Long, deep shadows have burrowed into the place in

BEST COPY AVAILABLE

their faces where there used to be smile lines. Restless, agitated, they look like they are waiting for something. They are called the Lost Generation.

"It hurt every black person in Prince Edward County in some way or the other, to have your schools closed... just so that your little children couldn't go to school with little white children" (Eanes, S., 1995).

The closing of the schools in Prince Edward was devastating. No matter on which side of the conflict people stood, for five years, lives were interrupted. "Across the nation, school segregation and the belief that one race is superior to another left scars that can still be seen today. In Prince Edward, where there is a feeling everyone is a neighbor, the battle was a little more personal" (Ruff, 1995).

While other communities across the nation, trying to manage integration, erupted into violence and turmoil, Prince Edward did not. Charismatic leaders with cool heads prevailed on both sides to keep the issue a "gentleman's fight" (Wall, 1995). Though there was no bloodshed in Southside, there were casualties.

"You didn't really know which way to go. You didn't know how to offer support -- you didn't have much support to offer. I'm thinking of persons who were not able to send their children away to school. Those children were so large and so old, they had been stopped in the third grade and fourth grade. They went on to the eighth.... but they lost tremendous educational skills in between that time" (Fisher, 1995).

When the schools closed, a generation lost a future of possibilities. Years later, old hurts that should have healed long before are still raw: "I left school as a child, and I came back as a man. They put me in the eighth grade, but I never caught up. I was treated different. Teachers gave us less instruction and attention... we were so big. It still hurts today... My math is O.K., but I can't spell like I want to" (Eanes, W., 1995). Grief cannot be measured in time, but it has been 46 years, and for many former Prince Edward students like William Eanes, the tears keep coming: "It's a hard feeling to take... just when I finally graduated [from high school, at 21], I got a draft notice. I wonder, why did I have to serve a country that forced me to miss four years of school? It hurts" (Eanes, W., 1995).

Ethel Fisher was a Prince Edward County elementary school teacher at the time of the closing. Fisher, now retired, is an astute historian of the life and times of Prince Edward County. Fisher cautions against characterizing events in Prince Edward as a great fight in which one side was completely right and the other, almost completely wrong. The course of human events is infinitely more complicated: "I don't have a feeling that we alone, were affected, blacks, I mean. Whites were affected too- because no way in the world you can do that much damage to me, and not do any damage to yourself" (Fisher, 1995).

There was not universal support among whites in Prince Edward County for the closing of the schools. A number in the white community were opposed to the schools closing: "Some whites couldn't afford Prince Edward Academy. They struggled to pay the tuition, they lost their homes... they suffered too. They were trapped. And, of course, being white, they couldn't sympathize... fearing reprisals" (Fisher, 1995). Poor white families in Prince Edward County found themselves in the same situation as the county's blacks: shut out of school. "People forget, all those white people crowing the loudest about not integrating and organizing private schools were the ones who could afford it. Our family was not rich, we were farmers, and when my grandfather spoke out against the closing the schools, our whole family was blackballed. Even today, I have two grown uncles who cannot read" (Hines, 1996). One white woman recalls during the time the schools were closed, she was embarrassed to say she was from Prince Edward County: "Everybody believed we were all racists here" (Scarborough, 1995).

After the schools closed in 1959, there were children of both races who were never able to complete their education. Those students just about to enter high school suffered disproportionately. In Prince Edward County, those four years without school meant those students would assume adult responsibilities, a hitch in the armed forces, full-time jobs, and family commitments.

When the schools reopened in 1964, some returned; most did not. They were too far along in their lives to turn around and go back to ninth grade. Life can only be lived forward, not backwards. If there is any legacy of what happened in Prince Edward County, sadly, that is it. Ernestine Herndon, a displaced Prince Edward school teacher forced to relocate her family and find employment over 100 miles away when the schools closed, concludes: "We were called 'The Lost Generation.' And some blacks in Prince Edward County today, say our children are still affected by the schools' closing: The parents and grandparents of students today did not finish school, they did not go back to school. They lost out, dropped out, became discouraged... and they do not encourage their children and grandchildren today that education is very important" (Herndon, 1995).

Now

In 1995, an out-of-town newspaper reporter came to Farmville to prepare a story that marked the 40th anniversary of the Brown decision. Few people would talk to him, even fewer would go on record. "Many whites wanted all the attention to go away. Many blacks nursed an anguish that- for all the articles, discussions and documentaries, they felt was not completely understood" (Ruff, 1995).

Today, the Farmville Herald, which 40 years ago, under the stewardship of powerful editor and publisher, J. Barrye Wall, rallied against integration and government intervention, is relatively silent, almost docile now. Currently, the Herald covers education matters and school events from all local schools -- public and private. Publisher and editor-in-chief Steve Wall, grandson of J. Barrye Wall, regularly, almost reverently, reports efforts to save the old Moton High School and convert it into a museum.

Margaret E. Hale-Smith, a researcher from Michigan State University came to Prince Edward in 1993 to assess the effect the school closing had on the community. Hale-Smith's study concluded, " Prince Edward County continues to experience anxiety about African American children in the public school system; the Prince Edward Academy [now the Fuqua School] stills functions in the community and is a reminder of the school closings, and the division of races in the county is still very much a reality" (Hale-Smith, 1993).

Hale-Smith reported the overall consensus within the county is that the black community has forgiven what happened in 1959, but has yet to forget. Hale-Smith found many respondents would like to see "some kind of formal acknowledgment by the county, or town of Farmville, of the trauma they suffered as a result of the school closings" (Hale-Smith, 1993).

Today, the Prince Edward County public schools are customarily ranked among the best in the Commonwealth, among localities similar in size and location. Prince Edward students have won state-wide academic honors consistently in recent years. The county's teaching staff is approximately 50% white and 50% black, while the racial make-up of the student population generally falls into the 60% black and 40% white range. Approximately 20% of the county's white student population attends Fuqua School (Brookover et al., 1993).

Hale-Smith's research suggests that integration has not been completely extended into the elementary school level: "Teachers reported black children are not invited to white students' birthday parties. They also noted the existence of some white and black cliques; but on the whole, they claimed that race relations between black and white students are generally congenial" (Hale-Smith, 1993).

Current race relations between adults in Prince Edward County are better, or worse, than 40 years ago, depending upon who is asked, and who is asking. "One professional white man who was an active, committed segregationist 30 years ago, now claims that he has been converted from his segregationist views, but blacks and some whites who know him have a somewhat different perception of him. They noted that he interacts much more freely with some Afro-Americans than he did formerly, but he only relates to those Afro-Americans he views as nonthreatening or those he perceives as 'knowing their place.' Afro-Americans who challenge the traditional racial relationships and who do not accept a subservient role in that relationship are highly condemned by this 'former' rabid segregationist" (Brookover et al., 1993).

For some in Prince Edward County, 45 years after the fact, integration is still a new idea: "Another older white man, who is perceived as liberal in his attitude toward Afro-Americans, reported that he still has some difficulty accepting them in new relationships. For example, he reported that he finds it difficult to accept the fact that an Afro-American man who has worked for him several years now comes to the front rather than the back door to discuss his work from day to day" (Brookover et al., 1993).

From the black community, there is tacit acknowledgment of the past and tempered hope for the future. "I think sometimes the white people in this area were shocked -- they were so accustomed to blacks 'staying in their place.' Then, this line of demarcation has been crossed, and they got scared. All of this, the school closing, it came from fear" (Fisher, 1995).

Understandably, the movement in Prince Edward County to turn the old Moton High School into a civil rights museum is controversial. Within the community, the Moton School stirs powerful memories once thought dampened, vividly back to life. Some want to see the school gone, and some want to save it as a landmark: "There it comes again, the same old people. The emotions are still there. They want to erase the R.R. Moton School so it won't be there. Some ask why keep dealing with it? Why keep bringing it up... lets get rid of it. But it is a thing we will never get rid of. Its imprint is there. I would love for that school to stay there. Moton is a mark on our lives. Like the Holocaust, Jewish people will never 'get over' that. We need to have Moton as a landmark... to say 'this happened.' Don't deprive us of our past. Some of those things helped us plan a future" (Fisher, 1995).

Epilogue:

Some say what happened in Prince Edward County 45 years ago, could have happened anywhere. *But it only happened here.* Confronted with the prospect of desegregation and integration, Prince Edward County was the only county in the United States to close its schools for an extended (five years) period of time. "I often think other counties had the same feeling -- to close their schools, but they saw how ridiculous this county was, and they said, 'No, we are not going to do that'" (Fisher, 1995).

"All men are created equal," Jefferson wrote. From birth, we are all granted the same rights, all imbued with the same responsibilities, but 175 years after Jefferson's words were written, all men were not equal in Prince Edward County. In 1964, under intense pressure from the federal government, and burdened with a new Supreme Court Order, public schools, now desegregated, reopened in Prince Edward County. Jefferson's words, if not fully understood by everyone in Prince Edward, were, at last, heard. Said President Kennedy, "Something has to be done about Prince Edward County. There are only four places in the world where children are denied the right to attend school: North Vietnam, Cambodia, North Korea and Prince Edward County."

Anyone interested in the extraordinary processes of integration and desegration should know the story of Prince Edward County during the years 1951 - 1964. The history of civil rights in Prince Edward is the story of education, dignity, and the way hard facts of life marred life in a small Southside Virginia community.

Prince Edward County today is quiet; Farmville is a picturesque college town. The events of 1951 - 1964 seem so long ago. In fact, two generations have gone by. Today, both black and white people in Prince Edward struggle with " the abiding significance of race [in their county]. They cannot quite find the word for what they suspect is in the hearts of the other race. Not 'prejudice.' Not hatred,' not 'intolerance,' exactly. It is, they say, something hidden, and always there" (Morrow, 1989). For people like Ethel Fisher, and those who have lived through it, the matter of the schools closing, and the place it holds in their lives, stays with them: "I guess many of those feelings... anticipation, intimidation will always be a part of us. Some things you don't live down. Some things you absorb... you go on with your life and just keep moving. You have to keep moving." ☐

ACKNOWLEDGMENTS

This paper belongs to a lot of people: Kitty Smith, extraordinary co-teacher of the civil rights class that started it all, Bob Smith, author of They Closed Their Schools, and Ethel Fisher, who was not only candid, but was candid beautifully. I also wish to express my appreciation to John Stuhr, and all the students and guest speakers from the 1995 honors civil rights class. A special thank-you for the Longwood Honors Program, Office of Multicultural Affairs and the Longwood Foundation for their financial support that made this project happen.

In writing this paper I have been helped immensely by the editorial counsel and steadfast encouragement of Susan H. Bagby, part-time crazy lady, full-time genius. Without her patience and enthusiasm, this project would not have been possible.

QUALITATIVE RESEARCH ON THE TEACHING METHODOLOGY OF GENETICS 348: A HANDS ON APPROACH

Tia Fluegge

Department of Education and Biology
Hamline University
1536 Hewitt Ave
St. Paul, MN 55104

Faculty Advisors:

Dr. Sandra Tutwiler and Dr. Presley Martin

A qualitative analysis of the teaching methodology and the learning behaviors and attitudes of students was conducted on a laboratory intensive Genetics class at Hamline University. While in the laboratory, the students worked in groups of three or four, designed and carried out research projects, and then gave presentations. In addition, they were able to witness the importance of technology in genetics by actually practicing the "science" and through the use of computers to simulate projects. The presentation describes, the higher learning outcomes and greater depth of knowledge when the students are given the opportunity to practice the science. It shows that students don't just memorize the information, but are able to analyze and synthesize the information. In addition, the students are able to build a connection between lecture material and their laboratory research which also contributes to a greater depth of learning. There are also intrinsic rewards such as motivation, pride, willingness to learn and an awareness of self and others.

INTRODUCTION

The course was started at Drexel University in Philadelphia as the Enhanced Bioscience Education Program (EBE) and was created by Dr. Presley Martin. At Drexel the EBE program offered a holistic, hands-on approach to science and was series of 5 biology courses centered around cooperative group projects. When Dr. Martin left Drexel to teach at Hamline, he brought the core ideas of the EBE along. Due to time constraints, the program was modified for the Hamline course but was true to the philosophy behind Drexel's program.

The main reason behind a hands-on approach is that the students learn the genetics better. They are able to relate the lecture and lab material by actually doing the biology opposed to just reading or hearing about it. According to Dr. Martin, the students are also able to retain the information because they are experiencing the material as part of their projects. They also experience the trials and tribulations of experiments that don't work out, differences in opinions, and incorrect correlation's. Furthermore, the students are utilizing their biology knowledge and terminology in application to their projects and when giving presentations to their peers.

In addition to the biology concepts taught in the Genetics class, students were required to perform other skills not traditionally associated with a biology course. While in the cooperative groups, the students had to design and implement the projects, actively gather supportive resources, and communicate both written and orally. The computer was also a major tool used in the class and the students became familiar with different genetic programs. These skills, along with the project-based approach to presenting genetic information, served to enhance student learning and application of biology material.

METHODS

A variety of research methods were used to correlate student analysis, synthesis and intrinsic rewards of learning. The classroom lectures were observed two times a week for approximately three months. During this time periodic scanning of the room was conducted, behavior was categorized (i.e. listening without writing, writing, talking, sleeping) and each category was given a percentage. Individual conversations and interactions between the students and Professor Martin were also followed, highlighting questions and answers. Questionnaires were used to access various kinds of information. In order to gain response on the understanding and attitudes after lecture, a questionnaire would be given, this was done on three separate occasions. A pre-class (beginning of semester) questionnaire middle of the semester questionnaire and a post-class (end of semester) questionnaire were conducted to determine changes in students' learning styles and attitudes. Dr. Martin would periodically asked the students questions about the speed of the class and the level of information given. He was also used as an evaluative source on learning and attitudes in the classroom. Another research method was through information assessment in the form of quizzes and tests. In particular, midterm and final grades, Genetics construction kits (GCK) pre and post test scores, presentation grades and lecture quizzes were assessed.

Throughout the semester, one of two lab sessions per week were attended and observed. The Tuesday lab which ran four hours and contained four cooperative learning groups was more closely followed. These groups were observed during lecture, had their group presentations videotaped, and also were interviewed individually as well as in a group. In addition, the students were provided questionnaires during lab. However, students were given the choice if they wanted to answer them or not. These questions focused on student attitudes toward this class, if they would use the material again, and how they rated this class against comparable courses.

RESULTS

The results of a pre and post semester questionnaire, a questionnaire in the middle of the semester, personal interviews, video, and lab questionnaires show that students felt they were learning and retaining information. Test and quiz scores show students were able to utilize the knowledge learned in a lecture format analyze the information and apply it to realistic genetic projects and experiences. The students were able to listen to their peers' presentations and synthesize the information. They were then able to question, discuss and critically analyze the information opposed to taking it at face value.

Pre and Post Test results of Gene Map

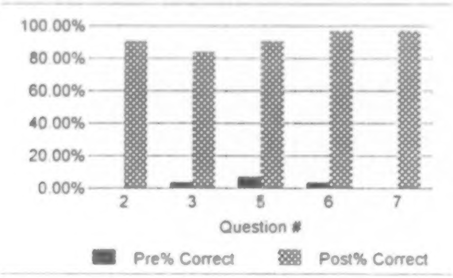

Figure 1 shows the results of a pre-test of Gene mapping prior to lecture and laboratory. The lab and lecture material closely related and the students completed the lab before the final test. The chart also shows the post-results of a similar gene mapping test.

The average score of this test was 92% opposed other test score averages of ~85%.

DISCUSSION

As with any evaluative piece, determining how much a student actually learned, opposed to how much is memorized is difficult. Learning is become capable in order to process, analyze and synthesize information. In addition, there is a discrepancy between copying a problem solving technique and actually understanding the function of the problem and utilizing it in a variety of ways. It is impossible to pinpoint a specific method of teaching that stimulates better learning. Rather effective teaching requires a culmination of intricate activities and interactions that generate an environment conducive to learning.

One of the first steps in providing the tools to learn in this class was through clear expectations. The students are given clear objectives and learning goals provided through unit outlines and pre-unit exams. The students indicated that the pre-unit exams were very helpful in identifying what they needed to know. There was no guessing or wondering about the important information.

The lectures were comparable to other college courses that utilized lectures. One student said this class is similar in lecture, had labs, but is different in computer use, more beneficial. The lecture portion of the class was mostly straight information delivery. Approximately eight people out of 30 felt they learned the most form lectures from the beginning of class to the end of class (Pre and Post Quiz). Although other students' learning patterns fluctuated from the beginning of the semester to the end, with many switching between learning the most on their own and learning through lab.

The questionnaire results showed that students said they learned the most from lecture, they most likely meant they understood the information, but did not learn the information. Student activity during lecture was generally passive, usually split between listening and note-taking. This lead to less learning of material and lower evaluation results.

An unexpected result of the pre and post lab questionnaire was the students choice to attend lab over lecture. Most students said they would rather attend a lab but felt they learned the most during lecture. However, in other questionnaires and interviews, the students said they were better able to understand lecture material in lab. The depth of knowledge in inquiry based education is greater when the students are able to analyze, synthesize and apply information when lab and lecture correlate. The students said they felt like they were learning, not memorizing. They would memorize in lecture and learn in lab.

Learning activities, hands-on labs, and projects in which the students were doing science contributed to a greater understanding and appreciation of the genetic information which was evident in the language, attitudes and assessment during lab and lecture classes. During lecture, learning activities allowed the students to analyze and utilize the lecture material. The students were given a scenario, question or problem to figure out. They would then have time to work on their own and then with the group to arrive at an answer. They would have to give an answer and explain their reasoning behind it. The students would analyze each other's answers and supporting data and either refute or agree. In such cases, the learning process was clearly visible. Even when students were incorrect, they were able to figure out why by synthesizing other's information and re-analyzing their own conclusions.

The labs were set up as a series of projects that the students designed and implemented while in a cooperative group situation. The groups were assigned by Professor Martin based on computer expertise. Each group had students with different computer experience. At the beginning of the semester, the groups were unable to commit to conclusions. They looked for specific right or wrong answers when there may have been neither. Later, they were able to discuss and explain problems with one another through small group and during presentations and were able to accept various answers for a problem based on the evidence each group presented.

Indications that learning was taking place was also shown through changes of opinion and discussion, much in the same way as lecture groups. Students were better able to clarify their own answers through discussion and even when wrong, able to see where they went wrong in their thinking process, go back and re-think a problem in order to get a better answer. Through questioning, an understanding of the material being presented could be directly linked to the hands-on projects they were working on. The ability to develop questions further indicates that their ability to synthesize the information is due to the actual doing in lab in contrast to the passive listening of the lecture.

The students said the lecture cleared up problems and concepts in lab (especially GCK) and the lab cleared up some problems in lecture (recombination and crossovers) and is a place to demonstrate that they know what they are doing (supports knowledge). Students often indicated this example in interviews and questions as a lab that really clarified and helped in the synthesis of information. From that knowledge, they were able to apply it in a variety of ways as shown through test scores, which were much higher for units that provided a strong link between lecture and lab than for other units. A specific project that correlated much better than the others was a series of problems called Genetics Construction Kits (GCK). Students attributed the difference in scores between the pre-test and post-test (Figure 1) to an inquiry based lab that corresponded well and had links provided to the lecture. The reverse was also true. The students had a more in-depth, or deeper understanding of the material because they applied and performed the information, rather than memorizing.

The presentations that the students gave were helpful in understanding and utilizing biological concepts and information. It was also a new experience for many of the students. At first, they were choppy, and the students looked to Professor Martin for reassurance. As time progressed, the presentations became much more fluent with more utilization of genetic terminology. The ability to speak like a scientist and use terminology was also evident through conversations between the students when discussing the projects and when casually speaking (i.e. making jokes). The students also gained confidence in their ability to speak in front of an audience about biology. In addition, the students used the computers in their presentations which was a new modem of communication for many. However by the end of the semester, the majority of students felt much more proficient at computer utilization and learned skills they could use again.

The end of the semester grades showed that students successfully learned genetic information. The lowest grades in the class were C's and the highest were A's. All the rest of the grades fell in between these grades. The grades indicate the students were able to synthesize and apply the information they learned.

Although this class was indicated as harder than other classes, the students enjoyed it. They had more opportunities to ask questions and ask for help (usually in lab) and there are more resources available: group members, classmates, a non-intimidating professor who explained the material well, and review sessions. One student said he didn't need to use a tutor as he did in other courses. Another student was able to apply the genetic knowledge to other classes such as psychology. The importance of genetics when researching many diseases was clear to yet another student through this course. The positive attitudes of the student's toward this class are apparent. From the questionnaire, a majority of students "significantly" liked this class over other comparable classes and would highly recommend this class to other students.

CONCLUSION

Learning processes such as analyzing, synthesizing and applying biological concepts and information as well as positive attitudes and rewarding experiences were obtained in a Genetics course which emphasized hands-on learning and cooperative groups. Major contributions to learning were the attitude and availability of the professor and the clear expectations and objectives. The students not only memorized information but were able to utilize it through application projects in which they felt they were doing science. They also gained skills in computers and communication. This class was notably liked more than other classes and would be highly recommended to others. Cooperative group structure during hands-on science versus individualized research in addition to the impact of computer technology are other areas of interest that should be researched within the context of teaching methodology.

SPATIAL DISTRIBUTION AND SOCIO-ECONOMIC PROFILE OF ASIAN INDIANS

Aaron Otto and Jayati Ghosh

Department Of Geography
University Of Wisconsin-Whitewater
Whitewater, Wisconsin 53190

Faculty Advisor

Dr. Jayati Ghosh

The United States has long since been known as the land of opportunity and for centuries immigrants from different parts of the world have migrated here for a chance to better their lives and start anew. This opportunity that drew many immigrants in the past has drawn numerous Asian Indians to the United States. The majority of Asian Indian immigration has occurred after the 1965 Immigration Act. Since then more then half a million Asian Indians have entered the United States in search for better income and education opportunities. The search has seemingly been paying off since most of these Asian Indian immigrants have become an important part of the United States social, economic, and political structure. Being one of the fastest growing ethnic groups in the United States to date, the Asian Indians have successfully become the one of societies most looked upon ethnic groups. With the massive increase in population of Asian Indians in the United States it is no question that this ethnic group is making it's presence noticed in the business market of today.

HISTORY OF ASIAN INDIAN IMMIGRATION

Although Asian Indian first arrived in the United States between 1899 and 1913, people still call their presence a recent phenomenon (Asian Central,1995). The number in which they came was not large by any meanings. Alarmed at the fewer then 7,000 Indians admitted into the United Sates between those years congress held special hearings on Indian immigration to stem what was called in that part of the century "the tides of turbans" (Mehra,1996). Most of these new migrants who came in the early stages were Sikhs from the Punjab region. They came to the United States and settled in the northwest region of the United States, where they found employment in lumber yards and the railroad building industry.

The majority of these migrants were men. The reason for this was that women were discouraged from immigrating in the country to prevent the "planting of roots" (Asian Central,1995). Americans only wanted to use the Asian immigrants for hard labor and then ship them back instead of letting them stay in the states and start a new life with their loved one. The Asian Indians were not considered as equals by Americans. One reason for this was the fact that they were not white. Instead Americans preferred European migrants and because of this the "Asian Exclusion League" was formed (Asian Central,1995).

There was much protest of Asian Indians in the United States, it caused riots in cities such as Washington and California. Hundreds of Asian Indians were forced out of the states and into Canada in 1907 (Mehra,1996). It was not until after 1965 that Asian Indians immigrated to the United States again. This was due to the amendments of the Immigration And Nationality Act, which made it possible for Asians to immigrate to the United States in large numbers once again. Of this large number of Asian Indians who migrated to the United States more then 1/3 live among ten different states: California, New York, New Jersey, Illinois, Texas, Florida, Pennsylvania, Maryland, Michigan, and Ohio (Mogeclonsky,1995). Traditionally Asian Indians flocked to the northeastern part of the United States and primarily the urban portion of New York and New Jersey, but California led all other states with almost 160,000 Asian Indians. Most of the Asian Indian population has lived in and around major Metropolitan areas. For example, in 1990 1.2 percent of the city of New York's population was of Asian Indian decent and 2.3 percent of Somerset-Hunterdon, New Jersey was of Asian Descent (Mogeclonsky,1995). In Wisconsin the Asian Indian population makes up 1.3 percent of the total population which is condensed in to two major cities Milwaukee and Madison (U.S. CENSUS,1990). This should come as no surprise since both Madison and Milwaukee are two of Wisconsin's major Metropolitan areas.

The Asian Indians migrated into three different waves since the middle of the twentieth century. The first wave of Asian Indian immigrants consisted of affluent Asian men from the 1960's. They came to the United States because of their qualifications. This is also what made it very easy for them to obtain green cards. Most are doctors, scientists, and other professionals who are now in their fifties and are at their peak earning potential (Mogeclonsky,1995). The women of the first wave usually do not work outside of the home and are usually, as compared to their husbands undereducated and speak little English. They carry with then no more then a high school diploma. The second wave of Asian Indians includes those whom came to the United States in the 1970's. The men in this group were highly educated professionals, but unlike the first many are married to highly educated women who work outside of the house (Mogeclonsky,1995). This wave understands the language spoken buy their parents, as well as speak fluent English. However they tend not to speak their native tongues themselves. The problem that is faced by this second wave is that there are such a small number of jobs allotted to them. Because of this the Asian Indians are not always able to find a job in their chosen field, therefore they are forced into taking a job that they are highly over qualified for. The third wave of Asian Indians consists of relatives of the earlier immigrants (Asian Central,1995). They are sponsored by established family members in this country. They are often less educated then the first two waves, which may explain the reason that they are the wave that is most likely running motels, convenient stores, and driving taxi cabs (Mogeclonsky,1995). In Wisconsin there can be found a mixture of all three waves of immigrants, but the majority are from the second and third waves. One reason for this is that children of the first generation immigrants who grew up in Canada migrated to Wisconsin in search for jobs and/or a college degree.

ECONOMIC AND SOCIAL PROFILE OF ASIAN INDIANS

The economic make up of the Asian Indian population is one that is not matched by many. The Asian Indians are having much success when it comes to there economic status in the United States. This status however did not come easy. The Asian Indians have a success story that seems to be masked by a reality of the situation, in that they are discriminated against. This discrimination is historical, it roots going back to the pre-1965 racist immigration laws that barred immigration from India, and the rest of Asia. Asian Indians, according to the 1996 Federal Glass Ceiling Commission's report, have been discriminated against in hiring practices, salaries, and advancement in the work place (Mehra,1996).

Nearly two in every three Indians over the age of 25 has a college degree, which is more than three times the national average (Mehra,1996). These Indians with their bachelors degrees typically earn $2,000 less than whites with comparable qualification and Indian women earn $6,000 less than white women (Mehra,1996). This all complements the fact that Asian Indians have the highest mismatched job rate of any ethnic group in the United States (Mehra,1996). The Asian Indians even though have these burdens upon them, have defied the odds and proven that they can become a very economically successful group, in part their success has come from the affirmative action programs that have been implemented. Asian Indians earn more than any other ethnic group in the United States except for the Japanese Americans (SUCCESS STORY,1996). On average an Asian Indian household makes 25% higher than the national average, which is around $44,700 a year as compared to the average United States household, whom earn around $31,200 a year according to the 1990 U.S. census. The Indian population throughout the United States is assuming positions of power.

Most of the Indian population are employed in professional fields such as medicine, engineering, entrepreneurial, and financial analysis careers. Of these professionals, 14 percent can be found in science, medicine and technological careers. To date there are more than 5,000 Asian Indians whom are faculty members at universities around the United States (SUCCESS STORY,1996). According to the Washington D.C. based center for immigration studies, Asian Indians are slightly over represented among managerial and sales-clerical workers and under represented among the blue collared workers (1990 census). In New York Asian Indians are over represented among taxi drivers. More than 40 percent of New York

BEST COPY AVAILABLE

city's 40,000 licensed Yellow Cab Drivers are Asian Indians (Mogclonsky,1995) Most of these Indians see this job as just temporary until they save up enough money to start their own business.

Another example of a over representation by Asian Indians is in the motel/hotel and dry cleaning businesses, as well as a few deli's. The expansion seen by hotel and motel industry for example was generated by the Indians. To day the Asian Indians own between 20-25 percent of hotels and motels in the United States (Nichola,1996). In Wisconsin alone there over 150 hotels and motels owned by Asian Indians either living in Wisconsin or neighboring states. The Asian American Hotel Owners Association estimates that the Asian Indian population holds about 12,000 properties (Nichola,1996). The restaurant business estimates that 1/3 of all Baskin - Robbins are owned by Indians (Nichola,1996). This high number of Asian Indians in these fields are contributed by the fact that most Asians are geared towards the idea of being their own boss. One reason for this is that when they own the business they are less likely to be discriminated against. According to the 1996 Survey of minority-owned business Enterprises released by the census Bureau, the number of Asian Indian businesses has increased by 120 percent. This increase can be seen in the greater Milwaukee area of Wisconsin where a number of new Asian owned businesses have emerged, ranging from your local convenience store to a restaurant. In Appleton, Wisconsin an Asian Indian family has recently opened up a restaurant that serves authentic Indian food.

Financial Security is important to most Asian Indian. Saving money is a part of Indian culture, as well as saving for education and retirement. It is estimated that on average Asian Indians save 15 to 20 percent of their income; this is 5 percent higher then the national average (Mogeclonsky,1995). As the Asian Indian population continues to rise many banks and companies are starting to target them. The Asian Indian buying power is estimated to be around the 20 billion dollar mark, which makes them a healthy target for many companies (Asian Central,1995). Asian Indians are large advocates of well defined life and property insurance, and many buy their policies in cash and carry little disability insurance.

Asian Indians are very demanding when it comes to where they spend their money. They tend to look for a company that is involved or acknowledges their lives, and companies that are doing so are gaining many new customers in return. One examples of this is Metropolitan Life, which recently sponsored a Asian Indian religious festival , Navaratri. This festival attracted over 100,000 people (Mogeclonsky,1995). In Milwaukee, Wisconsin, a local bank (TCF) sponsored a retirement and college savings workshop. By making these contributions to the Asian Indian society paves the way for many business opportunities for the sponsors, as well as making it known that the Asian Indian population has gained a foothold in the United States market.

On a broader scale companies such as AT&T and Network television stations are also becoming aware of this market and are trying to gain their patronage by meeting their needs in an array of different ways (Haniffa,1995). AT&T realized that most Asian Indians have family ties in other countries which they keep in touch with on a regular basis and have launched a marketing campaign that has introduced a India web site, which helps Asian Indian net browsers connect to people and information around the corner and around the world, and a "true reach savings" program that helps them save money on calls to their family members across the globe (AT&T,1995). Alpha Star a planned direct-broadcast satellite service in the United States has recently signed a agreement with the Asian Television Network in an effort to try to gain a ethnic niche in programming. This station broadcasts 24 hours of programming that is in both English and several south Asian Languages which consists of everything from movies and news to sports and talk shows.

Political power is something that many Asian Indians are becoming very involved in. Asian Indians for the most part usually stay in concentrated areas which gives them a real good power to impact politics when it come time for a congressional election. (Though concentration of Asian Indians is not always needed to have Asian Indian influence.) In Wyoming the Asian Indian population is the smallest of any state in the United States , but it was the first state in the nation to elect an Asian Indian to its legislature (Mogeclonsky,1995). Throughout the United States many Indians are assuming positions of power. Among them are President Clinton's Administrator of the Department of Transportation and the Director of the National Institute of Standards and Technology. This great political participation of Asian Indians in America stems from a foundation that is based upon family.

This strong emphasis on family and community are cared over into many aspects of the Asian Indian lifestyle Out of all Asian Indians only 4 5 percent have households that consist of no husband and only 1 3 percent are headed by a unmarried household In a typical Asian Indian family the head of the household consist of usually the male The father dominated characteristic is one that has roots back to Asia (India) in which all major decisions were made by the ruling male This trend is easily seen when it comes time to making the final decision on such things as major ticket items: appliances. automobiles. homes (Mogeclonsky 1995) This decision role is also carried over into the realm of the dating world for young Asian Indians (Canvas 1996) It is the father who makes the decisions on who their child will be seeing This characteristic has changed with the younger generation of Asian Indians One factor in this is that now there is an educated mother who has her own career as well as the father where in the older generation it was usually only the father who was educated and had a career

The community importance factor is visible in other parts of their lives In the business world of Asian Indians many whom have businesses have started a community buying power program in which they buy in bulk for many restaurants or convenient stores By doing this they are able to cut the cost on the needed goods (MULTICHANNEL.1995) This is also seen in other decisions that a concentrated group of Indians make For example. when looking for a place to bank an Asian Indian will usually go were his community or family have been satisfied. showing trust in their choose (Mogelonsky 1995) In many Asian Indian households there are sometimes more then one family living there. this goes back to the idea of sponsoring relatives that has recently come over to the states

CONCLUSION

The social. economic. and political role of an Asian Indian in America has gone through many different changes Socially. their roots are planted in the United States These roots bring with them historical traditions such as strong family values and a common bond between other Asian Indians with similar backgrounds Economically. this group has transformed from a intensive migrant laborer working for next to nothing into the doctors and professors of the 1990's with a net family income almost 25 percent higher then the national average Along the way they are making businesses feel their estimated 20 billion dollars of buying power Politically. the Asian Indians have been moving into position at al levels of the spectrum and have been recently using their growing population in concentrated areas to impact local elections Until the 1980's they were categorized into the Asian Pacific Islander heading of the census Since then they have been classified as Asian Indians in the 1980 and 1990 census data It is apparent that as the Asian Indian population continues to rise the social. economical. political role of the Asian Indian in the United States will increase From the state and local level to the national level. Asian Indians are making their presence known

Intra-Asian Direct Investment and Indian Economic Liberalization

Suzanne Peters and Jayati Ghosh

Whitewater, WI 53190-1790

INTRODUCTION

Defining the relationship between Intra-Asian investment and changing economic policy in India is vital to understanding of both regional and global trends. In the current global economy, rising labor costs and saturated domestic markets are forcing Asian countries with high levels of economic development to seek new labor supplies and new markets. India's population of 949.6 million provides both South Asia's largest labor force and its largest market. After nearly forty years of import substitution and high tariffs, India is focusing on export-oriented policies. At the same time, India is attracting capital, technology, and investments from both Western and Asian multinational corporations (MNCs) through economic liberalization. Pull factors for MNCs include India's domestic market base, expanding middle class, and large supply of skilled and unskilled labor. Asian MNCs also consider geographical and cultural factors in adapting processes and products to markets.

ECONOMIC POLICY AND FOREIGN DIRECT INVESTMENT

Economic development in India has not kept pace with development in other Asian economies. British colonial rule left India without an independent economy, and MNC foreign direct investment (FDI) focused on resource extraction, exporting post-colonial India's raw materials. The Indian government countered this practice with import substitution, and began to acquire assets discouraged by colonialism: capital equipment, entrepreneurship, technical knowledge, infrastructure, and skilled industrial labor. A foreign exchange crisis in the 1950s led India to re-think MNC investment. In the early 1960s, industries such as aluminum, electrical equipment, fertilizers, and pharmaceuticals, all of which had been restricted to the public sector, were opened to MNCs. Export processing zones (EPZs) were established at Kandla, with ownership and tax incentives for MNCs.

Fear of industrial stagnation brought policy reversals and import substitution was re-implemented. In 1970, patents were denied for chemical, drug, and food products to push Indian industries to develop substitutes. There were attempts to lure FDI by creating new EPZs, but growing limits on MNCs made India less attractive. The net result was creation of ownership advantage for India, following successful development of local resources. As Indian economic development internalized, MNCs lost competitive advantage to protected domestic industries. FDI stagnated under restrictions in the 1980s: actual average annual inflow of FDI was under $35 million, although FDI approvals averaged over $85 million (Zahid, 1994). At the same time, infrastructure obsolescence and substandard production limited the international market for Indian goods. The threat to foreign exchange led to exemptions from some restrictions: foreign equity in export-oriented firms increased, tariffs were cut, and imports of technical designs were permitted to stimulate technological development.

In the early 1990s, India's foreign debt increased, and the rupee was devalued. Structural adjustment policies dealt with the balance of payments crisis by stressing economic liberalization and austerity programs. Of all FDI approvals between 1991 and 1996, 60% were in priority areas for infrastructure modernization, such as communications, electronics, and power generation. FDI was allowed in services, imported consumer goods, and warehousing and FDI approvals jumped from $359 million in 1991 to $11.198 billion in 1995. Actual FDI inflows rose quickly from $154 million in 1991 to $1.958 billion in 1995, but were only 40% of approvals (Embassy of India, 1996). There are several reasons for this lag. Bureaucratic problems still remain at state and local levels. Constant shifts in economic policy failed to provide conditions for long term growth and stability. In April of 1996, investment reports cautioned that India was financially unsettled and politically unstable, and slowing in economic growth. Increased FDI was recommended, but short-term improvement was unlikely, since MNCs were concentrating on the domestic market, rather than on export production (Haniffa, 1996).

Past government policies tried to protect Indian economic interests from neo-colonialism by limiting foreign ownership. The flow of FDI was restricted, protecting inefficient state-run industries, and MNCs became reluctant to invest in limited joint ventures. Recent reforms are meant to reassure MNCs of increased control over their Indian assets.

ECONOMIC LIBERALIZATION AND FDI

Liberalization relies on attracting FDI, estimated at $2 billion for 1996, and expected to reach $10 billion by 2000 (Haniffa, 1996). Massive restrictions have been lifted, foreign brand names and trade marks are allowed, and EPZs have expanded the special status of manufacturers and exporters. FDI is allowed in sensitive areas like atomic energy, strategic metals and minerals, military equipment, and railroads. State-controlled industries like banking, communications, and highway construction have been opened. Project proposals in the electric power industry, where 100% foreign equity is allowed, totaled nearly $33 billion by 1995 (US Dept. of Commerce). At least $100 billion in other planned infrastructure development relies on FDI financing.

Once delayed indefinitely in federal bureaucracy, proposals are now being granted automatically in high priority industries. Proposals with foreign equity of up to 51% or foreign technology transfer receive automatic approval within two weeks of application. Foreign equity of up to 100% is accepted for completely export-oriented projects. Yet there are still obstacles to implementation of economic reforms. FDI approvals exceed inflow, indicating problems in the approval process. Privatization of state-owned firms, for example, is meant to provide a focus for FDI, but most of the quarter million state-run firms, which are chronically inefficient due to lack of competition, require government capital to operate. Deregulation stalls because remnant socialist-era legislation and powerful unions bar economic reforms, and buyers are discouraged by rules against layoffs of surplus labor.

Indian economic development is also affected by international trade blocs, which take India seriously as both competitor and collaborator. The Organization for Economic Cooperation and Development recently proposed including developing non-member countries like India. The agenda of such a group is essentially self-serving, and the benefits and risks of an association must be weighed against India's hard-won autonomy. Ultimately, the concerns of the trade blocs prove that India's potential economic power is already being recognized.

As a result, India is both sought as a trading partner and feared as a competitor, especially in Asian markets. India could emerge as an economic giant with the power to economically and politically destabilize the region. The influence of FDI on Indian policy will have a widespread regional effect, which will also affect world trade. Despite government emphasis on FDI, the World Bank states that it is unlikely to increase foreign exchange, or improve India's balance of payments position. FDI is important, but cannot offset India's massive debts and social problems. Attracting and keeping FDI may be increasingly difficult as there is intense competition among developing countries for available capital.

INTRA-ASIAN FDI

Although most FDI to India comes from US and European MNCs, the new international division of labor (NIDL) is bringing Asian MNCs as well. In the NIDL, countries with a higher level of economic development export labor-intensive production to less developed countries, and concentrate on capital-intensive activity. The NIDL relies on cheap labor, and Asian MNCs shift facilities from country to country, depending on production costs. Labor costs are low in India, especially in the informal sector, where employment is uncertain, labor is unorganized, and very low wages are accepted. Trade barriers in western industrialized countries (WICs) targeting specific countries can be avoided by exporting production. Japan, for example, shifted manufacturing to continental Asia because of lower labor and shipping costs, but also because WIC barriers discouraged Japanese exports. India's political infrastructure is more attractive than China's, having democratic government, independent judiciary, and private property rights. India also has an established banking system and stock exchange, while Chinese businesses prefer to bank overseas. Intra-Asian FDI takes advantage of India's strategic location near target markets as a base for regional transportation. Production in India can target the Middle East and Asia-Pacific regions through container ports. Asian MNCs which can also tailor regional production to regional tastes where ethnic groups have similar product preferences.

Japan, the major Asian investor in India, limited investments until recent reforms, yet maintained a strategic presence in India. Japanese firms took sub-normal profits for decades while keeping in contact with potentially lucrative Indian markets. Their perseverance placed them strategically to take immediate advantage of liberalization. The case of Maruti-Udyog Ltd., a Japanese-Indian vehicle manufacturer, shows this long-term focus and possible benefits for India. The Japanese MNC, Suzuki Motors, upgraded facilities and retrained local workers. Suzuki adapted quality control and management to local conditions, and emphasized gradual indigenization of production. At first, nearly complete vehicles were imported into India for assembly, until local firms could supply ancillary production (Joseph, 1990). The Maruti-Suzuki partnership employed 5,000 people to produce more than 130,000 vehicles, at a rate of 26 vehicles per employee. Mahindra, an Indian vehicle manufacturer, employed 12,000 workers in 1993, yet was able to produce only 82,000 vehicles, fewer than 7 vehicles per employee (Dahlburg, 1994).

Japan is only one of the Intra-Asian investors in India. In the 1990s, newly industrialized economies, such as Korea and Taiwan, have invested surpluses in developing Asian countries. Their FDI into India, however, has been limited. Much of India's competition comes from much smaller countries, such as Vietnam, which have aggressively pursued FDI. Like investors from other parts of the world, Asian MNCs avoid directing FDI to India's many inefficient industries.

FDI POLICY IMPLEMENTATION

Economies in Asia follow a cycle of sustained investment, trade, and growth: export-oriented development policies initially attract FDI, which encourages favorable policies, sustaining the cycle. In India, however, past policies focused obsessively on Indian control of MNCs, rather than on promoting FDI inflows, weakening the investment-trade-growth cycle. Policies have also interfered in the natural turnover within industries by reducing turnover among domestic firms, artificially protecting them from competition. The result is the nursing of "sick" industries and government purchase of grossly inefficient firms. The lack of "exit policy" for surplus labor makes firms retain workers that production capacity or product demand cannot support. Guaranteeing wages to workers who are unproductive due to oversupply of labor or lack of demand drains government resources. The system hurts business and government, but its greatest cost is to the workers who depend on it. The eventual collapse of the system will leave thousands of workers without wages, a dangerous social and political situation for India.

With MNCs already producing for export, Indian companies question the advantage of associating with MNCs, when the domestic market would be more lucrative. Quality standards set by importing countries for MNCs are not required of domestic producers, which lowers production costs and, along with the size of the domestic market, ensures profits based on quantity of goods sold, not necessarily on quality.

Indian infrastructure is not well developed for supporting FDI funded projects. Services are often be unavailable or incapable of supporting MNCs, as in the case of India's frequent power failures. The lack of consistent power can damage equipment, and is a major barrier to development of high technology industry, banking and communications. Although India is seeking technology transfer, India's poor protection of intellectual property rights discourages MNC investment in industries where process patents are common, and in the information industry, where India has the potential for world leadership. The government feels that although technology transfer is vital, it would conflict with domestic research and development (R&D). Evaluation of technology for transfer is impossible without in situ R&D. MNC affiliates did more R&D than local firms, yet liberalizing technology imports actually spurred local R&D to modify technology for local resources (Siddharthan, 1992).

The movement of FDI to lower technology sectors is an unintended side effect of tying FDI to technology transfer. Regulation of technology transfer from technically advanced industries causes MNCs to transfer older technology that is less valuable to Indian development. Without intellectual property protection, MNCs are reluctant to bring newer

BEST COPY AVAILABLE

technology into India, stalling modernization. Problems with intellectual property protection can lead to protectionism as well, as MNCs risk being denied market access for "Made in India" products. The US labor force, for example, was unprepared for the NIDL, and lobbied for restrictions on Indian imports. Discouraging Indian export production could invite retaliatory legislation against US MNCs in India and stall progress on intellectual property rights. The tension between the need for FDI and the lack of intellectual property protection shows how policies are in direct conflict with India's economic situation.

FDI AND INDIAN SOCIETY

As MNCs move into host countries, they interact with other cultures. Expectations of the consumer market must be examined according to consumption patterns rather than income distributions. Lower middle class consumers do not have the same income as those in WICs, yet their relative purchasing power is high. With an annual income of $700 to $1400, India's lower middle class buys 75% of radios and toilet soaps, 60% of laundry detergents, and up to 50% of color TVs, soft drinks, and shampoos sold. (Jacob, 1992) Strategic FDI in target markets takes advantage of India's socioeconomic diversity and growing consumerism. Liberalization not only stimulates FDI, but encourages consumer spending, and increased consumerism is fueling a rise in consumer credit, as India's financial sector opens to FDI. Credit companies see the large number of consumers as potential credit card holders. However, as in WICs, use of consumer credit can lead to defaults, which would stall economic development. Use of credit also puts new emphasis on the outlawed custom of dowry, which is reportedly on the rise. Dowry has been the source of systematic economic abuse of women and their families, even contributing to the practice of female infanticide. Although the availability of consumer credit might help women gain independence, increasing consumerism makes this unlikely.

Other issues involving FDI include inadequate environmental protection, hazardous working conditions, and the low status of women. One problem that has been ignored, is the rapid rise of HIV/AIDS infection in India which will have an impact on economic growth. One of the priority sectors for FDI is the hotel and tourism industry, which will be one of the most affected by the HIV/AIDS crisis. Economic growth is fueling the crisis, since spread of the virus parallels truck transport of goods from manufacturing centers. Economic growth will slow as the working population becomes debilitated, shrinking both labor force and domestic market. HIV/AIDS will strain health resources and drain government money away from the capital improvements necessary for continued involvement in the world economy. (Ghosh, 1996)

These factors may discourage FDI unless the Indian government acknowledges the problems and begins to deal with them effectively. Investing countries seek healthy venues for FDI, and India's enormous potential market and large supply of cheap labor may not offset the possibility of a host country crippled with political or social upheavals.

CONCLUSION

Although India has adopted export-oriented, outward looking policies, implementation has not been smooth. There is a lack of long-term political stability and a lack of political will for positive change. FDI may increase the money supply, leading to inflation, yet appreciation of the rupee could make exports less competitive. MNCs are distrusted as promoters of neo-colonial enterprises. Inefficient state-owned firms, and entrenched bureaucracy have a vested interest in delaying privatization. Asian regional competition encourages efficiency while unions try to protect inefficient firms. Strong export markets are vital to both Indian industrial policy and MNC profit. Trade restrictions on "Made in India" goods can cause retaliation by the Indian government. Indian firms with strong domestic markets are less likely to seek partnerships with export-oriented MNCs, shrinking available venues for FDI. Large tax breaks for foreign MNCs discourage Indian MNCs, which redirect inward investment to other countries. MNCs may leave if tax incentives are removed in government attempts to intercept profits. There is fear that MNCs will homogenize Indian culture. India's inexperience with laissez-faire capitalism has given MNCs great economic power, although the government believes it has control because it can withdraw reforms. Growing consumerism will not permit a return to import substitution. India is hoping to cure social and economic ills by embracing supply-side economics. yet it is unlikely that any benefits will "trickle down" through India's stratified society. What has actually reached the working poor is consumerism.

Despite ideological disagreements. political instability. environmental protection issues and human rights concerns. economic liberalization in India will continue to expand. Given the rapid growth of technology and the emerging importance of Asian regional markets. India has no other option. Intra-Asian FDI plays a crucial role in India's economic growth. but the question is whether that growth can be controlled. These problems must be resolved. since FDI could direct India away from post-colonial policies and towards a pivotal role in the world economy. By 2010. there will be over 1 billion people in India. whose government must not only define goals. but implement them in the nation's best interest. A few short years will not provide enough transition time for an economy ready for change. but burdened with enormous political and social challenges.

The Spatial Distribution of the Hispanic Population in the United States: An Analysis at Various Geographic Scales

Stephanie M. Sheetz

Department of Geography
Gustavus Adolphus College
800 West College Ave.
St. Peter, MN 56082-1498

Faculty Advisor:
Dr. Robert Douglas

The Hispanic population in the United States is steadily increasing, but is it becoming more spatially concentrated? This study sought to answer that question by first mapping the Hispanic population at various geographic scales and then quantitatively measuring its degree of concentration.
The spatial distribution is shown by a series of choropleth maps which display the percentage of Hispanic population at the national, state, county, city and census tract block group scales. The degree of population concentration is measured by the use of location quotients at each geographic scale. The results of the study show the spatial concentration of Hispanics in the United States both geographically and quantitatively.

INTRODUCTION:

During the past 30 years, more people have legally and illegally emigrated to the United States from Mexico than from any other nation. Between 1960 and 1980, the Mexican population in the United States grew from 2.3 million to 8.7 million. By the year 2010, the Mexican population in the United States is projected to reach 40 million (Gutiérrez xvii). As a result, both interest and national concern have risen about the Mexican population in the United States.

The Mexican population trends are a direct result of the history between the United States and Mexico. There have been several periods of large-scale Mexican migration, which continue today with the increasing demand for rural and skilled workers. A 1991 nationwide survey of farm workers showed that 90 percent of the 73 percent foreign born workers in US crop production were Mexican. Mexicans currently comprise about four percent of the United States labor force.

The close ties the labor market has with Mexico do not show any hint of reducing demand for Mexican labor. In addition, the close proximity of the two countries provides easy access for those Mexicans pursuing a better standard of living in a country more developed than Mexico. Where are these migration trends? This study shows the areas of the United States that have higher spatial concentrations of Mexicans.

METHOD:

The 1990 Census of the General Population was the primary source used to study the Mexican settlement in the United States. Data were taken from the census information on the Hispanic population at the state, city, county and census tract level. The Hispanic population was divided into subsets, for example the Mexican, Cuban or Puerto Rican population at the state, city and census tract levels. However, at the county level, data was available only on the more general level of Hispanic population.

The study focuses on the spatial location of Mexicans in the United States. The first part is an analysis at the national level. First a table of the Mexican population and the total population for each of the 51 states was made. From this table, percentages of Mexicans in each state were calculated. Another quantitative analysis included calculating the spatial location quotient of Mexicans for each state. Below equation 1, using Texas data, gives a sample calculation of the location quotients calculated. To find the spatial location quotient, one must first take the Mexican population of the state (3,890,820) and divide it by the total Mexican population in all the states (13,495,938). Then divide this by the quotient of the total state population (16,986,510) divided by the total nation's population (250,709,873).

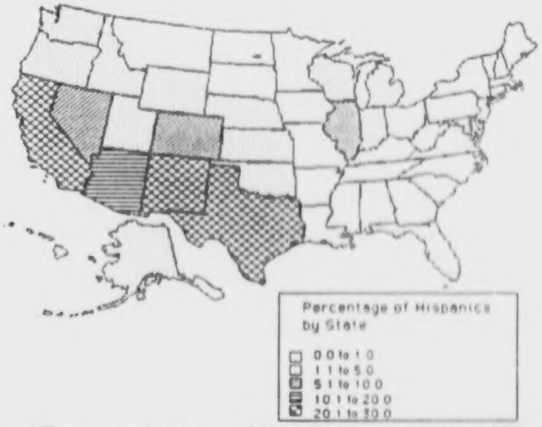
$$\frac{\left(\frac{3890820}{13495938}\right)}{\left(\frac{16986510}{250709873}\right)} = 4.26 \qquad (1)$$

The location quotient analyzes the degree of concentration of a population, indicating high or low population density. Table 1 lists the five states with the highest percentage of Mexicans and their location quotients. Map 1 is a choropleth map showing the distributions in the United States.

Table 1: Mexican Populations in Top Five States

States	Population	# of Mexicans	% of Mexicans	Location Quotient
Texas	16,986,510	3,890,820	23	4.26
New Mexico	515,069	328,836	22	11.9
California	29,760,021	6,118,996	20.5	3.82
Arizona	3,665,228	616,195	16.8	3.12
Colorado	3,294,394	282,478	8.5	1.59

Map 1: Mexican Population in the United States

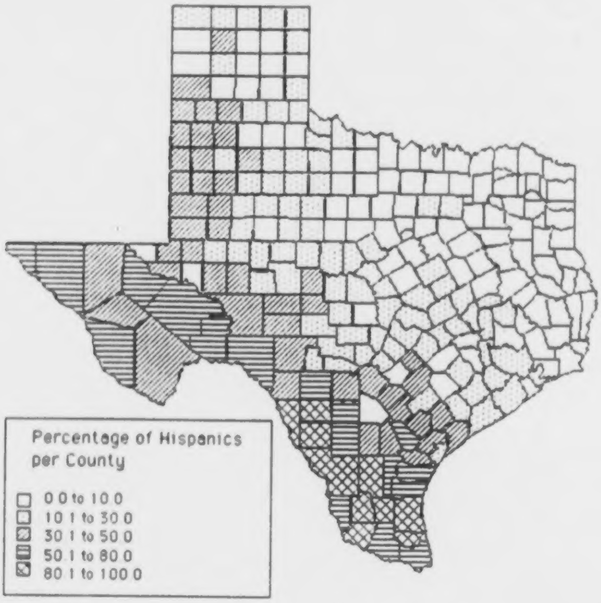


Because Texas was the state with the greatest percentage of Mexicans, the next study was on the spatial concentration of the Mexican population in Texas, by county. Again, calculations of both percentages and location quotients were made. A summary of the counties with the greatest percentages and location quotients is shown in Table 2. Map 2 shows the spatial concentration

Table 2: Hispanic Population in Top Five Counties

County	Population	# of Hispanics	% of Hispanics	Location Quotient
Jim Hogg	5,079	4,659	91.7	3.74
Brooks	8,187	7,338	89.6	3.65
Duval	12,721	11,267	88.6	3.61
Zavala	12,306	10,875	88.4	3.60
Starr	44,953	39,390	87.6	3.57

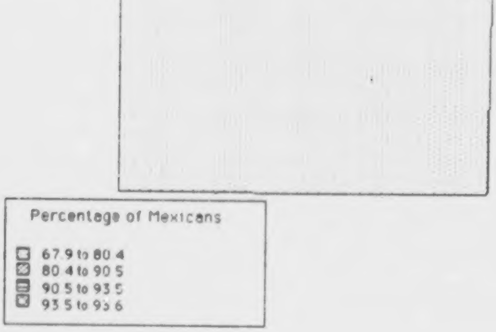
Map 2: Mexican Population in Texas



Percentage of Hispanics per County
0.0 to 10.0
10.1 to 30.0
30.1 to 50.0
50.1 to 80.0
80.1 to 100.0

Last, an analysis of the settlement pattern of Mexicans at the county and city level were made. The county with the greatest percentage of Hispanics, Jim Hogg county (Map 3), was mapped according to census tract blocks.

Map 3: Mexican Population in Jim Hogg County



Hebbronville
Percentage of Mexicans
67.9 to 80.4
80.4 to 90.5
90.5 to 93.5
93.5 to 95.6

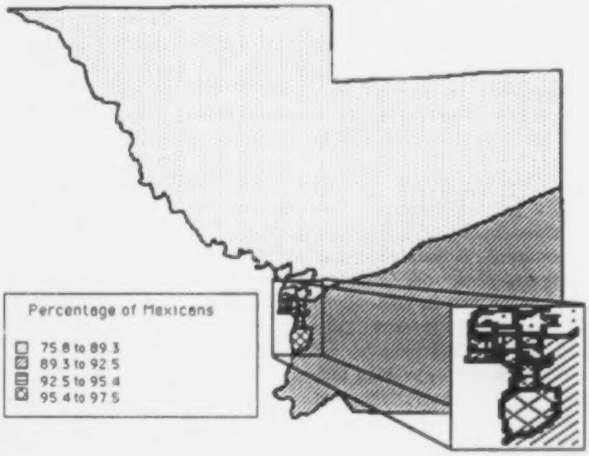
Next, using the 1990 census data each of Texas' cities with a population exceeding 50,000 persons was analyzed. Table 3 shows the five cities with the greatest percentages.

Table 3 Mexican Population in Top Five Cities in Texas

City	All persons	# Mexicans	% Mexicans	Location Quotient
Laredo	122,899	109,796	89.3	3.30
Brownsville	98,962	84,448	85.3	3.16
McAllen	84,021	61,206	72.8	2.69
El Paso	515,342	338,844	65.8	2.43
San Antonio	935,933	478,*409	51.1	1.89

Map 4 is Webb County. The enlarged area is of the census tract block groups for Laredo City, the city with the greatest spatial concentration of Mexicans. The city is magnified in order to show the individual census tracts.

Map 4: Mexican Population by Census Tract for Laredo, Texas



RESULTS:

As listed in Table 1, the Mexican population concentrates heavily in the Western region, including the states of New Mexico, California, Arizona and Colorado. However a large concentration was also found in Texas, a state in the Southern region. When analyzed by degree of concentration, the Western region has a very high location quotient, 2.29. On the location quotient scale, any number higher than 1.0 indicates a heavy population concentration.

The spatial concentration of Hispanics in the counties of Texas tends toward a higher concentration in the Southwestern portion of Texas than the Northeastern part of Texas. A regional analysis of Texas shows the Southwest has a high location quotient of 1.64 whereas the Northeast is .63.

A deeper analysis of the population density is done in the study of Jim Hogg County. Each census tract block group has high location quotients. Even though none reach 1.0, all are above .6. This again indicates high concentrations of the Mexican population. The greatest Mexican population density is near the town of Hebbronville (see Map 3)

The most specific level of analysis was the concentration of Mexicans within a city. The location quotient for Laredo indicated a very high density of Mexican population. Within the city, the census tract location quotients ranges differ very little, only by .24. The highest quotients were in census block group numbers 5 and 13, located in the downtown area (most likely the Central Business District). In general, the census tracts with the greatest location quotients and percentages are located either in downtown Laredo or in the southern part of the city.

CONCLUSION:

The spatial analysis of the Hispanic population in the United States shows similarities in all levels of geographic study. As stated in the results, the spatial location of Mexicans tends to be in the southwestern and western regions of the United States (Map 1). This trend continues through the national, state, county and city level. Texas shows high percentages of Mexicans in the Southwest region (Map 2). The city of Laredo demonstrates this as well, with percentages greatest at the location closest to the Mexican border. The trends shown by the spatial analyses and also the quantitative analyses are fairly uniform and expected.

Although the results are predictable, there are still sources of error in the study. The study was limited to the spatial analysis of Mexicans. Data in the 1990 Census listed Mexicans under the general heading of Hispanics. There is a level of uncertainty in the population data due to the census questionnaire. The Census used a self-identifying question in which people of Spanish/Hispanic origin classified themselves in one of the given categories: Mexican, Puerto Rican, Cuban or Other Spanish/Hispanic origin. Also, at the county scale of study, information on the Mexican population was not available. As a result the county scale analysis uses Hispanic population information. Second, the census information does not specify it is a census of the total population, legal and illegal immigrants. The assumption was that the census documented only legal residents, yet the status of the Mexican is very important to a simple study of spatial location.

Mexico is a border nation to the United States. Therefore, this study is significant by showing exactly where the immigration trends are occurring with the most frequency. It suggests that a greater pull factor than jobs is geographical proximity. It is obvious many Mexicans migrate and immigrate into the United States every year. This study shows that among the 51 states, Texas is the most preferred. In Texas, Jim Hogg is the preferred county of Mexican settlement. At the city scale, Laredo is favored over all Texas cities. The reasons for Mexican migration vary greatly, however predicting the spatial location is fairly easy once the general trends are known. Mexican groups are concentrated in locations closest to Mexico.

A Quantitative Study of Communication Apprehension and Self-Esteem

Mattie Marie Butler

Department of Communication

Bowie State University
Bowie, Maryland 20715

Faculty Advisor:
Dr. Abdul Karim Bangura

This study investigates whether there is a correlation between self-esteem and communication apprehension. (CA). The forces is on the processing posits that individuals with high communication apprehension and individuals with low communication apprehension have in common. It is designed to explore the participant's reasoning for feeling and/or fear when communicating. The major findings in this study suggest that individuals with high levels of CA are less competent, and have lower academic success; individuals with low levels of CA are more competent in general, more communicatively competent, less anxious about communication, more composed, and more extroverted.

INTRODUCTION

The development of Communication Apprehension (CA) theory was the brainchild of McCroskey (1970). As the Chairperson of the International Division of the ICA, McCroskey with his colleagues did a study to find out how Communication Apprehension can affect individuals.

McCroskey (1970) defined Communication Apprehension (CA) as "a broadly based anxiety related to oral communication" (Infante, Rancer & Womack, 1993). This definition was expanded in future (subsequent) work to an individual's level of fear or anxiety associated with either real or anticipated communication with another person or persons (Infante, Racer & Womack, 1993). These over-reactions include trembling, difficult in swallowing, or temporary loss of memory (McCroskey, 1970), resulting from a physiologically over-reaction to an event.

Individuals with CA seem to possess some general characteristics. They tend to (1) be afraid of giving wrong answers and of receiving any type of evaluation; (2) focus on the correctness of the material; (3) feel that they do not have the ability to control themselves and the environment in which they are to speak; (4) be anxious about reading aloud; (5) feel emotionally unprepared to talk; (6) be unable to organize their thoughts and ideas; and (7) be unable to figure out rhetorical strategies for dealing with their audience (Berko, Wolvin & Wolvin, 1992, p. 95). Berko et al. (1992) estimate that eighty percent of the people in the United States confess to being shy as opposed to about seven percent of the people in the United States who have never felt shy. Berko's study also indicated that virtually one hundred percent of the people in the United States experience communication apprehension from time to time, and about ninety-five percent of the population reports having apprehension about communication with one person or group in their lives (Berko et. al., 1992).

There are several categories of CA: Traitlike CA, Context-Based CA, Audience-Based CA, and Situational CA. Traitlike CA is the stable degree of anxiety experienced by an individual across communication contexts, "such as" meetings, lectures, social and public speaking gatherings (Infante et. al., 1993). This type of CA is not such a debilitating condition that it would cause the speaker to communicate ineffectively. Traitlike CA has been the major focus of empirical research because it deals with a wide spectrum of personalities.

In Context-Based CA, time and context are the factors which influence the speaker's anxiety. This applies to individuals who may be comfortable speaking in certain settings, but not in others. For example, an individual may feel uncomfortable communicating to a person on an individual bases but not before a group. Another example is a graduate student who may be comfortable speaking before his classmates but experiences anxiety when speaking before a large seminar at his/her workplace.

Audience-Based CA is the fear experienced when communicating with certain types of people. Unlike Context-Based CA, the fear is experienced regardless of time and context (Infante, et. al., 1977). The presence of a particular audience member would cause anxiety in the speaker. An example could be a person who is confident speaking before large audiences, but when a pivotal figure (such as a parent) is present, the speaker could exhibit this type of CA.

Situational CA refers to the degree of fear encountered in communicating with a given person or persons in unique situations. This type of CA is caused by variables unique to a particular circumstance (Infante, et al., 1977). For example, an employee may rarely feel anxiety when called upon to speak in front of a large crowd and gives a superior performance.

RESEARCH METHODOLOGY

The research methodology employed for this research is quantitative. The theory that guides this study is the communication apprehension approach. This is tested on college students who both have high and low levels of CA. The hypothesis of this study is the following:

> H1: There are similarities and differences in self-esteem levels of both high CA students and low CA students.

This study is a micro level analysis in the sense that the unit of analysis is a convenient sample of 98 students at Bowie State University, University of Maryland at College Park, and Towson State University. The research design employed is a one group posttest only design. The basis of this design is a single post-treatment observation for the impact of communication apprehension. It can be diagrammatical stated as:

$$X\,O1 \quad [1]$$

where O1 is the observation or measure of communication apprehension and X is the level of communication apprehension itself.

The Survey Instrument employed for this study is McCroskey's Personal

Report of Communication Apprehension Questionnaire. This Instrument has 24 Statements dealing with communication Apprehension Issues (See Table !). The validity of this instrument hinged on thorough backgrounding, including contact with knowledgeable experts and intimate knowledge of existing research.· To ensure the reliability of the instrument, a sample of 10 of the students interviewed were again probed, and the same information was obtained as before.

DATA ANALYSIS

The data for this study were analyzed in one stage: univariate. The computer package that was used to compute the data for this study is called GB-STAT. The statistics used is the percentage, which is very useful for descriptive purposes. The results generated from the computer runs of the data for the univariate stage are summarized in Table 1.

As can be gleaned from Table 1, the Likert-Scale responses have been collapsed into three categories to facilitate ease in analyzing the data. This decision was based on the fact that an overwhelming majority of the responses for all the statements in the Personal Report Communication Apprehension instrument used were heavily skewed toward either strongly agree or strongly disagree. Also, it can be noted that the number of respondents who were undecided is relatively negligible.

Table 1 further shows that except for the first two statements ("I dislike participating in group discussions" and "Generally, I am comfortable while participating in group discussions") which have about four-fifths of the respondents agreeing and strongly agreeing with almost all of the rest of the respondents disagreeing and strongly disagreeing, the other twenty-two statements have about two-thirds of the respondents agreeing and strongly agreeing and almost all of the rest of the respondents disagreeing and strongly disagreeing. What is quite evident from the responses is that while about two-thirds of the respondents appear to have low self-esteem and communication apprehensive about getting involved in various communicative events (conversations, meetings, giving speeches) in the initial stages of these events, they tend to develop their self-confidence once the events progress. However, for about one-third of the respondents, their self-esteem and communication apprehension do not diminish even after they are already engaged in a communicative event. Therefore, the hypothesis posited in this study, H1: There are similarities and differences in self-esteem levels of both high CA students and low CA students, can be accepted.

What the results seem to indicate is that people with low self-esteem and communication apprehension seem to expect to be rejected by others. They also appear to think that they will perform poorly when being watched: sensitive to possible negative reaction. Characteristics like these make sense when one realizes that people with low self-esteem and communication apprehension are likely to believe that others won't like or respect them. Realistically or not, they imagine that others are constantly viewing them critically, and they accept these imagined or real criticisms as more proof that they are indeed unlikeable or unrespectable people. To use the well-known terminology of psychiatrist Eric Berne, they adopt an "I'm not OK--you're OK" orientation to life. Sometimes this low self-esteem and communication apprehension are manifested in hostility toward others, since the communicator takes the approach that the only way to look good is to put others down.

Table 1: Personal Report of Communication Apprehension (PRCA-24)

Statement	Agree and and Strongly Agree	Undecided	Disagree Strongly Disagree
1. I dislike participating in group discussions	79%	1%	20%
2. Generally, I am comfortable while participating in group discussions	84%	3%	13%
3. I am tense and nervous while participating in group discussions	66%	12%	22%
4. I like to get involved in group discussions	67%	11%	22%
5. Engaging in a group discussion with new people makes me tense and nervous	73%	6%	21%
6. I am calm and relaxed while participating in group discussions	66%	4%	30%
7. Generally, I am nervous when I have to participate in a meeting	66%	5%	29%
8. Usually, I calm and relaxed while participating in meetings	65%	3%	32%
9. I am very calm and relaxed when I am called upon to express an opinion at a meeting	68%	5%	27%
10. I am afraid to express myself at meetings	64%	7%	29%
11. Communicating at meetings usually makes me uncomfortable	71%	7%	22%
12. I am very relaxed when answering questions at a meeting	64%	10%	26%
13. While participating in a conversation with a new acquaintance, I feel very nervous	71%	9%	20%
14. I have no fear of speaking up in conversations	61%	5%	35%
15. Ordinarily, I am very tense and nervous in conversations	73%	5%	35%
16. Ordinarily, I am very calm and relaxed in conversations	64%	6%	30%
17. While conversing with a new acquaintance, I feel very relaxed	67%	5%	28%
18. I'm afraid to speak up in conversations	64%	8%	28%
19. I have no fear of giving a speech	60%	10%	30%
20. Certain parts of my body feel very tense and rigid while I am giving a speech	61%	12%	27%
21. I feel relaxed while giving a speech	65%	7%	28%
22. My thoughts become confused and jumbled when I am giving a speech	64%	10%	26%
23. I face the prospect of giving a speech with confidence	67%	3%	30%
24. While giving a speech, I get so nervous I forget facts I really know	62%	10%	28%

CONCLUSION

As the preceding discussion reveals, about two-thirds of the respondents appear to have low self-esteem and communication apprehension in the initial stages of communicative events; However, they tend to develop their self-confidence once the events progress. For the remaining one-third, their self-esteem and communication apprehension does not diminish even after they are already engaged in a communicative event.

The limitation of this study has to do with the fact that surveys, like the one employed for this study, usually ask people to describe their own behavior in relation to others. Consequently, self-reporting is grounded in self-perception. Accounts of behavior may be accounts of how people think they should behave. As such, their reported behavior sometimes is more "Should Be" Than "Is."

Evansville, Indiana 47722

Faculty Advisor:

Dean Thomlison., Ph.D.

The purpose of this study was to discover what major factors influence attraction in Computer-Mediated Communication. Reviewing past attraction research, a survey was devised including both traditional factors and the newly integrated cyberpersonal factors. The survey was intended to inform the researchers about attraction factors involved in internet relationships. These relationships included both the romantic and non-romantic. Subject anonymity was assured with the omission of the participant's return address when the survey was completed and returned. Approximately seventy-five internet users, both male and female, completed the survey asking about their involvement in computer-mediated relationships. Eight major factors were studied in the experiment: physical attraction, shared interest, proximity, moral structure, humor, intellect, age, and lack of touch. Using a block-sample study, the survey was analyzed and measured according to the intensity of the different factors involved. Conclusions were drawn regarding the primary factors involved in attraction in Computer-Mediated Relations and were compared to traditional Interpersonal attraction in relationships.

BACKGROUND

Since the dawn of computers, the information superhighway is rising at neck-breaking speed. Internet cyberspace is one of the fastest-growing forms of communication in the world. If one can talk to friends and business associates through his/her laptop computer, then why isn't it possible to meet one's soulmate? The days of wondering what to wear on a date are over. Now the only device one may find handy is the thesaurus for inventing witty advice and a can of Pepsi to keep you typing into the long hours of cyberspace--a world that keeps no clock. Eye-to-eye contact is lost, beauty is now in the hands of the typist rather than the eyes of the beholder. This research examines the differences between the primary elements of attraction in interpersonal and cyberpersonal contexts.

Attraction has always been a much debated subject among researchers. Attraction is based on several factors, one of which is physical attraction. Many studies have demonstrated that individuals view themselves as "more similar in interest and beliefs to physically attractive others than to unattractive others" (Marks & Miller, 1982; Marks, Miller & Maruyama, 1981). In a study completed by Miyake & Zucherman (1993), the physical and vocal attractiveness of the participants were measured and how view of self affected the interaction with others. The study showed that physical attractiveness appeared to be a more important factor than vocal attractiveness. Miyake & Zucherman also found that participants were aware of their physical attractiveness, and yet not aware of their vocal attractiveness. Another series of traditional interpersonal studies concluded that those in closer proximity to one another were more likely to be attracted to one another (Duncan, 1969; Levinger & Gunner, 1967; Little, 1965; Mehrabian, 1968). According to Byrne (1971), liking and similarity (attitudes, beliefs, likes/dislikes, etc.) are both strong influencers on attraction. Several researchers (Burleson et al., 1994; Burleson & Denton, 1992; Burleson et al., 1992) have proposed that "some types of similarity act not to validate another's cognition, but rather to enhance the quality of interactions and make them more enjoyable."

The traditional approach to interpersonal attraction tends to stress that proximity, physical attraction, similarity, personality, and touch are important factors involved in attraction. Similarity has always played a major role in personal attraction. (Adler and Towne, 1993). These attractive similarities include beliefs, attitudes, communication values, and likes/dislikes. Research has also suggested that similar personality traits have been attributed to greater personal attraction (Adler&Towne). According to Reid (1991), other factors of attraction exist in CMC. Other attraction factors might be fast typing, wit, and speed of response.

As noted above, being able to visually assess the individual has a large impact on how participants relate their own personality. In an article entitled "Computer-Mediated Communication," (CMC) Joseph Walter, states a similar idea. Since people are not aware of their partners' physical features in CMC, a "selective self-presentation" occurs. "This 'selective self-presentation' involves proof-reading your e-mail or newsletter before sending it out, while in face-to-face interaction people do not have that extra time to carefully select their words. Because of this difference in time, people increased their ability to censor themselves. This is mainly for asynchronous communication over the internet." Asynchronous communication is communication which does not occur simultaneously or concurrently, for example using electronic mail.

Physical attractiveness does not exist in Computer-Mediated Communication, except in video or photographs. Malcolm R. Parks, in his study on "Friends in Cyberspace", states that "no theory of relational development explicitly requires physical attractiveness as a necessary condition for development". In fact, Parks goes on to say that "while physical attraction is rewarding (e.g., Berscheid & Walster, 1978; Hatfield & Sprecher, 1986) it is only one of many rewards needed for a healthy relationship to start or continue." Chesebro and Bonsall (1989) admit that Computer-Mediated Communication is still lacking in aspects of communication compared with traditional interpersonal relations, but still support the validity of internet relationships as a whole.

One of the main reasons it seems people are attracted to others over the internet is the same reason face-to-face partners are attracted to each other. Elizabeth Reid (1991), asserts Internet Relay Chat (IRC) users share a "common language, a shared web of textual significance that substitutes for and yet is distinct from the networks of meaning of a wider community. It is this shared vocabulary and understanding that characterizes the networks as a unique and distinct culture" (Reid, p.39).

Humor and typing may also perform important roles in internet relationships. Reid (1991) asserts, "speed of response and wit are the stuff of popularity and community on Internet Relay Chat. A person who can succinctly and graphically portray themselves to the rest of the IRC usership will be most able to create a community within a virtual system."

Physical touch is very important way of communicating emotion between individuals. Although many researchers have stated that physical intimacy is very important to relationship development, cyberpersonal relationships are characterized by a lack of physical contact. Chesebro and Bonsall acknowledges this void of contact when they state: "they lack the physical intimacy of face-to-face friendships, but computer friends, in our view, will function as powerful psychological relationships at least equal in the importance to many face-to-face contacts" (1989). Face-to-Face communication involves dimensions of contact such as touch. It is noted that lack of these dimensions are overcompensated for in Computer Mediated Communication. "For instance, it has been noted that people use informal and expressive language and familiar slang to diminish the indifferent social relationship created by a computer connection" (Chesebro, 1989).

Proximity becomes another important factor when dealing with cyberpersonal relationships. Walther's (1992, 1993) information-processing perspective says that people in on-line settings may simply take longer to reduce their uncertainty about one another. The lack of proximity and of visual information might be overcome by arranging meetings or by exchanging photographs either electronically or by mail.

METHODOLOGY

In response to past interpersonal and Computer-Mediated Communication research completed attraction factors, a self-devised survey was constructed in order to determine what attraction factors were prevalent in Computer Mediated communication. The general survey consisted of 39 questions, including a working definition of a relationship and attraction. The survey has two parts; one is a demographics stage. Age, gender, and marital status were recorded in order to indicate trends within the statistical analysis. Twenty-five of the survey questions were included and answered on the basis of a seven point Likert scale. The scale indicated the intensity of the answers regarding the Internet relationship, this making up the second part of the survey. A comment section was also used for the participants to include their suggestions for improvement. The section allowed space for voicing concerns and questions about the research project at the conclusion of the three page survey. The survey was conducted over various Internet means including newsgroups, chatlines, and bulletin boards. A page was made for the World Wide Web to distribute the survey to a variety of internet users. The survey's address is http://pinncomp.com/attract/ and is still on-line. The Web page address was distributed to newsgroup, chatlines, and e-mail addresses. A total of 61 surveys were collected with the average age group of the participants being between 22 and 30. Thirty males and 31 females participated in the study. Because the participants were volunteers, a true random sample study was not possible. The survey was analyzed and measured using a Pearrson's Correlation Matrix and a block-sample study, according to the intensity of the different factors involved.

RESULTS

Much of our findings correlate with past research collected on attraction over internet relationships. Using the questions pertaining to the Likert scale, we computed the number of participants who felt particular characteristics are important in determining attraction factors. High factors were ascertained by determining the frequency of respondents who reported a 3 or less on the Likert scale questions of the survey.

The most significant finding was the importance of the partners being attracted to the other's intellect. A total of 53 respondents out of 61 rated this factor as significant. Question pairs determining intellect were included in the survey. These sets were compared using a Pearson correlation matrix in order to determine internal validity of the questions. The internal validity of the questions measuring intellect, was proven by the probability errors totaling less than ($p < .05$).

The second most important attraction factor for the survey participants was mutual interest attraction. For many internet participants, interaction takes place commonly among chatlines and interest-related newsgroups. As many as 51 participants rated mutual interest as important when meeting another over the computer. Pair validity was also determined with the p value. An interesting finding asserted that as shared interest between partners increased, so did physical attraction . ($r=.443$)

Participants also felt that an even intellectual level is extremely important in internet relations. Finally, the high scores of increased attraction basis included similar levels of commitment, and whether or not the internet partner makes the participant feel that the partner was supportive of life decisions. Fifty respondents out of 61 related a high association on the importance of the supportive level of their partner. These two attraction factors showed similar correlating positive trends. As the partner was perceived to be supportive of decisions, the physical attractiveness between the partners intensified.

Age trends show that there is a significant correlation ($r=.739$) between the age of the participant and the age of the partner. Face-to-face communication takes into consideration age as an attraction factor. Another interesting age correlation involves the significant impact the importance of age has on the importance of truth in a relationship with a correlation of ($r=.600$). Through the use of the Pearson Correlation Matrix, it was determined that Computer Mediated Communication shows a similar trend.

In contrast to previous research studies on physical attraction relating to traditional interpersonal approaches, the study indicated that physical attractiveness did not play a large role in assessing attraction factors. Less than half of the respondents (48%) replied that they were significantly physically attracted to his/her partner. Similarly, 70% of the respondents indicated that s/he is more interested in partner's personality than their physical appearance.

Another low factor rating was proximity. Asking them to rate the satisfaction of the relationship on a 1-10 scale (1 as least satisfactory, 10 as most satisfactory), it was found that those who were closer in distance were not necessarily more satisfied with their relationship, as hypothesized earlier. Fifty-seven percent (or 35/61) of the surveyors stated that they were more than satisfied with their relationship in general, giving the question a level number of 7 or above. See Figure 1 for tabulated results.

DISCUSSION

The findings of this survey relay many possibilities about factors that cause people to be attracted to one another in cyber-interactions. Because cyber-communication is so new to household technology, much information remains to be found. Some of the possible conclusions of our research only prove that more studies are imminent in the future.

Traditional interpersonal attraction factors, whether romantic or non, involve sometimes subtle verbal and nonverbal cues. For centuries, mankind has sought to pinpoint these cues in order for communication to improve between people. With the invention of technology-induced cyber and internet communication, these cues become more complex.

The results suggested that many of the factors in face-to-face and cyber communication are similar. the phases of meeting one another in the relationship process are different (namely, lack of physical contact). However, once initial contact is made, the attraction factors that are decision makers in the continuation or termination of the relationship are similar. The most important factors in both processes seem to be: shared interest, age, personality, and supportiveness of the partner in decision making. The only main deviations from traditional communication that play important roles are the factors of physical attractiveness and proximity. Latter factors may be determined after the first face to face contact is initiated.

Some possible source of error may include: truthfulness of participants in the study, lack of random sample due to the nature of volunteers participating in the study, and methods of error from the survey itself. Various participants went beyond the limited numbers in rating various factors in their relationship. Many possible errors were suggested after the survey was distributed. As this study is a continuing process, we feel that some of these error sources may be avoided in the future. Gender bias may be disproved surprisingly due to the natural balance of the male/female ratio (31 males, 30 females). Because the majority of our surveyors were at college-age level (18-24), age bias could be a factor in the attitudes attributed to the completion of our survey as well.

Reid's study suggested typing as well as Computer Mediated Communication skills play an important role in attraction over the internet. The survey responses that were collected in this study suggested differently. Typing and spelling rated in the lowest categories of interpersonal attraction. Given the conclusions of this research in comparison to research of the past, this "testing of new ground" offers many insights into possibilities for future research. These findings also give further knowledge of attraction factors involved in internet relationships.

Future studies may include: self-esteem related to frequent internet communicators, how important self-description is in furthering internet relationships, education and the importance it plays among relationships, and how quickly internet participants meet face-to-face after initiation. Other communication research may concentrate on the specific areas of internet attraction such as proximity or the factor of touch and satisfaction. Because the world is relying more and more on cyber-communication, it will be interesting to see where further knowledge and research lead us in this fast-paced technology.

Wartime Benevolence: A Portrait of Northern Philanthropy During the Civil War

Kevin Davis

Department of History
The University of North Carolina at Asheville
One University Heights
Asheville, NC 28804-3299

Faculty Advisor: Bruce S. Greenawalt

When the French observer and critic of American democracy Alexis de Tocqueville traveled the United States in the 1830's, he was struck by the American brilliance for voluntary societies, particularly in the Northern states.[1] What made America's voluntarism unique was its organizational nature. Before the outbreak of the Civil War, American society was largely characterized by an elevated degree of citizen involvement in national matters. Americans were steadfastly concerned with issues such as women's rights, slavery, poverty and health care. The same type of meticulous, even fanatical attention was given to the issues of the Civil War.

Most northern citizens who did not serve in the military believed they should improve the war effort in some way other than battlefield heroics. Ties of family and friendship to Union soldiers may have provided a substantial portion of the citizenry's motivation to participate in benevolent associations. The Union army, after all, consisted of the husbands, brothers, sons, uncles, nephews, and cousins of the homefront's citizens. Moreover, those who were involved with voluntary organizations during the Civil War derived a great dignity and honor from their efforts of benevolence. It was usually women, the wives, mothers, sisters, cousins, and aunts of their beloved men in blue, that participated in such benevolent societies. It was not unusual for women of all countries to voluntarily assist those suffering because of war. What made the American women different is that they organized relief.[2] To be sure, the first few weeks of their patriotic activity reflected more of a zealous fanaticism than a practical plan. But what eventually emerged was a diverse collection of passionately efficient benevolent organizations. The multi tiered voluntaristic structure that evolved was testament to the ability of groups and individuals to negotiate the complex and harsh demands of a war.

The attack on Fort Sumter on April 12, 1861 spelled war between the states. President Abraham Lincoln initially summoned 75,000 troops to thwart the uprising. The health and welfare of this fast gathering host of Northern troops had aroused much anxiety. Small groups of women in various cities formed societies to supply nurses, to purchase clothing, medicines, and comforts for the sick and wounded. The first soldiers' aid society appeared at Bridgeport, Connecticut. Similar organizations soon surfaced in towns such as Charleston, Massachusetts and Cleveland, Ohio, forming what would become a large and thriving network of aid societies.

Reverend Dr. Henry Whitney Bellows, minister of the All Souls Church Unitarian in New York, was especially interested in relieving soldiers in camp and field. Without direction and a clear idea of common goals, Bellows noted that the devoted women of the northern homefront might have wasted their energy and produced more harm than good from their zeal. Bellows was interested in giving these women's enthusiasm a much needed focus. Bellows and a well-known physician, Dr. Elisha Harris, met accidentally in a New York street and discussed the general question of military sanitation and health. They talked and discussed the issue with others. Bellows subsequently sent out a call for a general meeting at Cooper Institute to deal with the work of relief in the army. After several conferences, Bellows drafted a constitution of what became the Women's Central Association of Relief. Bellows met no opposition in calling the Association to order as nearly one hundred of New York's most influential women signed his initial address.[3]

Relief to Union soldiers was surely needed at this time. Never before had the issue of mass hygiene confronted America with such urgency. Essential to good health was nutritious food, fresh air, clean water, proper clothing, and adequate shelter. Upon entering the army, most soldiers rarely received any of these things. More often than not, the soldiers' rations were poorly cooked and served without cleanliness. And almost never did they have the luxury of sleeping in a warm, uncrowded tent on dry land. For Bellows, the answer to the American sanitation problem would be found within a large sanitary commission that would pick up the slack of the stumbling Medical Bureau.

The initial objective of the United States Sanitary Commission was to aid struggling soldiers until such time the Medical Bureau could handle the task on its own. But at no point was the Medical Bureau equipped to perform this task properly. The Sanitary Commission that responded to these problems was to exist in a form that did not supplant other governmental agencies. Sanitary Commission administrators made a concerted effort to keep it subordinate to army rules and regulations. Acting surgeon general R.C. Wood advised that, "This commission is not intended to interfere with, but to strengthen the present organization."[4] Although this was their intent, relations between the Sanitary Commission and Medical Bureau were turbulent at best. Throughout the course of the war, the Sanitary Commission would express very little patience with the inadequate fashion by which the Medical Bureau operated hospitals, transportation, lines of communication and the handling of supplies.

USSC inspectors, who were usually medically qualified in some way, assessed the quality of many things in and around the battlefield. These inspections covered things such as rations and water, camp cooking, ventilation of tents and quarters, drainage of the camp, administration of the hospital, quality of the tents and the materials used for flooring them, soldiers' clothing, and the personal cleanliness of the men.[5] What the USSC's inspectors found was not good. During late 1861, the USSC inspected over 200 regiments in the Union Army and found that 58 percent of them had no thorough system of inspection of their recruits on enlistment. With such a loose system, droves of weak and unable men entered the army. Furthermore, men with more defined maladies such as hernia, varicose veins, tuberculosis, and syphilis were allowed to march into war.[6] Most of these weak, substandard soldiers would break down during the war, subjecting the already overcrowded hospital system to further strains.

To remedy these ailments of the Union Army the USSC quickly mobilized its many volunteer workers who ran its 7,000 local auxiliaries. These auxiliaries collected water and clothing and organized sanitary fairs to raise money for the Commission. The Sanitary Commission's next step was to dispense these goods. The Commission did so by building depots for the distribution of clothing, food, and medicine to the army. USSC inspectors who were sent to regimental camps provided instruction and advice on matters such as water, cooking, and drainage. The USSC further supplied soldiers with vegetables that were usually absent in the basic army ration. The Commission also collected emergency inventories of bandages and medicine which were rushed to battlefield hospitals as they were needed. The Commission even chartered ships to evacuate the wounded and provided ambulance services to replace the army's insufficient system of patient transportation.[7]

The methods the USSC used to raise funds for the purchase of their supplies and their distribution are largely reflective of the organizational nature of the USSC. Funds were collected by the many dedicated women of the North. These loyal, female patriots organized more than ten thousand "aid societies" over the course of the war. Funds were constantly and consistently raised during every year of the war. Branches of the USSC were established as quickly as possible in Boston, New York, Philadelphia, Cincinnati, Chicago, and other cities. In these cities, sub-depots of sanitary stores were kept up, receiving the endless contributions of the soldiers' aid societies. The items sent to these sub-depots were assorted, repacked, and stamped with the seal of the Commission. The boxes of supplies were then put into storage, subject to the requisitions of the central distributing depots at Washington and Louisville. From these two cities, supplies of every kind were dispensed to Union troops who desperately needed them. The reception and care of these hospital supplies followed a very strict and meticulous system. This system was configured in such a way that it was easy to trace packages sent to hospitals back to their original contributors. The USSC took vouchers from every person that received the supplies at every stage of their progress until their ultimate destination was reached. The efficiency of this system was so great that only a small fraction of the supplies was lost or mishandled.[8]

The soldiers' aid societies were illustrative of how women made voluntary activities a staple of their wartime lives. The Sanitary Commission was, in fact, the main avenue by which women participated in the war. In any given week, an unmarried woman might spend an evening at a soldiers' aid society meeting, an afternoon reading to soldiers at a nearby hospital, and several more evenings visiting the wives of men who had enlisted in the Union Army.[9] While others were less involved, most of the North's citizenry were always prepared to give assistance after a major battle or during a crucial fund-raising event.

The USSC was, by far, the most outstanding and effective of all benevolent volunteer organizations. Under the direction of Henry Whitney Bellows as its president and Frederick Law Olmsted as general secretary, the USSC raised millions of dollars and channeled the voluntary efforts of hundreds of small groups into the distribution of great quantities of food, medicine, clothing, and innumerable hospital services. Although some soldiers complained about the USSC's partiality to army officers, the Commission cannot be faulted.[10] The USSC's achievements and acts of goodwill more than outweighed its faults. The Sanitary Commission most certainly spared many Union soldiers much suffering.

Rivaling the USSC and sometimes competing with it was the Western Sanitary Commission. The WSC played a central role in assisting troops and refugees in the Mississippi Valley and the Western theater of the Civil War. Before the war's end, the WSC received and spent more than $770,000 which it raised nationwide. The WSC also donated and distributed supplies worth in excess of $3,500,000. It would also render services that far surpassed its original intentions and received high praise from commanders, generals, army medical directors, and thousands of soldiers and refugees who benefited from its services.[11]

The scenario in the West was the same as in the east. The army Medical Bureau had made few preparations to handle the large number of casualties resulting from major battles. Early in the war, those wounded in battles were cared for in local makeshift hospitals. The nearest decent hospital facilities were located in St. Louis, New Orleans, and a few other major cities. Wounded troops were sometimes transported over 100 miles in army wagons and ambulances to the nearest railheads. From these railheads, they would be transported in railcars to the nearest city that possessed adequate hospital facilities. Once the war began, these hospitals quickly became crowded and overexerted.

Stepping up to organize relief efforts in the Mississippi Valley region was the Reverend William Greenleaf Eliot, pastor of the Unitarian Church of the Messiah in St. Louis. In some sense, Eliot was the professional rival of Henry Bellows as Eliot was equally fond of power. Some people, including Bellows, may have been misled by his frail physique and nervous manner. But Eliot was forceful, often ill mannered and had many compunctions about the seemingly neglected sanitary conditions of the western theater.[12] Anticipating the inevitable difficulties of the war, Eliot organized the St. Louis Provident Society to coordinate various charities in St. Louis. In August of 1861, Eliot began to investigate the military hospital situation. Eliot, like so many others, was not pleased with what he found. Eliot subsequently approached Jessie Benton Fremont, wife of the departmental commander, with a plan to help solve this problem. Before Fremont was contacted by Eliot, she had already asked Dorothea Dix, army superintendent of women nurses, to make an inspection tour of the area. When Dix arrived, Eliot showed his plan to her, winning her support. General John Charles Fremont then quickly issued a general order, which used Eliot's wording verbatim, thereby establishing a headquarters for the Western Sanitary Commission in St. Louis.[13]

Within its first two months, the WSC adequately supplied many Mississippi River Valley locations with hospital buildings, nurses, food, clean water and other important aids. The Western Sanitary Commission was seemingly on a very successful path. But all did not go well for the WSC. Its better-known counterpart in the east, the United States Sanitary Commission, soon threatened the WSC's independent existence. Western sectionalism was already an established fact and it may have been no less mischievous than Southern sectionalism. USSC centers in Chicago and Philadelphia were concerned because the Commission had thus far held no session at the west.[14]

Henry Bellows of the USSC believed that for the sake of efficiency, all Union sanitary work should be coordinated through his agency. The USSC was shocked when Fremont bypassed one of its representatives in St. Louis to establish the Western Sanitary Commission. USSC Commissioner George Templeton Strong blamed Dorothea Dix, asserting that she was repaying the USSC for failing to acknowledge and give full attention to all her suggestions. Strong complained:

> General Fremont seems to have set up a local Sanitary Commission of his own in St. Louis, to act under the direction of Miss Dix...She is disgusted with us, because we do not leave everything else and rush off the instant she tells us of something that needs attention.[15]

Strong certainly saw Dorothea Dix as a bit of a nuisance in the USSC. He often told of one instance when the USSC was in Washington. Dix approached Strong and other USSC officials in breathless excitement to say that a cow in the Smithsonian was dying of sunstroke, and took it very ill that they did not adjourn instantly to look after the case.[16]

The USSC and WSC finally came to a compromise in October when Eliot met with members of the USSC in Washington. Their resolution provided that the WSC would cooperate with the USSC in every way practical, while assuring its eastern counterpart that it would limit its operations to the Trans-Mississippi theater.[17] This episode between the USSC and the WSC proved that even the most well-meaning of organizations were not immune to such faults as jealousies and competitions. As noble and heroic as the idea of a unified voluntary movement seems, the whole phenomenon was, at times, less than unified. But collisions between large agencies such as the Medical Bureau, USSC, and WSC were inevitable. Eliot would often observe that the most hateful of all jealousies and controversies were those among philanthropic or charitable associations.[18] Pure harmonious cooperation between large agencies would be of absurdly high expectations. Considering the relative effectiveness of voluntarism, however, the ordeal between the Western and Eastern agencies did not seem to cripple the movement very much.

Offering more than material relief to the troops was the United States Christian Commission. The Christian Commission was organized later in 1861 by YMCA officials who more or less followed the example of the USSC. The Christian Commission offered more of a spiritual relief to soldiers. The Christian Commission explained to Jefferson Davis, president of the Confederacy, that

> It is a voluntary agency-Christian, not political, evangelical, not denominational-and sends earnest Christian men as delegates to minister in person to the spiritual and physical relief and benefit of the army and navy and furnishes good reading matter for distribution by its delegates.[19]

Although the Sanitary and Christian Commissions played the most important role in directing voluntary aid, numerous unaffiliated groups collected money and distributed goods by their own representatives.[20] The refreshment saloons of Philadelphia are the best example of this decentralized voluntarism. Refreshment saloons were established for transient soldiers passing through the Philadelphia community. At these places, men could rest, eat a good meal, drink, and receive proper medical care, all services having been donated by citizens in the area.[21]

[20] Hamlett Robert Bremner, *The Public Good: Philanthropy and Welfare in the Civil War Era* (New York, Random House, 1980), 65-9.

The Cooper Shop Refreshment Saloon began in May 1861 when the women of Southwark observed the trainloads of troops who gathered in Philadelphia to await transportation south. The women responded by immediately forming a committee which began to distribute coffee and refreshments to these hungry troops. The efforts of these women soon attracted the attention of others who began a drive in the city to collect provisions. The examples set by these people were soon emulated as the citizenry of Philadelphia turned out in throngs with donations. Butchers, milk men, and storekeepers all generously responded with offerings from their respective guilds. The Cooper Shop Refreshment Saloon grew quickly and could soon feed 1,000 soldiers in only one hour.[22]

The refreshment saloons of Philadelphia were not mere rudimentary, makeshift distributing centers of barely edible food. They were, in fact, high quality preparers of good, nutritious meals. Compared to the standards of half rations and undercooked food that soldiers had become accustomed to, the meals prepared by the refreshment saloons were an elegant feast. Private Wilbur Fisk described his stop at the Cooper Shop Refreshment Saloon in Philadelphia:

> At the Cooper Shop Volunteer Refreshment Saloon we found a glorious supper prepared expressly for us. Bread of an excellent quality, butter and cheese, pickles, hot coffee, and all that a hungry soldier need ask. It was not soldiers' living at all, it was good enough for a first class hotel. This is the first place of the kind that has been opened since the war broke out, and I doubt if anymore modern, can surpass it.[23]

Soldiers like Fisk often remarked that Americans should take pride in these kinds of philanthropic accomplishments. Considering the fact that the Union was embedded in a long and relentless war, such accomplishments were truly remarkable.

Still more local, decentralized groups formed to assist other victims of the war. In many of the North's cities and towns, private groups and city officials worked alongside of each other to secure funds to dispense to the families of volunteers themselves. Quakers, who were particularly upset by any action that may improve the war effort, sometimes became notorious for knitting soldiers' gloves without trigger fingers.[24] But they soon found avenues through which they could offer assistance without compromising their pacifist principles. A great number of Quakers participated in fund raisers to assist the droves of contraband, or runaway slaves, that fled North. Northern free blacks were also active in voluntary activities by assisting contrabands, sending aid to enclaves of Southern freed people, and preparing basic necessity packages for local black regiments. Spontaneous organizations for collecting special donations were also formed. In one of the most peculiar instances of benevolence, Philadelphians raised money to donate to Manchester, England's impoverished factory workers when they learned that the Civil War had crippled the British textile industry. Such localized efforts cannot be discounted as they were perfect supplements to the larger national organizations.

Not the least of the effects that voluntarism had was its impact on medical history. The voluntary movement that occurred during the Civil War could be considered the forerunner of the American Red Cross. One of the era's most influential volunteers was Clara Barton. Encouragement from other volunteers and the things she saw during the Civil War precipitated her obsession with forming the American Red Cross. After dealing with an initially unenthusiastic Washington, the Red Cross in America was functioning. The history of the American Red Cross need not be repeated here. It suffices to say that the innovations and benefits of the Red Cross of America in handling disasters, particularly the cataclysms of epidemics, cyclones, hurricanes, and overseas famines, are incalculable. It makes one wonder what other kinds of pioneering organizations could have been formed in the United States had voluntarism produced more Clara Bartons.

The voluntary movement also produced enormous strides of progress in the area of American hospitals. At the beginning of the war, medical facilities were entirely insufficient. The Union's emergency medical system was comprised of only a handful of career surgeons, a few men from the ranks serving as orderlies and nurses, no ambulance service, and, of course, no proper hospitals to treat the droves of sick and wounded troops. The efforts of the North's volunteers, however, precipitated change. The Sanitary Commission pressured the government into building higher quality, pavilion-type hospitals based on those developed during the Crimean War. Subsequent construction of more hospitals saw an increasing quality in the buildings and their facilities. These hospitals were so well equipped and of such good quality that future hospitals of World War One were based on their designs. The Civil War experience and the examples put forth by voluntary agencies such as the Sanitary Commission helped crystallize a consensus about the specific elements that constituted a good hospital.[25] In doing so, voluntarism of the Civil War period helped motivate those who sought to make the new, big, efficient, well-equipped hospital a reality. If these hospitals could be made to work effectively under the harsh demands of war, they could surely be made even more efficacious in peacetime. Because of Civil War voluntarism, the last three decades of the nineteenth century have the distinction of clearly marking the beginning of an era which brought more changes to medicine and medical practice than any other time in history.

[25] Charles E. Rosenburg, *The Care of Strangers: Rise of America's Hospital System* (New York: Basic Books, 1987), 98.

Moreover, voluntarism was a critical factor in the North's victory. Judge J.A.P. Campbell was correct in his assessment of the South when he said, "Sacrifices and prayers and efforts were, all combined, insufficient to bring final victory to our standard."[36] Insufficiency would certainly describe the organized relief and medical work of the South. Although local soldiers' aid and hospital societies developed in the South, the Confederacy never possessed a counterpart to the Sanitary or Christian Commissions. The Confederacy's thin line of societies doubtless provided many valuable services, but Confederate troops, as a whole, did not fare as well in medical care as did their Union enemies. The percentage of Confederate troops who perished from disease was double that of Union troops. The medical corps of the Confederacy were never able to provide sick and wounded soldiers with the proper amount of food and supplies. Had the North failed to produce voluntary organizations such as the Sanitary Commission, the odds against the Confederacy may have been a little more even.

Finally, the common experiences of Northern volunteers underlined the Civil War's role as a nationalizing, centralizing force. Nearly every facet of the war effort depended on the successful integration of diverse voluntary efforts. Through an intricate web of established associational ties, patriotism was appealed to, making this integration successful. This institutional complexity had the effect of giving volunteers the freedom to do as little or as much as they chose.[37] There were men and women who volunteered to go strait into the battlefield as agents for national or local groups. Some volunteers kept their anonymity while others, such as Clara Baron, became national heroes. The heroic sacrifices of the North's women were even documented in several books, such as Clara Barton's *Angels of the Battlefield*, that were published after the war. The array of organizations that were formed served to open the doors for future organized philanthropic activities. The leaders of the voluntary movement and the volunteers themselves formed a dynasty of benevolence in America in which everyone could take civic pride. Private Wilbur Fisk once remarked that "Americans may well be proud of their nation when the common people show a spirit like this, through a long relentless war."[38]

Media and the construction of identity: Young women's use of "Friends"

Kristi L. Eaves
Communication Department
Peace College
15 E. Peace Street
Raleigh NC 27604

Faculty Advisor

David B. McLennan

Research focusing on the psychological implications of media uses and gratifications has focused on how general and specific audiences consume popular culture. One potential use for this research is to explore how specific audiences use mass mediated messages for identity formation.

This study focuses on how female college students consume the popular NBC television show "Friends." Students (N=80) were given a questionnaire based on Radway's (1984) reader response questionnaire and the uses and gratifications instrument. In addition, ten additional students participated in a focus group interview on the subject of how and why they watch the show.

These findings suggest that college women are sophisticated viewers that have multiple uses for "Friends" including testing the conversational competence of their significant others.

INTRODUCTION

Mass communication theorists have long argued that media affects the formation of individual identities. Real (1989) states that "personal experience combines with media experience as we construct individual lives under the directing influence of powerful institutions" (15). At the minimum, television viewers have felt a strong bond with characters on shows and the actors that portrayed such characters. Taken to the extreme, some viewers have over-identified with television characters and failed to see the division between fiction and reality.

How television affects individual identity continues to be a question for researchers. Real (1989) suggests that viewers often use television characters as role models, claiming that viewers "find elements of our validity and connectedness in the media" (26). Other research (Novak, 1977; Kidd, 1975; Lull, 1980) also supports this claim that media portraits often provide a comparison base for individuals assessing their self-image, often resulting in what Cathcart and Gumpert (1986) refer to as the "significant other."

More broadly, television affects the public character. Real (1989) argues that television creates a set of symbols that represent the national experience. If this is true, then television in the last half of the last decade of the twentieth century symbolizes a culture far removed from the experience of average Americans. Politicians such as former Vice President Dan Quayle attack television shows for promoting liberal causes.

The popular NBC sitcom "Friends" exemplifies the claim that many conservative critics of television make about prime time viewing. The show, a favorite among men and women of college age, revolves around the lives of six young adults and their various sexual exploits. Columnist George Will (1996) even suggests that the show's humor is too graphic for the 8 p. m. time slot and could even result in a conservative backlash in politics: "When parents cannot watch early evening television with their children without wincing, their distress will take on political coloration, and the winner of the nation's premier political office is apt to be he who best exemplifies credible disgust with what distresses them" (A16).

Although researchers disagree on the nature of the affect the media has on shaping identity, it is clear that identity can be affected on many different levels. An individual's identity can be shaped by his or her interaction with a character on a particular show, while the identity of a group, such as a generation of college students, can be shaped by the whole theme of a show like M*A*S*H. Also, identity can be shaped on a national level by programming symbolizing the general attitudes of that time.

REVIEW OF LITERATURE

Viewing Behavior

In trying to understand how and why people watch television generally and any program specifically, two distinct theoretical positions are represented by the research. The first position is that people's motives for watching television programs and uses for the particular programs are unique. Given new developments in media technology, it could be argued that viewing choices are so great in number that group viewing patterns are impossible to discern. Brunette and Wills (1989) take the extreme position that there is no normal viewing experience. They suggest that the media text must be considered in light of postmodern's radicalized notion of context. Television viewing then, becomes a purely individualized experience that cannot be shared by anyone else.

This position cuts against the standard social science belief in patterned viewing experiences. The "Uses and Gratifications" theoretical model posits that individuals have a limited number of needs that are fulfilled by consuming mediated messages, including television programs. Rosengren and Windahl (1986) discuss four "functional alternatives" or "uses" for television viewing: change, compensation, escape, and vicarious experience. Viewers hoping to transform an attitude or behavior might identify with particular characters or themes of a television program. Using a television show for escape purposes would mean the viewer watches to postpone dealing with a day-to-day problems or simply to relax after a tough day. Compensation occurs when the viewer uses a television show to make up for something, such as romantic relationship, missing from their lives. Vicarious experience carries this compensation one step further, allowing the viewer to actually live their lives through those of the characters. For example, Cathcart (1986) cites cases where viewers watch soaps to experience things, such as wild love affairs, that they will never experience in real life. These uses depend on a number of factors, including degree of involvement with a particular mediated message and amount of media consumption. To put this in lay terms, how someone uses a mediated message depends on how much the person identifies with the message and how often he or she is exposed to the message.

Common sense and empirical observation suggests that group viewing patterns emerge. This is particularly true with young audiences. In the last twenty years college men and women have routinely gathered in groups to watch popular television programs such as "M*A*S*H," "Newhart," "Cheers" and daytime soap operas. The significance of this fact is not only that many individuals prefer watching the same programs with groups of people, but that these programs functioned as a means of fulfilling group maintenance and identity needs for individuals. The idea that media rituals can perform even therapeutically for individuals has been explored by researchers such as Payne (1989).

Uses of Television

For years, theorists have argued that television provides connections for people lost in a contemporary society that is fragmented and without strong traditional institutions such as family and church. Television is particularly powerful because it shows life that is often in sharp contrast to the reality of everyday life. Social commentator Philip Slater (1976) argues that television shows featuring characters enjoying life poses an impossible standard for real people who feel further distanced from their dreams. This contrast is further explored by psychologists such as Rollo May (1991) who contend that, for many, television viewing is an attempt to revive a depressed life.

Scholars such as Hart (1994) contend that television fills an emotional void in modern life by delivering intimacy at all hours of the day, while others such as Merelman (1984) argue that the intimate disclosure we are used to seeing on television has become the norm for everyday living. This view that television shapes social interaction is extended by several scholars who suggest that television replaces social interaction or makes social interaction less desirable than consuming television images. Cathcart and Gumpert (1986) argue that para-social interactions are less threatening than real interactions and that the communication patterns engaged in by television characters create an ideal that real communication interactions cannot match. Thus, television viewing functions as a substitute for interpersonal interaction. Cathcart and Gumpert argue that these para-social interactions both comfort and distress the viewer. These relationships are comforting because they are "always predictable, never unpleasant, always sympathetic, never threatening." On the other hand, these para-social relationships are stressors because they allow for unreal expectations to inhibit actual interpersonal interactions. Building on this idea, Miller (1986) states that viewing media messages enables people to predict the success or failure of interpersonal messages. Thus, some viewers construct "scripts" for their interpersonal relationships based on fictional accounts on television and in film.

Media and Identity Formation

The belief that mediated messages affect individual identity formation and maintenance is pervasive. Media theorist Michael Real (1986) argues succinctly that media "penetrate daily life, creating an environment where identities are formed" (15). Within this viewpoint, there are theorists who suggest that television performs a valuable social function in helping viewers learn about the world around them. Cathcart (1986) argues that television shows, like soap operas, expand interpersonal relationships by coaching viewers about appropriate responses to be used in interpersonal relationships. Caughey (1986) mildly supports this position by stating that some television characters can be used as a mentor or guide, but strongly warns that viewers "may compensate with artificial companions" (p. 233).

Carbaugh (1996) argues that identity is a more complex issue. He suggests that a television viewer may learn two sets of appropriate behaviors from consuming media messages. First, a viewer may appropriate a set of behaviors for his or her personal identity. Second, a viewer may learn ways of acting in public, thus creating a social identity. This distinction between the two possible identities is particularly important for viewers that consume media messages in group settings.

METHOD

Two groups of college students participated in the study. The first group (N=80) responded to a questionnaire on viewing behaviors and attitudes. The second (N=10) participated in a focus group interview on the subject of watching "Friends." Participants in both groups were predominantly white, 18-22 year old female college students at a small all-women's college. The average age was 19. Participation in the study was voluntary and only those students that had seen the show were selected for participation in the questionnaire and focus group segments of the study.

The questionnaire employed in the study combined questions regarding the participants television viewing history and types of shows they prefer to watch with specific questions about the television show "Friends." The questionnaire was constructed using Radway's (1984) survey given to readers of romance novels and standard questions used by researchers employing the "uses and gratifications" theoretical position. This theoretical and methodological position was used because of its audience-centered approach that helps understand why people use media to explain viewers' motives for media exposure and perceived personal outcomes for that exposure (Perse, 1996). The questionnaire was distributed to all students at the college (N=435) with the instructions to respond only if familiar with "Friends." Eighty students responded.

From the eighty students that responded to the initial questionnaire, ten students were randomly selected to participate in a focus group interview. These participants were asked to watch an episode of "Friends." During the viewing, participants were allowed to interact with one another and comment freely on what they viewed. After viewing the episode, a series of questions was asked of the group about this episode specifically and the program generally. The schedule of questions was prepared ahead of the interview and the participant responses were taped, transcribed, and analyzed by the researcher.

This approach of combining survey and ethnographic research fulfills Radway's (1984) observation that a complex methodological approach is necessary for understanding the complexity of mass culture's impact on social life. By asking participants to recall how they view a popular show like "Friends" and also observing them watching and talking about the show, we can gain an understanding of how popular culture influences personal and social identity formation.

RESULTS

To the non-fan, "Friends" appears to be typical escapist entertainment television without much relevance or potential impact on an audience member's life. To the fan, however, "Friends" is a more complex message with important effects on the lives and identities of college age women in the 1990s. Watching "Friends" is a media ritual for many college age women, one that performs important group and individual identity functions.

The idea that a television show performs group functions is not a new one. In fact, each generation of college students has one television program that it adopts as its own. "The Bob Newhart Show," "M*A*S*H," "Cheers," and "The Simpsons" are examples of television shows that were extremely popular with college students. The popularity of these shows extends beyond the quality of the scripts or acting and exists because of the topics covered in the programs and the interpersonal relationships portrayed in each program. "M*A*S*H," for example was popular with college audiences in the late 1970s and early 1980s because it portrayed people rebelling against authority, a theme common in programs popular with college audiences. "Cheers" remained a college student favorite for years because of its unique characters, but also because it focused on the changing nature of interpersonal relationships and the tribulations faced by the characters engaged in the relationships. Not only are these shows important to their respective college audiences, but they were shows that college students watched grouped together around dormitory or apartment television sets. Watching these programs and participating in the watching of these programs with small or large groups of friends were weekly rituals, a classroom for learning about popular culture and a time to enact the important socialization rituals associated with being a college student. Few college students of the "Cheers" generation, for example, could resist shouting "Norm" along with the Cheers' regulars as George Wendt's character entered the bar during each episode.

"Friends," a sitcom about the lives and relationships of six people in their mid-twenties, functions in a similar manner for a segment of college students in the mid-1990s as M*A*S*H and "Cheers" did for previous generations. In the population studied, 43.8 percent of those surveyed listed "Friends" as their favorite television show, with over 80 percent ranking "Friends" among their top three favorite shows to watch. "ER," a medical drama, came in a distant second as the participant's favorite show, capturing only 10 percent of the audience's preference. Over half of the participants also answered that they began watching the show after a friend recommended it to them, offering one explanation of how the show became so popular with the 18-24 age group.

More important than why they began watching "Friends," is how participants currently watch the show. Over 57 percent of those surveyed watch the show with large groups of people, with a total of 85 percent watching with at least one other person. A large number, 77.5 percent, reported that they watch the show with a group of close friends. There are many reasons why "Friends" is so popular among groups of college students, including: the show's Thursday night slot, the age range and lifestyle portrayed, the focus on relationships and interpersonal communication, and identification with the characters. With Thursday night being one of the most popular nights to go out, the "Friends" time slot is a typical time for college students to get together. Focus group participants confirmed this idea when they reported gathering together specifically for the purpose of watching "Friends" on Thursday nights as a prelude to other social events. Thus, in this case "Friends" serves as a catalyst for other interpersonal activities.

From the discussion, the viewers painted a vivid picture of the typical viewing experience: Several viewers pile into one room with a large television set, perhaps with a large pizza on the way, and sing in unison the theme song, "I'll be There for You," as they wait for the show to begin. All is quiet during the show except for spontaneous outbursts of laughter. During the commercials, chatter about things such as what Monica is wearing, the way Ross looked at Rachel, and various lines of dialogue. While observing the participants view the taped episode, it was quite clear that viewers had their particular favorite character, whose lines were directly repeated or commented upon. This reveals that the act of watching "Friends" is an active process that is just as important as the show itself. The rituals that take place before, during, and after the program are an integral part of the show's popularity and influence.

One obvious purpose for the show is to provide entertainment for those watching the show. Both during an episode and immediately following each episode of "Friends," subjects reported using dialogue from the show for entertainment purposes. Many reported quoting funny lines from the evening's program to other friends who had also watched the program. Another stated specifically that she watched "Friends" because of its entertainment value. She explains, 'It gives you some down time in your day to relieve stress. Laughter is a way of relieving stress." Using "Friends" for entertainment purposes, one of Rosengren and Windhal's 'uses and gratifications,' the viewers retreat from the pressures of everyday life by laughing at the trials of show's fictional characters.

Beyond functioning for group maintenance and entertainment purposes, "Friends" also functions on an individual level. For example, many college women reported using the show as a basis for social comparison. Both the survey participants and the focus group interviewees revealed that viewers compare the interpersonal relationships on the show, romantic and platonic, to their own relationships. Of those participating in the survey, 45 percent rated discussions about relationships as the most fundamental element of "Friends." One viewer describes why these relationships are so important to the show when she compares "Friends" to other shows featuring groups of twenty somethings living together: It ["Friends"] has appeal to people especially in our age category, because there aren't many shows. . .that relate to people our age about issues like dating, friendships, roommates and those things. . . It is something you can relate to; you don't have to feel alone." The survey revealed that most viewers agreed that the relationships on the show are at least somewhat realistic and over 60 percent of the viewers agreed that the characters of "Friends" are somewhat similar to people they know in real life.

During the focus group, discussions about specific episodes allowed the participants to describe exactly how the comparison between the relationships on the show and their own take place as well as describe the feelings that result from this comparison. In a discussion about an episode where two of the main characters, Ross and Rachel, kiss at the end of the show, one viewer told how this reminded her of her own relationship with her boyfriend: "I guess when I watch something like that it makes me think of my own personal life. I think of times my boyfriend and I fell in love. It just gives me that feeling that you had in your life that maybe you don't have anymore." In this case, the viewer allows Ross's romantic actions to compensate for the lack of romance in her own relationship. Several participants reported using the characters and their dialogue as ways of negatively evaluating their own relationships. One participant wished that "her boyfriend could talk about his feelings like Ross," while another lamented that her signficant other "was not nearly as witty as Chandler." Although all participants recognized the fictional nature of the show, their discussion confirmed Miller's (1986) claim that viewers predict behavior from what they see or hear.

Another facet of the way "Friends" affects the identity of individual viewers are the characteristics or traits that viewers admire in the characters on the show. The questionnaire and the focus group illustrated an interesting parallel. The survey revealed that college-aged women most admired the female characters' sense of humor, their intelligence and their independence. In the male characters, the viewers liked to see a sense of humor, intelligence and a good body. This supports DeFluer and Dennis's (1996) idea that viewers model the behavior of characters they watch on television. DeFleur and Dennis argue that the viewers are identify with the characters, believe that she is like them or wishes that she was like them, and then reproduces one of the characters actions in an interpersonal setting. Strong support for this notion was found in the survey results, as 91 percent of those participating felt that the female characters reactions and feelings were at least somewhat similar to their own.

DISCUSSION

Television critics who dismiss "Friends" as unrealistic or as an assault on family values have valid arguments if one examines the NBC sitcom's role as a barometer of our culture at large. "Friends" is not a landmark television program, along the lines of "All in the Family" or "M*A*S*H." However, those who dismiss "Friends" as a metaphor for its generation and discuss how it legitimizes its fans' lack of direction miss the importance of the show completely. "Friends" does more than reflect the most recent hairstyle or clothing trend—it reflects, even shapes the way college students form and maintain interpersonal relationships.

Studying how viewers consume television shows such as "Friends" provides insight into the complex way television shapes identity, both private and social. Television viewing, particularly

BEST COPY AVAILABLE

with college-aged audiences, is both a public and private affair. These viewers create a set of behaviors for each type of viewing, possibly creating two sets of identities. As Carbaugh argues (1996), social identities are created to identify with a larger group.

This study, through its use of survey and ethnographic research, demonstrates the complex ways in which people consume media messages. A complex mehodology using a combination of survey and ethnographic techniques should be employed to give a richer understanding of why people consume and use the messages they do. Future research should continue examining the relationship between particular audiences and the popular culture messages they consume.

Dress and Nonverbal Communication

Barbara Heinemann
Design, Housing, and Apparel

Faculty Advisor
Joanne B Eicher, Ph D

Humans everywhere dress their bodies with garments, ornamentation, or body modification While dress may not always be essential for survival, it is a cultural necessity for individuals to announce status, rank, power, identity This practice lets us inform others who we are, and in turn make assessments about others In recent years, social scientists have begun to study both the meaning and relevance of dress in a systematic and scientific way This study investigates thirty students' accounts of their experiences connecting the meaning and relevance of dress as they relate to the nonverbal communication concepts proposed by Gregory P Stone, and compares those accounts which support his hypothesis and those which seem to refute it

BACKGROUND

Gregory P Stone was both a social scientist and pioneer in the study of dress He was interested in dress as an aid in establishing an individual's identity, and as part of a nonverbal communication system In his 1963 article, "Appearance and the Self," Stone proposed that each individual presents a "program" of dress to others, which is assessed or "reviewed" by them If what the individual intended to portray in his or her dress matches the review, Stone claimed that the self was "validated;" if the intention was not matched by the review, the self was "challenged " Stone also implied in the latter case, that individuals would change their programs in order to become validated and, therefore, socially accepted

This research project uses the framework from Stone's 1963 article, and is supported by data collected by Joanne B Eicher in 1995 Eicher teaches theory based on Stone's research and commented that his theory has been widely discussed but not extensively tested through research She realized that a question on a midterm exam asking students to write an essay illustrating Stone's theory from a life experience could be used to test these concepts All thirty students signed consent forms giving permission to use their answers in this study

Because dress is a powerful means of communication and makes many statements about an individual, I have included definitions of both dress and communication before discussing how dress "contributes to the acquisition of identities and the development of a sense of self" (Eicher and Roach-Higgins, 1993 13) Questions to consider include How does dress help construct identity? What happens when role expectations are not matched by clothing choices? Who influences dress—family members, peer groups, social or cultural institutions?

Eicher and Roach-Higgins provide a comprehensive definition of dress that "identifies both direct body changes and items added to the body" (1993 15) Dressing the body occurs when human beings modify or supplement their bodies not only with articles of clothing, accessories, jewelry, but also with changes in hair, skin, nails, muscular or skeletal system, teeth, breath While "the visual stimuli of dress" (1993 17) may be the most obvious, odor, taste, sound, and touch are other sensory stimuli that help in establishing an individual's identity

Current definitions of communication agree that ideas must be shared in some way before communication can exist, and "should be thought of as a process, not simply as a transfer of meaning from one mind to another" (Ross, 1986 8) This involves both common experience and mutual influence "Whether we know it or not, we communicate hoping to influence others to respond as we want them to" (1986 8)

Communication requires a series of events, and two or more participants First, the sender conveys a message by sorting through a vast store of data to select and refine the specific intent of the message It is then encoded and translated into signs and symbols that we commonly think of as language How the message is coded, the method for its transmittal, and the skill with which it is transmitted influence the meaning it will have for the receiver The receiver decodes the signal by sorting, selecting, and extracting meanings until the sender's message has been reproduced in the receiver's mind. If the receiver's version is similar to the sender's ideas, communication is achieved, if it is dissimilar, not much communication will occur. The meaning of the message also depends on the knowledge and experience of the receiver. Ross says, "The value of knowing your listener and the value of audience analysis now become evident" (1986 9)

Language helps us communicate about who we are and what we want others to know about us. Ross suggests that only about 35% of communication is verbal, others may claim even less. Tone of voice, gestures, facial expression, and body movement convey meaning as well. Dress makes statements about one's occupation, age, gender, social class, special affiliations, religion, geographic region. Both language and dress are dependent upon "each person's subjective interpretations" (Roach-Higgins and Eicher, 1995 11) of meaning, knowledge, experience, feelings, and previous training "within a particular cultural context" (1995 11)

In discussing self presentation through appearance, Efrat Tseelon says, "perhaps it is not really the type of audience that influences the way one feels about one's self and appearance, but the kind of atmosphere induced by that audience whether supportive or disapproving, whether creating a feeling of visibility or invisibility ..." (1992 507). The translation a person uses "when applying learned meanings of dress within specific social situations" (Roach-Higgins and Eicher, 1995 11) is also important.

Roach-Higgins, Eicher, and Johnson discuss two functions of dress first, dress can alter body processes, and second, dress can be a medium for communication. "Designating a type of dress as protective clothing illustrates that some examples of dress communicate that they are likely to have positive effects on body processes" (1995 11). An astronaut's space suit as protective clothing and a portable environment is such an example. If identifying a type of dress by aesthetic qualities, it "belongs with the discussion of social function of dress as a means of communicating individual and social standards" (1995 11). Geisha dress, for example, communicates cultural and social standards through aesthetic properties. Both garments are encoded in signs and symbols that are transmitted visually. As in language, the viewer/receiver attempts to decode the meaning, and will be more or less successful depending on the range of that individual's experience and knowledge.

RESEARCH DATA—STUDENT'S RESPONSES

Methodology. The data for this paper came from a midterm examination in a class of 30 students, comprised of 27 undergraduates and three master's level graduate students. The examination was not designed with a research goal in mind, it was after the exams were graded and recorded that the instructor realized students' answers could provide a test of Stone's concepts. Students had been asked to write an essay responding to the following

> "The self according to Stone's theory of program and review may be validated or challenged. Illustrate program, review, validation, and challenge from your own life experience in regard to dress."

The students openly shared successes, challenges, triumphs, and defeats. Their answers were very creative, encompassing clothing examples ranging from occupational situations to social occasions to aesthetic expression to solemn and ceremonial events. While no demographic data were collected, the class is intended for juniors, seniors, and graduate students. Enrollment included traditional students and some mature, returning students. Most students had a major in clothing design or retail merchandising, although other disciplines were represented.

Findings. While almost a third of the students mentioned more that one example of program, review, validation, and challenge, this study examines only information from the first-mentioned example. Another third described one program with more than one review. Those examples were included in the study. Twenty-eight students described programs of themselves, two described programs of others. Table 1 shows the distribution of responses.

Table 1 Responses From the Sample of Thirty Students

Program, Review, Validation, Challenge	*No*	*%*	*Total*
Describes one program/one review	20	66 7	
Describes one program/multiple reviews	10	33 3	100
Mentions validation (program and review coinciding)	22	73 3	
Does not mention validation	8	26 7	100
Mentions challenge (program and review conflicting)	19	63 3	
Does not mention challenge	11	36 7	100

Table 2 shows responses from the eleven students who mentioned program change.

Table 2 Responses About Program Change From Sample of Students

Mentions Program Change	*No*	*%*	*Total*
Reviewer changed response	1	9.1	
Individual changed program	10	90.9	100

All students described examples of validation or challenge, and most (27) described their feelings about being validated, challenged, or how they felt after changing programs. Table 3 shows the distribution of responses from the sample of those students who described their feelings in response to review. Since some students received more than one review for one program, the total number of responses is greater than the number of students responding about feelings.

Table 3 Feelings About Review From Sample of Students

Feelings: Validation, Challenge, Change	+	%	–	%	±	%	*Total*
Describes feelings about validation	19	100.0	0	0.0	0	0.0	19
Describes feelings about challenge	1	7.1	12	85.8	1	7.1	14
Describes feelings after program change	6	75.0	2	25.0	0	0.0	8

Key: (+) positive feelings; (–) negative feelings; (±) neutral feelings

In their responses, students elaborated on feelings about validation, challenge, and changes made because of challenges to their programs. The responses reflected a broad range of social and cultural contexts, and many fit in more than one category. Table 4 illustrates the context of the program and review examples.

Socialization for social role	1	3
Time and Place	*No*	*Total*
Fashion	1	1

The majority of students described experiences in which a program was either validated and the student felt affirmed, or challenged and the student felt socially unaccepted, both of which support Stone's hypothesis. Experiences involving one program with multiple reviews were more complex. All students depicting this situation described both validation and challenge. In his doctoral dissertation, Stone discussed how "interruptions of identity are facilitated by changes of dress" (1959:164). By the same token, if one can't present a change of dress, then the individual's identity (program) would be challenged, also supporting Stone's hypothesis.

One student described a day in which both validation and challenge occurred. She wore the same clothes for school, work, a meeting, and an evening event. Her plain black pants suit, black boots, no jewelry, basic makeup, and neatly brushed hair were validated at school. Since she sold jewelry at work she was expected to wear some; some customers challenged her program. After a meeting to secure sponsors for a project, she observed, "At least I knew it wasn't my legs they were giving the money to, it was my ideas." Later that night she met friends to see a punk band. "My program was really challenged. The people there thought I was... an older sister of a band member or a music critic or a producer of some sort." Different degrees of validation and challenge exist when presenting one program and participating in diverse activities.

Sometimes challenge was seen as a validation. A theater major found that hair helped portray or sabotage stage roles. When playing an 80-year-old, her makeup and hair were elaborate and complex. Not only did she receive good press reviews, her own sister didn't recognize her. Later, playing another older role, she was told to use glamour makeup accompanied by a contemporary costume and hairstyle. The reviews were brutal. "A major part of the criticism directed at me was related to my costume. My dress program, directed by others was severely and correctly challenged." Before this experience, she had described herself as "a restrained theatrical minimalist," believing "that costume in the theater, and everyday life had little meaning in identity. I was wrong...." The student had challenged her own review and was validated in the process.

In family issues, students were validated when family values coincided. When values conflicted, aesthetic expression or an aesthetic standard was always the arena for challenge. One student received an invitation to a cousin's Bar Mitzvah, specifying casual dress. Her mother said she could wear nice jeans and a blouse. The student added a blazer. "I walked in and immediately felt challenged....Everyone was dressed-up, including my mother who had told me I could wear jeans." This example is intriguing because the student did check the dress code with her mother so her clothing would be socially accepted. Stone considered the roles that socialization and appropriate dress play by comparing them to games, uniforms, and the apparent representation of the self. In the above instance, all but the student were wearing the appropriate "uniform."

In other examples students expressed less concern about family acceptance and more about peer acceptance. One student decided to get a tattoo as a way of expressing individuality. Although the student's friends (and even strangers) seemed to admire it, the student's mother had a very negative reaction. "She was embarrassed and wouldn't tell any of my relatives about it. She even sent me articles on laser surgery to remove tattoos. However, ... my mom has finally begun to validate and... accept it." In this instance, the reviewer (mother), not the student, changed her earlier review. Stone did not discuss this possibility.

In his article, "Becoming and Being Tattooed," Sanders suggested that individuals with tattoos validate each other. Tattoos may be "defined by others as a stigmatizing mark....Given the negative reaction that tattooees encounter with some frequency when casual associations or strangers become aware of their body decorations, most are selective about to whom they reveal their tattoos" (1988:418-9).

A variation on peer acceptance came from an identical twin who described herself as "sort of yuppie looking with trendy clothing, hair, cosmetics, and an athletic body." Her twin sister, however, had shaved her head, wore "grunge" clothing, a nose ring, and was overweight. "Our programs are very different and so are our reviews." The student was usually validated; her sister was frequently challenged. "She is always snickered at and stared at." Perhaps it didn't occur to the student that no one was forcing her twin to dress as she did. Like the tattooee, the "radical" twin and her friends may have reviewed "yuppies" as "narrow and convention-bound" (Sanders, 1988:419). The student also mentioned that she and her sister shared similar values, but she didn't mention if they were moral, religious, or other values. Social values, however, seemed to differ and were expressed through both social roles and cultural standards of aesthetic choice. It would be revealing to know how her sister and "radical" friends were reviewing the student. In this example, it appeared that one individual intentionally chose a message that would be reviewed negatively. Stone did not discuss this possibility either.

Weight was another aesthetic standard that two students explored. One student lost 40 pounds and felt good about her appearance,but she was unable to keep the weight off. She began feeling terrible about herself. Even when people complimented her, she said, "I felt like people were telling me this to be nice." Since the reviews did not coincide with her program, she felt challenged. In fact, the student challenged her reviewers, assuming they were insincere.

Clothing is a tangible and powerful sign of identity. Rubin, Scmilovitz, and Weiss noted that after losing weight, buying and wearing regular-sized clothing is "a mechanism for the removal of a stigma" (1993 10). Fat people "are subject to several unpleasant stigmas" (1993 3). They bear a medical stigma—obesity is a health hazard, a religious stigma—"'overindulgence' is a sin," an aesthetic stigma—"'fat' is considered ugly," and a moral stigma—they are "unable to control themselves" (1993 3).

The other student included stigma in describing her weight change. She specifically mentioned being seen as having no self-control. She also mentioned the challenge of meeting an aesthetic standard, and the role of clothing in defining her identity both before and after her weight loss. After losing 80 pounds, her style of dress changed dramatically. She described wearing clothes that were more feminine and body-contouring. She knew was being treated differently because she was meeting society's expectations. She said, "We do somewhat rely on others for our identity."

CONCLUSIONS

An individual assumes many roles and therefore, a number of identities. Data about those identities can be transmitted and processed visually. As Stone hypothesized, individuals form ideas about how other people will respond to their dress based on experience. If a person's predictions are correct, the nonverbal identity of the sender coincides with that of the receiver. If the sender's message differs from the receiver's meaning, interaction is difficult or perhaps impossible. This study examines only a small sample using one of Stone's concepts. Most examples support his hypothesis, however, he did not discuss the possibility of a reviewer changing a review, or that in some instances, a sender intentionally chooses a message that will be reviewed negatively. This project has sparked my interest in pursuing a more expansive and detailed investigation of these concepts.

In the last example, the student linked identity, gender, nonverbal communication, and clothing. Students were not identified by gender nor asked to specify gender in this study, and gender was not part of the original analysis. Even so, gender queries surfaced. What part does gender play in dress and nonverbal communication? How is gender defined? What constitutes gendered dress? Is it important to know another's gender?

Stone proposed that both language and vocabulary are gender specific, and every social transaction must be divided into two distinct and important components: appearance and discourse. Before meaningful communication can occur, appropriate language must be selected, therefore, participants need to identify each other. That requires knowing another's gender—usually a silent activity, established by appearance.

Confronting Learning Disabilities:

A Proactive Approach for Parents

Holly Kapp

Department of English and Modern Languages
Bowie State University
Bowie, Maryland 20715

Faculty Advisor:
Dr. George Sochan

An often used solution for problems in special education is prescribed medication. The option readily chosen by the apathetic parent is ritalin. This approach raises the question: what is fostering the cognitive development of the child, medication or parental involvement? The fact that one in seven school age children is eligible for special education requires that this question must be addressed. Contrary to many doctors' preference of ritalin as a panacea, a proactive approach for learning disabilities is parental involvement. Home schooling and other methods of active participation should be accepted as viable alternatives to medication. Recent cases of young students have shown significant improvement in learning through individual instruction. For example, one student diagnosed as learning disabled advanced by one school grade under his mother's active interest. For these reasons, and others yet to be explained, resolution for learning disabilities requires parental engagement.

INTRODUCTION

The term "special education" has a new meaning. There was a time when "special" referred to students with severe retardation or physical disabilities. Medical and educational professionals, however, are advancing their understanding of learning disabilities. Therefore, the term "special" now includes a much broader spectrum of children. Many types of disorders, such as "hyperactivity, autism, retardation, emotional disturbance as well as physical handicaps would be considered special need" (Ilg 180). What is unclear are the types of treatment that should be used for these children. An example of a commonly diagnosed learning disability is attention deficit disorder. Until recently, the most common method of treatment for this disorder was to prescribe medication, such as ritalin. This medication has been deemed a panacea for A.D.D. by many doctors, teachers and parents. However, there is not one solution to this problem and no two children will respond in the same way to the same treatment. So, what is the most effective way to treat a learning disability? This paper seeks to demonstrate that the sooner a problem is diagnosed, the better the chances for a quick resolution. And, treatment for learning disabilities should encompass many proactive strategies, such as parental involvement, tutoring, special education and counseling. The methodology used to evidence this theory is observation of children with learning disabilities coupled with research from books that address proactive approaches such as They Can But They Wont: Helping Students Overcome Work Inhibition and The Learning Mystique.

Unfortunately, learning disabilities occur more frequently than most people assume. According to Loraine Stern, author of "When a Child Has Trouble Learning", "More than 15% of school children are learning disabled, and they make up about half of the children who are eligible for special education" (86). That statistic translates to about one in seven school age children, which makes learning disabilities a primary concern for Americans today. However, some parents may not seek a diagnosis for their child due to the stigmatism often associated with learning disabilities which may hinder early detection.

"TINA" AND "BRAD"

In 10 year old Tina's case, when her parents realized that their daughter had problems paying attention in school, they immediately decided to consult a physician. The doctor diagnosed Tina as having A.D.D. and suggested that she take ritalin which is a medication used to "stimulate neurotransmitters in the brain, like dopamine, to help the brain work better" (Kennedy 51). Tina's parents took this advice, but they did not stop there. In addition to medication, Tina's parents enlisted the help of a tutor for assistance in the subjects where she proved to be weakest. Another aspect of Tina's treatment is parental involvement. Her parents pay close attention to their daughter's achievements and her minor setbacks. If there is the slightest concern over any problems reoccurring, these parents promptly find a remedy. They also incorporate a little "T.L.C." into their program. Tina knows that she is loved and this type of support is crucial for progress. Tina is improving her grades. In fact, her performance reached a satisfactory level within months because she responded so well to individual treatment. The course of action that Tina's parents are taking is working. But, would it work for other students or is there another way?

To answer these questions, the case of a six year old, named "Brad," can be analyzed. When this child attended kindergarten, his parents were receiving complaints about his inability to follow directions. He was also having problems with vowel and consonant sounds. At the end of the year, Brad's parents were informed that their son would probably be considered for special education. They, however, felt that part of the problem could be attributed to teacher failure. One observation Brad's mother made was that his teacher did not give positive reinforcement and, in fact, most of the feedback could be deemed quite negative. In a few instances, Brad made comments to his mother about how "dumb" he was, and said he did not want to go back to school. So, instead of enrolling him in special education, Brad's parents decided they would try personal attention for their son in the form of home schooling. This may sound quite drastic since home schooling is a considerably less conventional method than those used in the first case. However, this family made it a feasible alternative because Brad needed help. To ensure that their son's needs were being met, they enlisted the aid of their local school district's curriculum and coupled that with support from other home school families at their church. The program is working well. Brad's mother, who does the teaching, found that he responds extremely well to personal instruction. Brad now knows all of his vowel and consonant sounds. In fact, he is reading basic words. He is also following directions to the letter. In addition, Brad is learning about the world around him by taking weekly field trips with other home school families. Moreover, his mother incorporates religion into the lesson to ensure a strong moral foundation for her son. As in Tina's situation, there is an abundance of love. Brad is receiving much-needed support on a daily basis. Consequently, because of his mother's active interest Brad advanced one grade.

TYPES OF TREATMENT

The most common methods used when treating learning disabilities are medication, tutoring, special education and counseling; any combination of these can prove to be effective. Home schooling is also an alternative to be considered, especially for a student with A.D.D. who will have less distractions at home. However, as with treatment for any ailment, there are definite advantages and drawbacks to each type of treatment and when considering help for a child, these must be weighed.

For instance, when parents ask themselves the question, to medicate or not to medicate, the risks should not outweigh the advantages. Medication is a viable option for treating learning disabilities, and ritalin is one example of medication often recommended by doctors for the treatment of A.D.D. The fact that it can be obtained by attending a few doctor's visits is a plus for the argument of using this type of treatment.

There are, perhaps, much stronger arguments for the other side. First, some parents might think that they can stop searching for solutions because their child is being treated medically. However, "it is erroneous to believe that you can take a pill and have all your ills disappear"(Routburg 73). Also, a poor combination of medicines can be dangerous. Another factor to consider is the possibility that the medication might be forgotten occasionally which will affect the student's learning. Therefore, if medication is not an option, parents must explore other alternatives.

One seldom used option in treating learning problems is home schooling. Frequently, a child needs extra special attention that can not be obtained in public school. The formerly-noted case of Brad is a prime example. In this case, Brad's parents took the perspective that responsibilities which should lie in the hands of the school system were not being carried out. There seemed to be no positive reinforcement. This theory is corroborated in Gerald Coles' The Learning Mystique, wherein he quoted a study that found "teachers gave students little reinforcement of any kind, whether in the form of specific task related knowledge and praise or general support and encouragement" (92). If this is so, then the possibility of a student receiving no reinforcement may be ruled out by home schooling. However, parents must engage in a program that focuses on positive support and encourages their child. A problem with home schooling is that so many families today are double-income. What must be addressed is whether or not the parents are both working out of necessity or as a means to acquire material wealth. In Brad's case, his family is by no means comfortable. They are, in fact, barely making it. But, when it came time to make a choice, Brad's education came first.

Similarly, tutoring can be useful for those students who need extra attention to learn. In the case of a student who is capable of grasping a certain subject but needs a little extra time, tutoring could be the best option. The problem is that this special service may not always be available or practical. Many parents simply can not afford to pay someone to tutor their child. However, one way to acquire this service at no charge is by enlisting the help of other students at the child's school. According to Jerome H. Bruns, author of They Can But They Wont: Helping Students Overcome Work Inhibition, "students enjoy helping each other...in high school, members of the National Honors Society, Key Club, or other service organizations may be ready and willing to give tutorial assistance" (107). By recruiting a little extra help, parents may be giving their child the chance to contend with a tough system. However, there are still more options and added help can be attained in school.

Special education has been around in the public school system for many years now. It is, however, quite different than the "special" classrooms of the past. "Special education today is founded on the conviction that if certain principles are contentiously applied all children who have disabilities will be able to learn regardless of the nature or severity of their disability" (Shore 10). Because of the advancements in defining the word "special", this option is available to many students who would not have been considered for special education before. Since public education is free, the obstacle of practicality is removed. But, while this type of help can give that extra push that some students need, for some parents there are a few apprehensions. The first is the possibility of their child being stigmatized by the term "special". Another is the concern that their child may not be able to advance because his class is working at slower pace. Nevertheless, when contemplating this option the primary consideration should be what is best for the child. Counseling can also be a useful tool to assist a child with learning disabilities. Sometimes, emotional distress is a dominant factor in a child's inability to learn. Financial considerations, however, are one of the main barriers when pursuing this option. Many people will avoid enlisting a counselor because they do not think they can afford it. If this is the case, school psychologists are often available; "however, they are less flexible in terms of time than individuals in private practice" (Brusko 92). Another less widely known form of counseling is group support such as the Foundation for Children With Learning Disabilities and the Resource for Children With Special Needs Inc. (Levine 246). If the funds are available, private counseling is probably the best approach. When looking for a therapist, the parents have to do their homework. "If you and the therapist can not work harmoniously your child may lose as a consequence" (Routburg 81). The responsibility of finding a good therapist rests on the parents who must educate themselves about what is available. Nevertheless, a parent's obligation to his or her child is far greater than simply enlisting the help of others.

Parents owe their children personal support and love while going through what can be a exceedingly tumultuous experience for a child with learning problems. According to Marlene Brusko, author of Living With Your Teenager, "children need to be constantly reminded that they are loved" (57). Everyone requires a little tenderness, and for a child this need is even greater. If the student is making progress, he should be told. Positive reinforcement is crucial if the child is expected to achieve. Similarly, if the child is not doing well, the parent must encourage him to do better. Without parental support, a child stands little chance of progressing normally.

CONCLUSION

One way to determine which plan of attack to use when confronting learning disabilities would be to compare them with other ailments. For example, if a child were diagnosed with a disease that is potentially fatal, the parents would want to seek every option for him. The same should hold true when parents address their child's learning disability. Since no child will respond the same way as his or her equally "special" counterpart, different approaches must be taken with each individual. The most important realization a parent can make in regard to a child's learning disability is that there are no absolutes. The entire gamut of therapies, such as parental involvement, tutoring, special education and counseling, must be explored. In the cases that are cited here, Tina and Brad respond extremely well to a combination of proactive treatments: one to medication, tutoring and parental involvement, the other to home schooling and positive reinforcement from his parents. Also, the authors formerly quoted strengthen the argument for the use of proactive treatments. Regardless of what form of treatment is used, finding a remedy is crucial since children are our single most important natural resource.

Public Perceptions of Television Versus Newspaper Credibility: A Local Study

Andrea Lawson

Asheville, N.C. 28804-3299

Faculty Advisor:

Mark D. West

Research in the media has shown that public perceptions of credibility differ for newspapers and television. Previous studies have suggested that survey respondents tend to rate television as more credible than newspapers in their ability to provide news coverage, mainly because of television's ability to provide live, on-the-spot coverage of breaking events and because of the idea that "seeing is believing" in media content.

This project describes a public opinion study measuring perceptions of media credibility in Buncombe County, N.C. Respondents were questioned on their level of trust of both media in situations of local and national importance, as well as the medium they found most trustworthy overall. Results of the research could be used by local media as an indicator of public sentiment and as a tool for targeting possible audiences.

INTRODUCTION

Newspapers and television are the two media that provide the most information about current local and national news events. The two are in constant competition for the same audience. The public's perception of these two media has been the subject of countless research studies over the years. Though the two operate in different venues (print and electronic media), the information they provide is almost identical in content. This project explores Buncombe County, North Carolina residents' perceptions of, and willingness to trust, both of these media in specific situations. It provides an overview of previous research and a description of the research conducted. The main goal of this study is to determine which medium Buncombe County residents turn to for information about what's going on in the world today, from a local and national perspective.

MEASURING THE CREDIBILITY OF TELEVISION VERSUS NEWSPAPERS: PREVIOUS STUDIES

The idea of measuring credibility of television and newspapers is not a new one for media researchers. One of the most frequently cited studies measuring credibility of television versus newspapers was performed by Gaziano and McGrath (1986). The study sought to describe the measurement of credibility in previous research and report the results of a national survey which treated credibility as a multi-dimensional concept. The study asked respondents to rate the daily newspaper with which they were most familiar. Television newscasts were rated in a similar fashion. A 12-item scale was devised based on the responses and defined as "credibility." The results of the study found that 61 percent of respondents scored high on credibility for both media, but that respondents were more likely to believe television than to believe newspapers, mainly for the reason that "seeing is believing." Newspapers were rated as more trustworthy than television when respondents were asked which local media they trusted more when faced with a situation in their local area that was controversial or hard to understand. However, one half of respondents chose local TV news for local news in general. For national news, over half of respondents chose television news. Gaziano and McGrath found that the credibility of television news increases as the focus moves from local to state to national to international news. Overall, 64 percent of respondent chose television over newspapers when asked which medium they would pick if they could choose only one source for all their information.

In a study by Newhagen and Nass, the different criteria people use to evaluate newspaper and television news were examined. This study looked at the problem of defining a source as a person or an organization and found that television viewers base credibility of the medium on the personalities of on-camera newscasters, while newspaper readers base credibility judgments on the newspaper as an organizational unit rather than the set of individuals who create it. The study also showed that as the circulation size of a newspaper decreases, it is more likely to be seen as a collection of individuals than as an institution, and the personal dimension of credibility emerged.

A Gallup Poll report from 1995 found that 33 percent of respondents said they trust television news "quite a lot," while only 25 percent said they trust newspapers "quite a lot." A 1995 report by the Freedom Forum Media Studies Center at Columbia University found that television news' major strength lies in providing up-to-the-minute breaking news, while newspapers excel in providing information that is timely but more comprehensive. A similar study by the Times Mirror Center for People and the Press found that 74 percent of respondents "primarily" turn to television for local news, while only 20.9 percent pick up a newspaper.

HYPOTHESES

Based on previous research, the following hypotheses are presented:

H1: That Buncombe County residents will turn to television over newspapers for information about breaking news of local and national importance.

H2: That Buncombe County residents will choose television over newspapers as the medium from wich they get most of their information about what's going on in the world today.

H3: That residents will choose television over newspapers in situations of conflicting or different reports of the same story.

It is believed that the ease with which media consumers can access information through television news will be a driving factor in public perception. It is also believed that the increased amount of attention and involvement in the act of reading a newspaper will also affect public perceptions.

METHODS

Six questions were purchased from the Buncombe Poll in the fall of 1995. The questions are as follows:

1. Where do you get most of your news about what's going on in the world today--from newspapers or television?
2. How much do you trust newspaper coverage of an important local event, such as a city council election? Do you trust it completely, trust it somewhat, trust it a little, distrust it somewhat, or completely distrust it?
3. How much do you trust television coverage of the same event? Do you trust it completely, trust it somewhat, trust it a little, distrust it somewhat, or completely distrust it?
4. How much do you trust newspaper coverage of an important national event, such as the impeachment of a U.S. president? Do you trust it completely, trust it somewhat, trust it a little, distrust it somewhat, or completely distrust it?
5. How much do you trust television coverage of the same national event? Do you trust it completely, trust it somewhat, trust it a little, distrust it somewhat, or completely distrust it?
6. If you got conflicting or different reports of the same news story from television and the newspapers, which of the two would you be most likely to believe, television or newspapers?

Demographic information on age, gender, political affiliation, and income was compiled using questions asked annually on the poll. The poll was conducted October 27 through November 4, 1995. Three hundred eighty-six completed surveys were used for analysis. Sampling error was +/- 4.5 percent, and completion rate was 59 percent. Surveys were coded and the data analyzed using the SYSTAT program of statistical analysis. The first part of analysis involved a cross-tabulation of the six questions to obtain percentages of residents responding to each answer category. Results of the cross tabulations are listed in Table 1.

For the demographic profiles, question number six ("if you got conflicting or different reports of the same news story from television and the newspapers, which of the two would you be most likely to believe, television or newspapers?") was used to test against questions on age, gender, income, and political affiliation. In order to do this, a new variable was created to produce a dichotomous variable. Also, demographic questions on race, gender, and voter registration were dichotomized. An Analysis of Variance (ANOVA) was performed on the demographic variables (results on Table 2). A separate ANOVA was run on the two best models to test for significance (Table 3). Finally, a cross tabulation was performed for each demographic variable for comparison against the new conflict variable (Table 4).

Table One: Cross Tabs for Survey Questions

Question	Percentage Favoring TV	Percentage Favoring Newspapers
Where do you get most of your information about what's going on in the world today?	57.3%	24.4%
If you got conflicting or different reports of the same news story, which could you trust?	45.7%	28.9%

How much do you trust	Complete Trust	Trust Somewhat	Trust a Little	Distrust Somewhat	Complete Distrust
TV Coverage of an important local event?	7.4%	47.4%	22.2%	11.6%	4.9%
Newspaper coverage of the same event?	5.9%	46.2%	20.2%	14.1%	6.7%
Television coverage of an important national event?	11.9%	51.9%	17.5%	8.1%	4.4%
Newspaper coverage of the same event?	10.6%	47.4%	18.5%	11.4%	4%

Table Two: Analysis of Variance (ANOVA) test
for demographic variables

Variable	p value
Education	0.090
Age	0.852
Voter Registration (dichotomous)	0.983
Race (dichotomous)	0.621
Gender (dichotomous)	0.053
Income	0.946

Table Three: ANOVA after removal of non-significant variables

Variable	p value
Education	0.001
Gender (dichotomous)	0.080

Significance for tables- p is less than or equal to 0.05

· Table Four: Cross-Tabulations for Demographic Variables

Gender

	Female	Male
Trust Television	64.8%	54.9%
Trust Newspapers	35.2%	45.1%

p value = 0.090

Race

	White	Non-White
Trust Television	59.8%	67.9%
Trust Newspapers	40.2%	32.1%

p value = 0.405

Voter Registration

	Republican	Democrat
Trust Television	54.2%	57.9%
Trust Newspapers	45.7%	42.1%

p value = 0.632

Education

	4 Yr. College or more	Some College or 2-year degree	High School gradate/GED
Trust Television	72%	59.2%	48.8%
Trust Newspaper	28%	40.8%	51.2%

p value = 0.003

RESULTS

As Table 1 shows, television emerged as the medium chosen most often in the six questions on television and newspaper use, with 57.3% of respondents choosing television as the medium from which they get most of their news about world events. A majority of respondents also chose television as the most trustworthy in situations of conflicting or different reports. For the questions on media coverage of local and national events, a majority of respondents said they trusted both media "somewhat" in all situations. However, a greater percentage of respondents said they trusted television coverage of local and national events over newspaper coverage, and fewer respondents completely distrusted television coverage than newspaper coverage.

The inital ANOVA did not produce significant variables. Clearly, age, voter registration, and income were not factors in predicting trust in newspapers or television. The two variables whose p values were closest to being significant were removed from the set and run separately, to test if the "best model" would yield significant results. After the second ANOVA was performed, it was concluded that education level was the only significant variable in predicting perceptions of media credibility.

The cross tabulations for the demographic variables were used as a test (to prove that the other variables were not significant) and as a way to see how education affects perceptions of credibility. As Table 4 shows, the original conclusion that gender, race, and voter registration were not significant was proven correct. Also, the impact of education on perceptions of credibility was shown in a rather surprising manner. A majority of respondents with a four-year college degree or more were shown to trust television over newspapers, as were respondents with some college education or a two-year degree. However, the majority of respondents with a high school education or general equivalency diploma (GED) tended to trust newspapers over television. It is interesting to note that the greatest difference in percentages (72% and 28%) occurred in higher-educated respondents, with the percentage differences dropping substantially for respondents with some college education (59.2% and 40.8%) and high school graduates (48.8% and 51.2%)

DISCUSSION

The findings in this study were, in some respects, surprising and predictable in others. Respondents' choice of television over newspapers was in accord with previous studies. However, the results of the demographic profiles was not as predicted. The failure of the majority of variables to predict trust is easier to understand than the results of the education variable. Prior studies had suggested that respondents with higher levels of education would be more print-oriented and would therefore choose newspapers as more credible. However, the exact opposite was determined. It is the lower education brackett that favored newspapers. Reasons behind this can only be speculated about. Perhaps respondents with a high school diploma or GED now choose to read partisan newspapers, or those considered out of the "mainstream press." Or, perhaps a higher level of education denotes a greater level of cynicism towards the local daily newspaper. Certainly the reasoning behind the findings are an avenue for further research.

While the findings of this study echo results from previous research, they are unique in their limited geographical scope. While other studies have described research conducted on an undefined geographical area, this research concerns itself only with Buncombe County, N.C. Hopefully, the smaller size of the area being surveyed can give a better indication of the true feelings of the region.

The Evidentiary Impact of the Likelihood Ratio and Assessment of Diagnosticity

Nir Liberboim

Management Science and Information Systems Department
University of Texas at Austin

Faculty Advisor

Dr. Jonathan Jay Koehler

People often fail to make probabilistic inferences according to the rules of probability. This paper is concerned with people's ability to assess the strength of evidence and whether their assessments follow normative standards as given by Bayes' Theorem. An experiment was conducted to test the hypothesis that people violate the normative standard by placing excessive emphasis on the numerator of the Bayesian likelihood ratio rather than on the completed likelihood ratio. The results of the experiment generally supported this hypothesis.

BACKGROUND

It is often suggested that people have trouble understanding probabilities and using probabilistic information to form and revise their beliefs. Prior research has shown that people do not correctly adjust their prior beliefs in the face of new evidence as required by the rules of classical probability theory. Much research has focused on people's insensitivity to background probabilities or base rates relative to information that seems to be more directly relevant to the case under consideration. For example, studies have shown that people are likely to think that a target person is an engineer when provided with a description that is similar to a stereotype of an engineer even when they are also told that only a small percentage of the general population are engineers.

A related line of research has demonstrated that people fail to consider the probability of evidence given the alternative hypothesis, P(E|-H). However, probabilistic theory tells us that the value of new evidence is given by the ratio of P(E|H) to P(E|-H). A problem arises if people either know only one of these components or attach too much weight to one of them.

The Normative Model

Bayes' theorem provides a method for updating probabilistic beliefs when considering new evidence. For the phenomenon investigated in this paper, the appropriate normative model is the odds form of Bayes' theorem:

$$\frac{P(H|E)}{P(-H|E)} = \frac{P(H)}{P(-H)} \times \frac{P(E|H)}{P(E|-H)} \qquad (1)$$

P(H) to P(-H) refer to the probabilities that a hypothesis H is true and false respectively, prior to the presentation of evidence. These probabilities are commonly referred to as priors and their ratio is the *prior odds*. P(E|H) and P(E|-H) refer to the diagnostic value of the evidence E if hypothesis H is true and false respectively. The ratio of these two likelihoods is called the *likelihood ratio* and defines the probative value, or strength, of the evidence. Finally P(H|E) and P(-H|E) are the probabilities that the hypothesis H is true and false in light of the evidence E. The ratio of these two quantities, called the *posterior odds*, is computed by multiplying the prior odds by the likelihood ratio.

P(E|H) and P(E|-H) were previously defined as the probabilities of the evidence given hypothesis H and -H respectively. Notice that these two probabilities are the inverses of the posterior probabilities, P(H|E) and P(-H|E). For example, if you want to know the probability that it will rain given that the weather forecast indicates rain, P(Rain|Rain Forecast), then P(E|H) and P(E|-H) would refer to the P(Rain Forecast|Rain) and P(Rain Forecast|-Rain) respectively. The ratio of the former to the latter would represent the diagnostic value or evidence strength.

Bayes' Theorem as a Practical Application

Bayes' Theorem can be applied in a wide array of practical situations, as exemplified in Saks and Koehler's (1991) Bayes & AIDS problem.

One in every 250 Americans has the HIV virus that causes AIDS. The initial test that is used to detect the virus is known to be 97.7% accurate in the sense that 97.7% of those who actually have HIV will test positive for the disease, and only 2.3% of those who have HIV will erroneously test negative. It is also known that the false positive error rate of the test, or the rate at which the test will erroneously indicate that one who does not have HIV will test positive, is 7.4%. What is the probability that a person who tests positive for HIV actually has the HIV virus?

Most people believe that the answer to this problem is 97.7%, the accuracy rate. Bayesian analysis shows that the probability is much smaller. When we use Equation 1 to solve for P(HIV|Positive Test), we obtain:

$$\frac{P(\text{HIV}|\text{Positive Test})}{P(\text{No HIV}|\text{Positive Test})} = \frac{P(\text{HIV})}{P(\text{No HIV})} \times \frac{P(\text{Positive Test}|\text{HIV})}{P(\text{Positive Test}|\text{No HIV})}$$

$$\frac{P(\text{HIV}|\text{Positive Test})}{P(\text{No HIV}|\text{Positive Test})} = \frac{.004}{.996} \times \frac{.977}{.074} = \frac{.003908}{.073704}$$

$$P(\text{HIV}|\text{Positive Test}) = (.003908)/(.003908+.073704) = .05$$

A Bayesian analysis shows that the probability that a person who tests positive on the first test for HIV actually has the HIV virus is only 5%. At first, people are often bewildered by the Bayesian analysis and are skeptical about the answer that it provides. However, Figure 1 provides a more intuitive approach to understanding the accuracy of Bayesian analysis and its response to the Bayes & AIDS example. Notice that only 40 of 10,000 Americans have AIDS, whereas 9,960 do not. The implication of this imbalance is that even a very accurate test (such as the 97.7% accurate AIDS test) will yield a fairly large number of false positives (737) relative to the number of true positives (39). Hence, a large majority of positive test results will be false rather than true positives, and the chance that one has AIDS given that he or she tests positive will be small (39/776 = 5%).

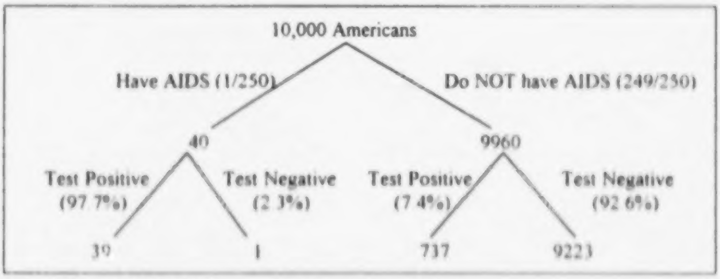

Figure 1. 'Bayes & AIDS' Diagram Yielding Bayesian Response

THE LIKELIHOOD RATIO

According to Bayes Theorem, the diagnostic value, or evidentiary impact, of new evidence is captured by the likelihood ratio, P(E|H)/P(E|-H). A likelihood ratio greater than 1 increases the chance that H is true whereas a likelihood ratio less than one increases the chance that -H is true.

In the Bayes & AIDS example, the likelihood ratio is the probability of a positive test given HIV divided by the probability of a positive test given no HIV, (.977/.074) = 13.2. Because the likelihood ratio is greater than 1 in this example, the evidence increases the chance that a person who tests positive for AIDS has AIDS relative to the prior odds of 1 out of 250. Importantly, when the likelihood ratio is used to assess the strength of the new evidence, both the numerator, P(E|H), and denominator, P(E|-H), must be taken into account as a proportion. A large numerator, P(E|H), is not necessarily indicative of high diagnosticity just as a small denominator, P(E|-H), is not necessarily indicative of high diagnosticity.

A Case of High P(E|H) and Low Probative Value

A common fallacy that people make is associating a large P(E|H) with high diagnosticity and high P(H|E) However, if the denominator of the likelihood ratio, which represents the probability of the evidence given the alternative hypothesis, is large as well, then the evidentiary impact of the new evidence may be minimal The reason that a high P(E|H), high P(E|-H) ratio can lead to low evidentiary impact is that the probability of the evidence E will be high regardless of whether hypothesis H or -H is used

A Case of Low P(E|H) and High Probative Value

Similar to the fallacy described above, there is a tendency for people to associate low P(E|H) with low diagnosticity If however P(E|-H) is less than P(E|H), the likelihood ratio can become quite large and probative Consider this example from Lyon and Koehler (1996)

The probability that a child contracts a venereal disease (VD) from sexual abuse, P(VD|Abuse), is only around 5% Does this mean that a venereal disease is not probative of abuse? Absolutely not Focus must also be placed on the denominator of the likelihood ratio which represents the probability that a child contracts a venereal disease given no sexual abuse This probability P(VD|-Abuse) is nearly zero, but we will assume a probability of 000001% for application sake The likelihood ratio is thus 05/ 00000001 = 5,000,000 Thus, here we have an example in which P(E|H) is low (05), and yet the completed likelihood ratio, P(E|H)/P(E|-H), is quite high (5,000,000) As this example shows, if people judge the strength of evidence based solely on P(E|H), they may assume that the evidence is weak when in fact, a likelihood ratio analysis reveals it to be quite strong

EXPERIMENT

Obviously, people do not usually conduct explicit Bayesian computations when reasoning about problems such as the AIDS problem But when the various terms of the prior odds and likelihood ratios are manipulated in an experimental setting, it is possible to see to which terms people's intuitive judgments are more or less responsible As indicated earlier, some research shows that people's intuitive judgments are not very sensitive to changes in the prior odds or base rates The present research shifts the focus to the likelihood ratio and considers whether people's intuitive judgment about the strength of incoming evidence will also violate Bayesian standards Specifically, people may be overly sensitive to P(E|H) and insufficiently sensitive to P(E|-H)

Overview and Method

This experiment tested the hypothesis that people are overly sensitive to P(E|H), the numerator of the likelihood ratio when making judgment about strength of probabilistic evidence As seen in the examples above, assessing diagnosticity based solely on the numerator of the likelihood ratio P(E|H) can lead to situations in which weak evidence is regarded to be strong and strong evidence is regarded to be weak

Subjects and Procedure

The participants in this experiment were 140 students in various marketing classes at the University of Texas at Austin They received extra credit toward their course grades for their participation This study was run over a two day period Subjects were run individually in groups of around 30 students Subjects were given two other unrelated experiments along with this experiment The experimental session lasted about 30 minutes

Materials

A single page (See Figure 2) on which the instructions, background, and questions were printed served as the materials for this study Subjects read about a virus among African tribesmen and were asked to identify the probability that a researcher contracted the virus in light of certain probabilistic information There were three versions of the study Version A, Version B, and Version C

As seen in Table 1, Version A contained a relatively high LR numerator and denominator (7, 5), and Version C contained a relatively low LR numerator and denominator (3, 005) Version B contained moderate values of the LR numerator and denominator (5, 05) The last column in Table 1 shows the strength of the evidence as given by the LR Notice that Version A contains the weakest evidence of the three despite having the largest P(E|H) value Version C contains the strongest evidence despite having the smallest P(E|H) If as predicted, people tend to judge the strength of evidence by focusing attention on P(E|H) rather than on

BEST COPY AVAILABLE

$P(E|H) P(E|-H)$, then the assessed evidence strength will follow the pattern Version A>Version B>Version C instead of the normative, or statistically correct, pattern Version C>VersionB>Version A

In order to ascertain the evidence strength that the subjects assessed, some algebraic manipulation had to be conducted The experiment did not directly ask for the evidence strength for the reason that subjects might confuse evidence strength with the posterior probability Instead, the experiment asked for the subjects' prior odds and posterior probabilities With those two pieces of information, subjects "implicit" LRs could be determined using the equation

$$LR = P(E|H)/P(E|-H) = (P(H|E)/P(-H|E)) * (P(-H)/P(H)) \qquad (2)$$

Instructions Please read the information and answer the corresponding questions in sequential order There are no right or wrong answers

Part I

Dr Howard Johnson, professor of anthropology at Minnesota University, received a large government grant to conduct research on the effect of various environmental and dietary changes on the red-spotted lizard In order to conduct his research, Dr Johnson decided to make a one month journey to the Mozambique jungle in Africa, where the lizard was originally discovered

Weeks after Dr Johnson's departure, his wife read about a rare virus that was found to have killed some tribesmen in South Africa -- 8,000 miles from Mozambique jungle Because the virus was spreading at such a low rate and the Mozambique jungle was far from South Africa, most experts believed that there was only a very small chance that the virus would spread to Mozambique within the next year On the other hand, all experts acknowledged that little is known about the virus and that it should not be taken lightly

Question 1 Given the information above, what would you say is the probability that Dr Johnson will contract the virus? _______%

Part II

Dr Johnson's wife decided to conduct some investigation on her own What were the symptoms of the virus? If her husband showed the proper symptoms, would that necessarily mean he contracted the virus? So the wife put her "Investigator" hat on and got to work

After some investigation, Dr Johnson's wife learned that the primary symptom of the virus was a serious rash Available data revealed that 70% of the South African tribesmen who had the virus had a serious rash However, 50% of the tribesmen who did not contract the virus also had signs of a serious rash

After Dr Johnson returned from his trip, his wife noticed that he had a serious rash

Question 2 Given that Dr Johnson had a serious rash, what would you say is the probability that he contracted the virus? _______% A

Figure 2 Experiment, Version A

Table 1 P(E|H), P(E|-H), and Likelihood Ratios of Versions A, B, and C

Version	P(E|H)	P(E|-H)	Likelihood Ratio (i e , Evidence Strength) P(E|H)/P(E|-H)
A	7	5	1 4
B	5	05	10
C	3	005	60

The normative evidence strength, as measured by the LR, is A<B<C

Results

As predicted, subjects assessed the strength of the evidence in the three versions in the pattern Version A>Version B>Version C This pattern was identical to the pattern of P(E|H) values However, this pattern was precisely the opposite of the pattern given by the likelihood ratios This supports the prediction that people's judgments about the strength of evidence are influenced more by P(E|H) values (i.e., LR numerators) than by P(E|H)/P(E|-H) (i.e., LRs). Figure 3 shows that the average assigned evidentiary strength values for Version A, B, and C respectively were 26.14, 8.59, and 4.78 whereas the normative evidentiary strength values are 1.4, 10, and 60 respectively. Note that as the evidentiary strength values rise, subjects assign declining evidentiary strength values because of their focus on the declining LR numerator.

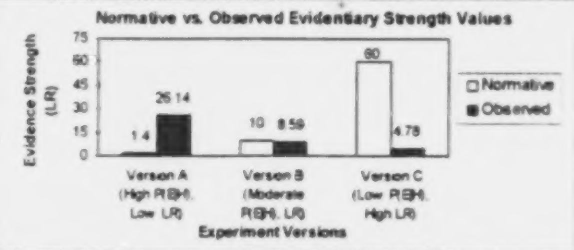

Figure 3. Confirmation of Over Sensitivity to LR Numerator

A t-test comparing the means of Version A and Version B revealed that these means were significantly different, $t(88) = 2.235$, $p<.02$ ($M_{Version A} = 26.14$, $M_{Version B} = 8.59$), while the t-test comparing the means of Version B and Version C did not reach significance, $t(88) = 1.415$, $p<.2$ ($M_{Version B} = 8.59$, $M_{Version C} = 4.78$). Though the comparison between Version B and Version C did not reach significance, the data in Figure 3 show that the assessed evidentiary strength values in Version B and Version C are in the direction that the hypothesis suggests. Perhaps with more data, significance between these two means can be reached as well.

CONCLUSION

The results of this experiment support the hypothesis that people focus on P(E|H) values when assessing the strength of evidence, rather than on the LR, P(E|H)/P(E|-H). When large P(E|H) values were combined with large P(E|-H) values, the strength of the evidence was low. However, subjects in this study judged the strength to be high, reflecting a focus on P(E|H) at the expense of P(E|-H). Likewise, when P(E|H) values were low and combined with low P(E|-H) values, the strength of the evidence was high. Subjects judged the strength to be low, reflecting a similar focus on P(E|H) at the expense of P(E|-H).

Though Bayesian analysis is counter-intuitive to many individuals, fallacies such as inattention to base rates, inattention to P(E|-H), and excessive attention to P(E|H) can lead to astonishing statistical implications and poor judgment and decision-making.

ACKNOWLEDGMENTS

The author wishes to express his appreciation to Dr. Jonathan Jay Koehler for his counsel and assistance.

Solitary Confinement
A Study of Prisoners' Access to the News Media

Ann Marie Major

BACKGROUND

In 1994, there were more than one million prisoners in United States' correctional facilities (Statistical p.219). It is a collection of people comparable to the population of several small countries including Gabon, Swaziland and Oman. Of that number, more than 90 percent were inmates at state institutions, while the remaining 80,000 served their sentences in federal prisons (Statistical p.219).

In late 1995, the California Department of Corrections enacted an emergency ban on face-to-face interviews with prisoners by anyone other than family, clergy or the inmates' attorneys. The media's glamorization of prisoners and prison life, as well as the inherent safety compromises of such reports, were given by the CDC as the reasons for the ban (News p.12). Following more than a year of administrative wrangling and public hearings, the ban remains in effect. Some California lawmakers are now moving to enact legislation to prevent the permanent adoption of the proposed CDC regulations (Lawrence).

In Pennsylvania, the story has been much the same. Effective on November 11, 1996, all face-to-face interviews with prisoners were banned. In addition, all recording devices, including cameras and tape recorders, were prohibited (Commonwealth).

In both states, prisoners must now write or call collect to contact the media. In order to meet journalists face-to-face, inmates must place them on their personal visitation list -- a painfully slow bureaucratic process. Yet, journalists in Pennsylvania should rejoice because they can continue to enjoy the luxury of bringing a pencil and paper to their meetings with inmates (Commonwealth). In California, reporters can bring nothing (News p.13). They must write their stories completely from memory.

CASES

Contrary to what many Americans believe, prisoners have rights. They do not lose all of their rights when they commit a crime or serve their sentence. "A prisoner retains all the rights of an ordinary citizen except those expressly, or by necessary implication, taken from him by law" (Coffin v. Reichard, 143 F.2nd 443, 444-445). In case after case, courts have recognized that prisoners retain constitutional protections despite their confinement (Cooper v. Pate, 378 U.S. 546, Brown v. Peyton, 437 F.2nd 1230, Bell v. Wolfish, 441 U.S. 520, Turner v. Safely, 482 U.S. 84). One of their protections is embodied in the First Amendment right to free speech.

In 1974, the Supreme Court heard arguments for several cases that went a long way in shaping prisoners' First Amendment rights, as they pertain to inmates' access to the news media. In the first of these cases, Procunier v. Martinez, 416 U.S. 396, the Supreme Court established a strict scrutiny test designed to insulate inmates' rights from unwarranted government intrusion. However, the initial fortified protection of prisoners' rights provided by this ruling would be confounded and eventually rendered nearly meaningless. The confusion following Martinez began with Pell v. Procunier, 417 U.S. 817, and was finally resolved, to the dismay and protest of journalists, in Thornburgh v. Abbott, 490 U.S. 401.

In Martinez, several prison inmates brought a class action against Procunier, then director of the California Department of Corrections. Among other grievances outlined in their complaint, the prisoners challenged the censorship of prisoner mail by the CDC. The correspondence of these inmates with other inmates and with the outside world, other than their attorneys and public office holders, was subject to prison censoring. Moreover, prison rules defined letter writing by prisoners as "a privilege, not a right . . ." and discouraged written letters which "unduly complain" or "magnify grievances." In addition, prison rule flatly prohibited writings that were politically, racially or religiously inflammatory, as well as letters received by the inmates which "pertained to criminal activity, are lewd, obscene or defamatory, contain foreign matter, or are otherwise inappropriate" (416 U.S. 396-400.) Protecting the prisoners' First Amendment rights, the District Court found for the prisoners and enjoined further censorship. The Supreme Court affirmed the District Court's decision.

Justice Powell, writing for the Court, began by asserting that the Court should avoid acting as prison administrators. However, Powell justified the Court's review of the case. "When a prison regulation or practice offends a fundamental constitutional guarantee, federal courts will discharge their duty to protect constitutional rights" (Id., at 405-06). This is an important point which clearly defines the Court's role as a judicial arbiter and protector of the people's fundamental rights from unwarranted governmental intrusion.

In his opinion, Powell defined the issue before the Court as one centering on the appropriate standard of review for censoring prisoner mail. In defining the issue before the Court, Powell admitted that the courts had been less than consistent in their decisions on the appropriate "standard for testing the constitutionality of prisoner mail censorship ... Our task is to formulate a standard of review for prisoner mail censorship that will be responsive to these concerns" (Id., at 407).

In doing so, the Court began by recognizing that it was not just the rights of prisoners that were being invaded, but also those with whom they were corresponding. In effect, censorship of prisoner mail restricted the First and Fourteenth Amendment rights of the persons outside of the prisons who received the inmates' letters (Id., at 409). The rights of these individuals, the Court said, must be weighed against the interests of the government. As a penal institution, the Court recognized several governmental interests, including "... the preservation of internal order and discipline, the maintenance of institutional security against escape or unauthorized entry, and the rehabilitation of the prisoners" (Id., at 412).

By balancing these interests against each other, the Court developed a test. "First, the regulation or practice in question must further an important or substantial governmental interest unrelated to the suppression of expression." The interests the Court previously defined were security, order and rehabilitation. And, "second, the limitation of First Amendment freedoms must be no greater than is necessary or essential to the protection of the particular governmental interests involved" (Id., at 413.) Thus, by using this test to affirm the Appellate Court's decision, the Supreme Court determined that the government failed to demonstrate the need to censor prisoner mail to preserve security, order or rehabilitation. In short, the prison regulations were too broad.

The Court decided another closely related case just months after the Martinez ruling. In Pell v. Procunier, 417 U.S. 817, several journalists and inmates again brought suit against the CDC for a ban on face-to-face interviews with prisoners. Justice Stewart, writing for the Court, began where Martinez had left off -- by balancing the institution's penological interests against the inmates' rights (Id., at 822). The Court went on to determine that because Martinez protected letters written by prisoners to journalists, a ban on prison interviews did not interrupt the flow of information. "Thus, it is clear that the medium of written correspondence affords inmates an open and substantially unimpeded channel for communication with persons outside the prison, including representatives of the news media" (Id., at 824). Moreover, the Court asserted that the press had no greater right to conduct interviews with inmates than did the public (Id., at 831).

Thus, the majority opinion in Pell was a setback for journalists, prisoners and the public. Still, there was some solace in the dissenting opinion of Justice Douglas, who was joined by Justices Brennan and Marshall. In the dissent, Douglas began by challenging the Court's treatment of prisoners' rights. "Prisoners are still 'persons' entitled to all constitutional rights unless their liberty has been constitutionally curtailed by procedures that satisfy all the requirements of due process ..." (Id., at 837). He further criticized the decision in light of the necessary role of the press to act as the eyes and ears of the public, especially where the government is concerned. Douglas quoted from his dissent in Branzburg v. Hayes, "The press has a preferred position in our constitutional scheme ... to bring fulfillment to the public's right to know. The right to know is crucial to the governing powers of the people" (408 U.S. 665, 721). Therefore, the press has a responsibility to provide information to the people. As Douglas states, certainly crime and the country's penal institutions, which are supported by public tax dollars, are of interest to the people (817 U.S. 840). In essence, Douglas stated that restricting the flow of information from prisoners curtails the power of the people.

The Court's decision was criticized further in Powell's dissenting opinion in a case decided on the same day as Pell. Saxbe v. Washington Post Co., 417 U.S. 843, was a case similar in fact to Pell, which is the reason Powell applied his dissent to both Saxbe and Pell.

Saxbe was a case brought specifically by the media, which challenged regulations that prohibited inmate interviews at federal medium and maximum security prisons. The Court again avoided nailing down a standard of review for prisoners' rights by deciding the case based on the principle that the media have no greater right of access to prisons than the public.

Powell, joined by Brennan and Marshall, found that the Court's decision allowing a ban on media interviews with prisoners "impermissibly burdens First Amendment freedoms" (Id., at 850). Powell began by recognizing the importance of face-to-face interviews with inmates. Personal contacts with inmate sources facilitates a reporter's evaluation an inmate's credibility. Powell added that alternatives to interviews were not comparable. ". . . [C]orrespondence is decidedly inferior to face-to-face discussions as a means of obtaining reliable information about prison conditions and inmate grievances" (Id., at 855).

Perhaps more important to journalists, Powell criticized the Court for essentially allowing any governmental restriction on press access to information. In Branzburg, Powell argued that while the Court held that there was no First Amendment right to gather news, the Court also recognized that the government cannot broadly restrict the media from obtaining newsworthy information (Id., at 859).

Similar to Douglas' dissent in Pell, Powell asserted that the public has a genuine interest in the conditions and operations of prisons. "What is at stake here is the societal function of the First Amendment in preserving free public discussion of governmental affairs" (Id., at 862). In other words, Powell stated that a Core Value of the Constitution was at stake in this case -- the right of the public to openly and freely criticize the government.

Powell went on to define the press as "agents of the public at large" (Id., at 863). Thus, the press facilitates the exchange of ideas, especially in areas not easily accessible to the public. "For good reasons, unrestrained public access is not permitted. The people must therefore depend on the press for information concerning public institutions" (Id., at 864).
